The CHAIRMAN. Is it in the line of your customary duties to do this thing? I mean, to do a thing of this kind? Is that a common ordinary practice of yours?

Mr. DUNSWORTH. To label a bottle?

The CHAIRMAN. Yes.

Mr. DUNSWORTH. We have labeled quite a few bottles, yes. I have labeled quite a few bottles.

The CHAIRMAN. When you say "quite a few," can you give us some idea of the number a day, the number a week?

Mr. DUNSWORTH. Well, it could be maybe two a week or something of that sort, in the period of my employment there.

The CHAIRMAN. What is your name, sir?

Mr. FIELDS. Paul Fields.

The CHAIRMAN. What are your duties?

Mr. FIELDS. Well, I am a group leader in the laboratory, and one of the duties of our group is service work, and if I give you a little background, perhaps, at least of how I got my writing on this—

The CHAIRMAN. Yes. Speak up now.

Mr. FIELDS. How I was in a position to recognize the bottle was this material which had resulted from the machining of the uranium was gathered together apparently by Mr. Dunsworth, and there was a little material in some oil, which the metallurgical people could not quite recover, and I was asked to get this material out of the oil, and I received both this bottle containing the 284 grams, and this material in oil, which I recovered and purified, and added to the 284 grams.

Then, I reweighed the bottle and the contents to give the total amount, the new total amount of the uranium, and I put my new notations in the upper right-hand corner of the bottle, so that the next person who received it would know that was a change in weight, and when I was questioned about it, I said that I had put this notation in the right-hand corner of the label, and when the bottle was found I found my penciled notation up there; it was in my writing.

The CHAIRMAN. What was that notation?

Mr. FIELDS. Well, there was the weight of the bottle, plus the uranium.

The CHAIRMAN. Do you remember what that was?

Mr. FIELDS. It was 590. The new weight of uranium—that was 289 grams, and both of them were there; the papers which I had filled out sending the material back to metallurgy stated that there was now 289 grams, and that weight corrected the figures on the bottle, the weight had come in to me as 284 grams, and that was also on the bottle.

The CHAIRMAN. Where did you see this bottle for the first time after it was dug up?

Mr. FIELDS. In Dr. Zinn's office. Mr. Paxman was there, and he took it out of a box and asked me to look at it, and it did not strike any note until I looked at the label, and then I identified my figures, and they have been just what I said they probably were, and it was the figures I had claimed I put on there.

The CHAIRMAN. So, the bottle in question was the bottle you say that—

Mr. FIELDS. I passed on to metallurgy coming to me.

The CHAIRMAN. And this was in your handwriting?

Mr. FIELDS. Yes.

The CHAIRMAN. Any questions?

Senator HICKENLOOPER. Mr. Fields, do you recall, when you saw the bottle in Dr. Zinn's office, that that was the bottle that you had put your figures on?

Mr. FIELDS. I recall just the label.

Senator HICKENLOOPER. I see.

Mr. FIELDS. I have been quizzed as to how the bottle looked, and I just did not remember. I get hundreds of bottles but the label—

Senator HICKENLOOPER. I just wanted to clear that up, because it is reported that you said that you could not recall the particular bottle, but you did identify the figures in one corner as your writing.

Mr. FIELDS. Yes. I had told them before that I had these figures added on to the label.

Senator HICKENLOOPER. Yes.

I think that is all, Mr. Chairman.

The CHAIRMAN. Thank you very much.

Senator HICKENLOOPER. I wanted to talk to Mr. Dunsworth.

The CHAIRMAN. I beg your pardon.

Senator HICKENLOOPER. If I may.

The CHAIRMAN. Certainly, Senator.

Senator HICKENLOOPER. Mr. Dunsworth, do you have a clear recollection of handling this bottle?

Mr. DUNSWORTH. No, none at all.

Senator HICKENLOOPER. I believe you stated just a moment ago that you felt that some of the figures on the bottle were in your writing, is that correct?

Mr. DUNSWORTH. That is correct.

Senator HICKENLOOPER. And you determined that after having seen the bottle that was dug up from the dump with the figures on the label?

Mr. DUNSWORTH. That is right.

Senator HICKENLOOPER. And you recognized your own writing on the bottle?

Mr. DUNSWORTH. Yes.

Senator HICKENLOOPER. I merely suggest that because in the record of the investigation, in which you were interviewed, I find no reference

whatsoever to your belief that any of these figures were yours. I do not question your statement now. You certainly ought to be able to recognize your own writing, but this was after the bottle had been found, and in the record of talking to you about the matter, as I say, I find no reference in here to the fact that at that time you mentioned anything about the part of the figures being yours on the bottle.

Mr. DUNSWORTH. What does it say in the record as to what I said?

Senator HICKENLOOPER. Well, you discussed what was the probable operation. I would be glad to have you see this; I just do not want to quote directly from these records. Now, you may read these two paragraphs.

Mr. DUNSWORTH. It discusses the operation of converting turn-  
ings—

Senator HICKENLOOPER. I think it would be only fair if you read the two paragraphs. Would that be all right?

The CHAIRMAN. Surely.

Senator HICKENLOOPER. Because I do not want to quote directly from this. I assure you that, as far as I can find, these are the only two paragraphs referring to you there.

Mr. Dunsworth, please do not misunderstand me, I am not questioning your identification of your handwriting, but I am concerned with the exactitude of some of these investigations and the information developed, and while it is noted that you have handled this bottle, that is, could have very easily, I just noticed no mention of the fact that there was a claim that any of these figures on the bottle were your figures.

Again I want to make clear that I am in no way questioning your statement that they are your figures. I do not question that at all.

Mr. DUNSWORTH. The statements you have there were taken at an earlier date than when I made the notation about the figures being on there. Do you see those paragraphs—

Senator HICKENLOOPER. This is dated the 27th of May.

Mr. DUNSWORTH. Of course, that does not give you any indication as to when I was actually interviewed on that subject, does it?

Senator HICKENLOOPER. It is the period from the 24th of May to the 27th of May; that is during that period.

Mr. DUNSWORTH. The interview period?

Senator HICKENLOOPER. It was during that period when the interview is bracketed, between those two dates, and the entire report seems to be predicated upon a further inquiry after the bottle had been discovered, so I just assume that all of these inquiries were after the bottle had been discovered because there is an earlier investigative report of the various authorities prior to the time of the actual discovery of the bottle.

You certainly can identify your own writing, and I raise no question about that either way, you or Mr. Fields.

The CHAIRMAN. Mr. Dunsworth, you saw this bottle on a number of occasions since it has been dug up?

Mr. DUNSWORTH. No, the only time I saw it was after this interview in question.

The CHAIRMAN. After this interview. Now, it was testified by Dr. Zinn this morning that the bottle had to dry out, the label had to dry out. When you saw the label, was it dry?

Mr. DUNSWORTH. Yes; I saw it after it had come back from Washington.

The CHAIRMAN. You saw it for the first time after it came back from Washington?

Mr. DUNSWORTH. Yes.

The CHAIRMAN. That is when you made your identification of your own handwriting?

Mr. DUNSWORTH. Yes.

The CHAIRMAN. Thank you. Are there any further questions?

Thank you very much, gentlemen.

Mr. Borden?

Mr. William Borden, who is director of the staff of the Joint Committee on Atomic Energy.

Mr. Borden, pursuant to my instructions, you and Mr. Heller went to Chicago?

**STATEMENT OF WILLIAM L. BORDEN, EXECUTIVE DIRECTOR,  
JOINT COMMITTEE ON ATOMIC ENERGY**

Mr. BORDEN. That is correct.

The CHAIRMAN. As Dr. Zinn testified this morning?

Mr. BORDEN. Correct.

The CHAIRMAN. What date was that?

Mr. BORDEN. That was about May 20. We left on a Thursday which, I think, was the 20th.

The CHAIRMAN. And you conferred with Dr. Zinn when you got there?

Mr. BORDEN. Yes, we did, Mr. Chairman.

The CHAIRMAN. And with others?

Mr. BORDEN. With a number of other people at Chicago.

The CHAIRMAN. Now, Mr. Borden, did you bring back a bottle with you to Washington?

Mr. BORDEN. Mr. Chairman, I not only brought back a bottle, I brought back pictures which were procured at the request of Mr. Heller and myself. I brought back photostats of some of the relevant documents, and in addition I brought back the facsimile or duplicate bottle which had contained uranium oxide and over and above that, to compound a number of bottles involved here, I brought back a little vial which contained an amount of material in it which represented or simulated by volume the amount of U-235 which was not accounted for.

The CHAIRMAN. Now, will you tell us how this bottle incident arose?

Mr. BORDEN. Surely.

When Mr. Heller and I visited Chicago, we thought that it might have been incumbent upon us when we returned to make a personal report to the committee. We felt that it might assist the committee if we had with us graphic and visual aids; that such aids would tend to make tangible and comprehensible the kind of problem that was involved.

With that thought in mind we procured a photographer to accompany us to the various sites when we were in Chicago, and to take pictures of relevant vaults and other items that figured in the story.

The CHAIRMAN. He was cleared, I hope?

Mr. BORDEN. He was cleared; yes. [Laughter.] My understanding was that he was a member of the Chicago Operations Office of the Commission.

In addition to that, I expressly requested from Dr. Zinn a bottle which would more or less indicate the order of magnitude involved. I thought that it might be helpful to show that this facsimile or dummy bottle, representing one which had been lost, was not this big [indicating], or so big [indicating], but rather this big [indicating].

I did not have any particular color or legend on the label in mind, but I did think that to have something tangible to show to the committee along this order would be helpful.

When Dr. Zinn, in executive session, testified the following Monday, the bottle was produced at my request and passed around among the committee members. I think in all fairness I ought to say that any blame for confusion that may have arisen because of the production of this dummy or duplicate bottle is completely and solely attributable to me and my request in Chicago.

The CHAIRMAN. You did not specify any color when you asked for this sample bottle?

Mr. BORDEN. My recollection is not completely clear on the point. I think I did, because it had been said in various conversations that had been held in Chicago that the bottle could have been or could well have been or was possibly a brown bottle. There seemed to be a plethora of brown bottles at site B, where the actual bottle in question had been stored at one time, and so that was the color that turned out to characterize the dummy we brought back.

The CHAIRMAN. Dr. Zinn was generous enough to state this morning that it was you who made the suggestion that the dump be examined, which suggestion has resulted in the digging up of the bottle. You did make such a suggestion?

Mr. BORDEN. There was considerable conversation on that point; yes, Senator.

The CHAIRMAN. Well, Mr. Borden, for my part I certainly have no criticism of the unfortunate confusion that resulted, because I think it is easy to understand that in the light of all the facts now.

Are there any questions?

Senator HICKENLOOPER. No questions.

Senator KNOWLAND. No questions.

The CHAIRMAN. Thank you.

Now, Dr. Thiele, would you mind going out and taking the chair, please?

Doctor, will you give your name to the reporter in full?

# **STATEMENT OF DR. ERNEST W. THIELE, ASSISTANT DIRECTOR OF RESEARCH, STANDARD OIL CO. OF INDIANA**

Dr. THIELE. Ernest W. Thiele.

The CHAIRMAN. Doctor, you are connected with the Standard Oil Co. of Indiana?

Dr. THIELE. I am assistant director of research at Whiting, Ind.

The CHAIRMAN. For how long have you been connected with that company?

Dr. THIELE. About 24 years.

The CHAIRMAN. Would you mind giving us your educational background?

Dr. THIELE. Well, I received a degree of A. B. from Loyola University in Chicago; following that a degree of B. S. in chemical engineering at the University of Illinois; and degrees of M. S. and S. D. D. from Massachusetts Institute of Technology, the latter also in chemical engineering.

The CHAIRMAN. Doctor, as a result of a request that I made on behalf of the committee to Dr. Wilson, the president of Standard Oil Co. of Indiana, were you, with your consent, assigned to conduct an investigation of the facts relevant to this reported loss at Chicago for this committee?

Dr. THIELE. Yes, sir; mainly the technical facts.

The CHAIRMAN. That is right.

Now, Doctor, fortunately you have been here when Dr. Zinn testified, and you know that we are interested in all of the testimony that we can produce relating to the matter, and particularly to the recovery of this loss.

Will you please tell us what you have done in connection with your work on it?

Dr. THIELE. Well, I mainly was to discuss the discrepancy of 4 grams, and so forth. There is another aspect of it leading to, relating to the inventory, which probably would, judged from what was said this morning—could not be very well discussed in a meeting like this.

Do you want me to go on?

The CHAIRMAN. Yes, go right ahead, Doctor.

I might say for the record that you have a Q clearance from the Atomic Energy Commission in regard to the work to which you were assigned.

Dr. THIELE. Yes, sir.

The CHAIRMAN. And of course, you are aware of the limitations of security, and you will proceed within those limitations.

Dr. THIELE. I hope so. [Laughter.]

The CHAIRMAN. So do I. [Laughter.]

Dr. THIELE. First, with regard to what was lost, the question there would be to find out, as nearly as possible, how much uranium 235 was in the bottle which disappeared.

After looking it over, I do not have anything much to change with regard to what has already been quoted. There cannot be any doubt that the scales used to weigh the amount of material were quite accurate enough for this purpose.

The analysis for the uranium which was conducted at the new chemistry laboratory was done by a method which would be suitable for material of this character. It was a proper preliminary investigation as to possible interfering substances, so that I think, and also the analysis was made in triplicate, giving closely accorded values, so that the figure 82.3 is probably as far as we can judge after a period of 2 years—there is no possibility for a check—quite a good figure.

It is difficult to assign limits of error to analyses. I would think, however, that an error of 1 percent probably should not be exceeded. It is very probable that it was within those limits.

There is some auxiliary evidence as to the weight contained in the bottle because you can trace back the history of the original billet

from which the shavings were made, and by deducting the other materials which were found, you can arrive at a fairly good idea of the probable losses, and those appear to me to be within reason for an operation which was conducted only once. They are perhaps a little large if you were to operate that way on a continuing basis.

Then, there remains the question of the isotopic composition. That is a separate analysis, and that can be checked because there was reserved a small sample in the new chemistry laboratory which has since been determined by two different laboratories—one by Oak Ridge, and one other result—which is closely accorded, although I do not have the exact figure before me since it was obtained only very recently, and those agree as well within limits with the supposed composition of the original billet from which the material was made, so that, to sum it all up briefly, it seems to me that the weight of uranium 235 which was in this jar must have been very close to 31 grams, probably a very high probability insofar as you can see by such an after-investigation—not more than a half gram either way would probably be a liberal allowance for possible various erratic errors.

Then, taking on the other side the large waste can in which the enriched material was found, that was sampled first at the Argonne Laboratory, and five small samples were taken, and one of the samples, together with the original can, was then sent down to Oak Ridge.

I was down at Oak Ridge to examine what was done with the can there. I find that they are very well equipped to do the kind of work that needed to be done. They have a special room for it, and it is a part of their regular business to deal with materials of this sort. They have excellent scales, and the operator was said to be an experienced man. I have no doubt that was the case.

Contrary, however, to what Dr. Zinn said, the material was not all brought into solution at that point. After five additional small samples had been taken out, an attempt was made to bring them to solution and the greater part of it was made into a solution which was fairly bulky.

There was a residual solid material which did not respond to this treatment. Both the small samples, the extra sample which was sent down, extra sample which was sent from Argonne, and the two large lots, one of solid and one of liquid, were analyzed at Oak Ridge.

The methods used in the analysis for uranium had been largely developed by the Atomic Energy Commission or, perhaps, it would be better to say by the Manhattan District, and the Oak Ridge people have had a large amount of experience in making such analyses, so that as far as could be judged by a person who does not have and cannot have special experience in this field, the analyses made there should be good analyses.

With one exception they should be good analyses, and that was that I considered that the method used for the isotopic analysis of the solid was open to objection. While an error appeared unlikely, there might have been one, and it might have been one of any size. Apparently the Oak Ridge people had realized this, and they had, while I was down there, already made preparation to make another analysis of the solid. I do not know whether this had been done.

Then, you have to evaluate the accuracy of the analyses which they made. If we took the statements available in the literature

as to the accuracy of the uranium analyses, there would be a situation where it would be quite high, very high, a tenth of 1 percent—1 percent of the amount of uranium which was determined. Probably one cannot expect that in the normal course of analyses and without very special precautions that the full possibilities of the methods used could be obtained, and I find it somewhat difficult to decide what the limit of error would be.

For this reason, and because the question of the discrepancy turned very largely on the analysis particularly of the large bulk of solution, I suggested to the Oak Ridge people that they should make another analysis, a comparison of the two, which would give at least some idea of the probable erratic errors that would arise and probably form a basis for evaluation; and furthermore, since this was important, I asked them to send a sample up to the Argonne Laboratory to have analyses made by their methods there. The former analysis I have not obtained. I do not know actually whether they have gone ahead to do it, but, as Dr. Zinn said this morning, the analysis made at the Argonne Laboratory was quite considerably higher, outside of the limits—on the isotopic concentration—outside of the limits which the people at Oak Ridge had suggested their experience showed should be the case.

However, the mass spectrographic analysis is subject to erratic errors arising from the fact that the previous analysis made in this equipment tends to affect subsequent analyses. This was pointed out to me, particularly by Dr. Ingraham, who is—who does work for and is partly connected with the Argonne Laboratory, and who was one of the developers of the instrument in which the mass spectrographic work at Argonne was done, so that the fact that there was a larger discrepancy was—I will not say in accordance with his predictions, but at least consistent with what he suggested the limits of error should be.

But I have not had time, of course, to state exactly what the result of this latest analysis of the material in the can will do, but I believe that since the point is rather important, further analyses of this can are indicated, and I presume they would be made.

The CHAIRMAN. They are being made, I am informed, Doctor.

Dr. THIELE. There is, however, one further point, but before I go to that, I would say that I think where this leaves it is that you have here an indication that some part of the discrepancy may possibly be eliminated.

There is another point which I have been following up, which is a little different and really refers, you may say, to the calculation. You see, what you determine in the garbage can is simply the amount of, the total amount of uranium 235 that is present in order to determine how much of the enriched material came from the bottle or elsewhere. The assumption has been made that the rest of the material which was in this can, the uranium, was normal uranium, which contains certainly a much smaller proportion of uranium 235.

Now, it turns out that in the month previous to the month in which—in October of last year, they were working up in the metallurgical department at Argonne some depleted uranium, that is, uranium from which nearly all of the U-235 had been removed.

The CHAIRMAN. Now, in the natural state that is seven-tenths of 1 percent?

Dr. THIELE. Approximately seven-tenths of 1 percent.

The CHAIRMAN. You are talking about this material, that seven-tenths had been—

Dr. THIELE. Well, I doubt whether they know very accurately, but probably 90 percent had been removed. It was mostly gone. This billet was received about October 5, and it was machined, and the records show that the 810 grams of the material were lost as chips in the machining operation. There was a machine to make them into square blocks. Then these blocks were to be further fashioned, and while this was being done on the first one, an explosion occurred which burned an operator slightly, and caused the block to be useless for further work, and it was also scrapped, so that in all there were presumably scattered among the scrap uranium of normal composition something approaching 1,500 grams. I do not have the exact figure. There was something approaching 1,500 grams of this depleted material. This was in October.

One can of waste was taken out of the Metallurgy Laboratory, according to the records at the end of that month, and this can No. 3, in which most of the material appeared, was taken out at the end of November. It seems, therefore, on the whole, to be considerable possibility that some of the depleted uranium found its way into this can No. 3, and if so, to the extent that that took place, the enriched uranium would, so to speak, be soaked up, and its excess U-235 composition would be used in making normal uranium out of depleted uranium, if I can express myself in that way.

Senator HICKENLOOPER. Do you mind being interrupted, Doctor?

Dr. THIELE. Not at all.

Senator HICKENLOOPER. Do you have the date in October when this explosion occurred, or the approximate date?

Dr. THIELE. It was the 22d of October. The medical department records show that that was the case. Two men had to go to the hospital.

Senator HICKENLOOPER. Yes. But the point is that if this depleted uranium had been worked on, and then ruined or something for further use and had been scrapped, it probably would have gone into the October waste can, would it not, rather than in the can that was used for the November waste?

Dr. THIELE. Presumably so.

Senator HICKENLOOPER. And the one that was used for the November waste, as I understand it, was can No. 3?

Dr. THIELE. That is right.

Senator HICKENLOOPER. So that the depleted material probably would be in the can that preceded the one in which excess U-235 was located?

Dr. THIELE. Yes. Of course, we cannot now find out just how they dealt with the material on the floor, wherever it may be, so that I do not see any way now of arriving at really a history of the thing, and so far, it may be said that we do not have any affirmative evidence of the presence of any depleted uranium in can No. 3. I would like to go into that a little further.

Of the 12 cans which were checked, were awaiting shipment to Philadelphia, only this can No. 3, so far, has been analyzed and examined by Oak Ridge, but the other 11 cans are down there and they

are working on them. So that we may, from the isotopic analyses of these cans, perhaps, get an idea of where the depleted uranium is.

In theory, presumably you could make a balance of the thing. I am not too hopeful that anything very accurate can be obtained.

There are also the additional four "thief samples," which were taken at the Argonne. They have been examined only by a very inaccurate qualitative method, and while the other six "thief samples" which were taken from can No. 3 showed either normal uranium or an excess, still only one of those six showed any considerable excess, and it seemed to me worth while to have Oak Ridge get an isotopic analysis on the remaining four in the hope that possibly some depletion could be found.

If any depletion which is below the limits of analytical error can be found, it would be proof, really, I believe, that some, no definite quantity, can be said—some of the depleted uranium—was in this can No. 3. If nothing is found, our experience with the enriched uranium shows that you cannot really infer very much from it.

What ought to be tried is to make a balance of all the 12 cans and see how much, if anything, of depleted uranium could be attributed to can No. 3. At any rate, there seems to be a possible explanation of the discrepancy.

In addition, as I said before, the analyses require some further study.

Senator HICKENLOOPER. The net result, then, Doctor, is that we do not know any more now than we did; is that about it, except theory?

Dr. THIELE. We do not know any more for sure now than we did.

Senator HICKENLOOPER. Yes. That is all.

The CHAIRMAN. Are there any further questions?

Doctor, that is all, at least for the present time, except that I should say—I know that you know this—that the further analysis and experimentation is going forward on this matter.

Can you tell me from your knowledge when it would be finally completed?

Dr. THIELE. Well, that will depend on the work at Oak Ridge, I believe. I do not really know how far along they are. We have asked them to do a number of things, and I presume it will be a little while before they are through.

The CHAIRMAN. Have you requested that these 12 cans, if they are still available, be examined to find out if they contain—

Dr. THIELE. That was requested before I came on the scene, and that is being done. There is no question but that will be obtained.

The CHAIRMAN. I see.

Dr. THIELE. No doubt all the work will be done.

The CHAIRMAN. I see.

Dr. THIELE. But that is quite a job, and they have to carry on their regular business, of course.

The CHAIRMAN. Yes. Thank you very much, Doctor.

Senator HICKENLOOPER. May I ask just one question that I overlooked?

The CHAIRMAN. Yes.

Senator HICKENLOOPER. Did I understand you correctly, Doctor, to say that you believed that a 1-percent error was a tolerable error in examination of these products for the location of this material?

Dr. THIELE. Well, every analysis will have a different probability of error.

Senator HICKENLOOPER. Yes; but I understood you to use the term "1 percent."

Dr. THIELE. Yes; that is right; that was the reference to the jar.

Senator HICKENLOOPER. You believe that they should be able to locate this material within 1 percent of what was actually there?

Dr. THIELE. Oh, you mean—the way things stand now, I think it is questionable whether you can in the case of the can, considering that you have a large bulk of material and only a small amount of enrichment; I think it is hopeless to attain that. The difficulties of what they have to do to form the best evaluation are what really is to be considered a really probable limit, but I hardly think that 1 percent can be attained in that case.

Senator HICKENLOOPER. Did you have an opinion on that, at the moment?

Dr. THIELE. What would be a limit?

Senator HICKENLOOPER. Do you have an opinion as to what would be an unreasonable limit?

Dr. THIELE. I would think before we got through it would certainly be plus or minus 5 percent—well, maybe not quite that good. It is a little—

Senator HICKENLOOPER. Oak Ridge, I believe, says it is plus or minus 4.2 percent.

Dr. THIELE. I beg pardon?

Senator HICKENLOOPER. Oak Ridge has indicated that the probable error they believe is plus or minus 4.2 percent. I do not mean to hold you to an exact percentage, but do you believe that is substantially a reasonable error limitation?

Dr. THIELE. Well, in the over-all, yes; but I may say that I do not think I quite see eye to eye with Oak Ridge on their possibilities of error. I believe they have given too liberal limits in the uranium analyses and not liberal enough in the isotopic analyses; the two have to be more closely tied together.

Senator HICKENLOOPER. Well, the figures on which I based my suggestion were based on 31 grams of U-235 and a 1.3 limitation of probable error, plus or minus, which, as I calculate it, is 4.2 percent.

Dr. THIELE. Well, 31.0; yes. I think I should say one thing further, and that is that if we are going to have to bring in—if it seems proper to say—the depleted material, it becomes much more difficult to get down to a fine point because the depleted material is scattered among other cans, and that further dilutes your accuracy in a way which is hard to follow up.

Senator HICKENLOOPER. That is all, Mr. Chairman.

The CHAIRMAN. Thank you, Doctor, very much, indeed.

Dr. Zinn, I would like to put one question to you if you would not mind.

#### STATEMENT OF DR. WALTER H. ZINN—Resumed

The CHAIRMAN. Doctor, I am going to ask you this question based upon what I understand to have been the conversation between Mr. Borden and yourself. In talking about error, the difficulties of com-

ing to an exact figure in matters of this kind, was it you that told Mr. Borden about the illustration at Fort Knox in Kentucky of \$20,000,000 error on gold that is buried there?

Dr. ZINN. I have heard the story, and I have repeated it. Whether or not I repeated it to Mr. Borden, I am not sure.

The CHAIRMAN. You must have, because he told it to me.

Dr. ZINN. It is a well-known story. That is the monetary number the number which expresses how many dollars presumably can be written down to the cent, but actually if you weight up all the gold there and take your errors of weighing, I believe it turns out that your error is something like \$20,000,000 because you do not know how much gold is there, to that amount, just because of the errors in weighing. That is the difference between accounting, where you give to a thing a value which is permanent. For instance, a 25-cent piece is a 25-cent piece, no matter how much it is worn, until its is discarded. Whereas, in this material, of course, every time you handle it you change its value.

The CHAIRMAN. You are talking about uranium now?

Dr. ZINN. Yes. Handling uranium. Everytime you handle it you make a change in the amount that you have there. Usually, it goes down, because you lose some.

The CHAIRMAN. And you change it into gases and liquids?

Dr. ZINN. Yes.

The CHAIRMAN. And bring it back to solids.

Dr. ZINN. Yes; it is inevitable that you have losses along the way so that your inventory cannot be a number which stays fixed. It has to be changed, and can only be accurately changed if you do a lot of analytical work, but even then the answer has always got an error on it, because it is not a 25-cent piece that has that value regardless of what happens to it. There is a difference between monetary accounting and accounting of these materials, a very, very real one.

The CHAIRMAN. And yet, in accounting for the \$20,000,000 you say there can be an error of at least of one-tenth of 1 percent due to the weighing?

Dr. ZINN. Yes; it is a weighing error, and balances are only so good.

Senator HICKENLOOPER. The calculation methods, however, Doctor, used to calculate these enriched and highly important atomic matters are much more delicate—atomic materials are much more delicate than the weighing arrangements for weighing big blocks of gold, are they not?

Dr. ZINN. Well, I do not imagine that where we have to weigh, let us say, several kilograms of uranium, we have any better balances than the Bureau of Standards supplies to the—

Senator HICKENLOOPER. I am not talking about several kilograms; I am talking about grams and less. Measurements are much more accurate.

Dr. ZINN. The relative error is not too much affected by the weight that you are weighing; that is, if you are weighing a milligram you have a certain error, if you are weighing a gram you have a certain error. The percentage error is not—it is true when you get to micrograms, the error goes up, and in miligrams it goes up. The balances are best where it is around a fraction of a gram.

The CHAIRMAN. Now, Senator, do you desire any other witnesses called in relation to Chicago?

Senator HICKENLOOPER. Not any more this afternoon.

The CHAIRMAN. Has any other member of the committee anything to add?

Mr. Price, you stated at 10 minutes of 1 that you had a matter that you wanted to go into.

Mr. PRICE. Yes; I would like to go into a matter which I think justifies looking into, which involves security, and I think it is something we should look into, with respect to the motive behind the different articles that have appeared in the public press, and I think that, perhaps, Mr. Lilienthal might be able to answer a few of the questions that I would like to ask in connection with the articles.

The CHAIRMAN. All right.

Mr. Lilienthal, Mr. Price has some questions which he wishes to address to you.

Mr. PRICE. Mr. Chairman, I have been very much disturbed by what appears to me to be a concerted campaign in some quarters, in other words, deliberate sniping at the Commission which, in my opinion, has a purpose to possibly destroy public confidence in an organization, an organization which is so valuable to our national security.

I have thought for some time that it might be well or advisable for the committee to go pretty thoroughly into this matter and to try to uncover the source of some of this information.

As a member of the committee, I insist that the joint committee go into the matter of leaks in classified information. It is a matter vital to the security of this Nation.

Now, I would just like to refer this afternoon to one or two articles, particularly the article which appeared in the Nation's Business, a publication of the United States Chamber of Commerce, in June 1949, written by Mr. William Bradford Huie. It is entitled "Is the A-Bomb Secure?"

Before going into that article, I would like to refer to an article which the same writer—

Mr. LILIENTHAL. What is the name again?

Mr. PRICE. It is the article which appeared in the June 1949 issue.

Mr. LILIENTHAL. The author's name?

Mr. PRICE. William Bradford Huie.

**STATEMENT OF DAVID E. LILIENTHAL, CHAIRMAN, ACCOMPANIED BY CARROLL L. WILSON, GENERAL MANAGER, AND JOSEPH VOLPE, JR., GENERAL COUNSEL, ALL OF THE UNITED STATES ATOMIC ENERGY COMMISSION**

Mr. PRICE. Mr. Chairman, in the January 1949 issue of the Reader's Digest, this same writer said, in effect—not in effect—he actually wrote this in his article:

Whether or not we can knock out Russia depends on the answer to two questions: Do we now possess the necessary quantity of sufficiently powerful atomic bombs; and (2) can they be delivered to the source of Soviet power?

He writes:

The answer to both questions is "Yes."

Then, he goes on to elaborate on the bomb-manufacturing program, and he states:

On the Los Alamos mesa thousands of technicians have been engaged in nothing but the production of weapons. Does anyone imagine that in the 3 years since Hiroshima, all these mountains have labored to produce mice? Anyone familiar with American zeal and ingenuity cannot escape these conclusions, that we have atomic weapons in quantity; that we have not one but several types of weapons, and that the 1949 model bomb is at least several times as destructive as the 1945 bomb.

Then, going on further, he is talking about people who attempt to deflate the value of the bomb, and he makes this statement:

They would be wiser to heed David Lillienthal when he declares "Some people are beginning to say this man-made earthquake is not so bad after all. Believe me, it is."

Now, my purpose in reading those paragraphs from Mr. Huie's story is to show that 2 months ago he, in effect, was very complimentary of the Commission and also of Mr. Lillienthal.

Now, within 2 months time, he writes another article for *Nation's Business*, which is almost a reversal of technique.

I was just wondering what the motive behind the change is; what are the circumstances behind the change; because I cannot very well delve into the man's mind, but he does point out that if he has the same source of information now as he had 2 months ago, the sources of information have changed their way of looking at the picture, or he may have different sources of information, but I would like to read a few paragraphs from his latest article, "Is the A-Bomb Secure," which appeared in *Nation's Business*.

It says:

The five-man Atomic Energy Commission of which David E. Lillienthal is the Chairman is the most powerful bureau ever created by the United States. Lillienthal accepted the chairmanship on the condition that a majority of the Commissioners should be acceptable to him. Since January 1, 1947, he has been virtually absolute dictator of an organization which is protected by self-regulated secrecy which now spends \$1,000,000,000 a year, and upon which the survival of what freedom is left in the world may depend.

Would you care to comment on that, Mr. Lillienthal, whether you made any conditions at the time that you accepted the President's appointment to this chairmanship?

Mr. LILLIENTHAL. I certainly would like to comment. This statement is a complete 100 percent falsehood. No President would permit such a condition, and no self-respecting man would exact such a condition, and no such condition was suggested, nor did it in fact exist.

Mr. PRICE. Has this article in the June issue of the *Nation's Business* ever been brought to your attention, to the attention of the Commission?

Mr. LILLIENTHAL. It is my understanding it was not submitted for clearance as to the inclusion of restricted data. I did not hear of it—I heard of it several days ago, and read it on the way up to the hearings this afternoon rather hurriedly.

Mr. PRICE. Have you had an opportunity to read it then?

Mr. LILLIENTHAL. I read it hurriedly this noon, yes, I have.

Mr. PRICE. Just going over it hurriedly, what is your opinion of this article?

Mr. LILIENTHAL. Well, I think the most relevant question is, the most important question is, whether the article contains data restricted by law, and this will take some study.

Mr. PRICE. But the article was never cleared with the Commission?

Mr. LILIENTHAL. It is my understanding it was not submitted for clearance.

Mr. PRICE. What is the usual process among writers who write articles dealing with this highly important subject of atomic energy.

Mr. LILIENTHAL. The usual practice among the more careful writers, where any question occurs to them that there may be a question of the use of restrictive data, is to make use of a voluntary service, not one required, but a voluntary service available to them, for counsel from the Classification Division of the Commission as to whether the article contains material which may or may not contain restricted data.

The Commission does not require this, nor indeed, I think, does the law provide that articles be submitted, but it is generally a practice that they are submitted.

Mr. PRICE. This article has not been submitted in advance for publication?

Mr. LILIENTHAL. I believe it was not. I can tell you more definitely later.

Mr. PRICE. Now, I will read another paragraph from this article. In reading this article thoroughly the conclusions in it, to me, seem to be drawn exclusively on the fact that the joint committee dismissed two aides described in the article as intelligence agents. This article states:

Accordingly, Senator Hickenlooper employed as executive director and deputy director of the committee two intelligence agents, Fred Rhodes, Jr., and David S. Teeple. Both of these men had been with Lt. Gen. Leslie R. Groves in the Manhattan Project from the beginning, both of them knew the production and security problems.

Mr. LILIENTHAL. In the Manhattan District employ.

Mr. PRICE. This would infer, this article, reading it here would infer that they did then, and do now——

Mr. LILIENTHAL. No. These two individuals, Mr. Rhodes and Mr. Teeple, were security officers in the Manhattan District, rather than production employees.

Mr. PRICE. Did they know the extent of production?

Mr. LILIENTHAL. I do not know. I would be inclined to doubt it because the Manhattan District general rule was that an individual had only that information which he required for his work, but I cannot be sure about that.

Mr. PRICE. Did they know under the present Commission?

Mr. LILIENTHAL. That is so say while they were employed——

Mr. PRICE. By the joint committee?

Mr. LILIENTHAL. Director and deputy director. No; they did not have that information. That is information as to stock-pile numbers and production and production rates. This information was never supplied at the committee's request to the committee members, and, therefore, was not made available to the staff of the committee.

Mr. HOLIFIELD. Will my friend yield for a question?

Mr. PRICE. Yes.

•**Mr. HOLIFIELD.** You pointed out two statements in this article in Nation's Business, which are direct falsehoods. Would you be free to say that there are other additional falsehoods in that article, or misstatements of fact?

**Mr. LILIENTHAL.** Misstatements of fact. I believe the second statement is inaccurate; the first I do not hesitate to say is a falsehood as emphatically as I can.

The article is being studied from the point of view of a security breach. Until that study has been made, I would prefer to await that study, and at that time, perhaps, the joint committee had better hear further on it in executive session.

**Mr. PRICE.** Do you know Mr. Huie?

**Mr. LILIENTHAL.** No; I do not.

**Mr. PRICE.** I think it is common knowledge, at least in the newspaper fraternity here in Washington, that Mr. Huie was at one time a ghost writer for some men in pretty high and important positions.

The Readers' Digest describes him in the following language:

The Readers' Digest commissioned William Bradford Huie to present the facts. Mr. Huie, well known for his studies on air power, has for years been the close confidante of several of the ablest United States generals.

I would like to point out here, and I am not making any inference or any charges in connection with this, but I would like to point out that an article inserted in the Congressional Record very recently by one of our colleagues on this committee, referred to Mr. Huie as a ghost writer for Lt. Gen. Hugh Knerr, Inspector General of the United States Air Force. I would like to also point out, without making any charges or inference, that Mr. David S. Teeple, mentioned in Mr. Huie's article, a former aide to this Committee, is employed in the Inspector General's office in the Air Force.

**Senator KNOWLAND.** Mr. Chairman, I would like to ask our colleague down the table a question in regard to this article which I have not read. Is his point that there has been a security violation, or is he suggesting that we should set up some kind of a censorship, which I question very highly?

**Mr. PRICE.** Senator, I would say this: I personally feel that there is a security violation in this article. I feel that there is a concerted effort, and I am not making any charges against any individuals, but in different manners there is an effort, a tendency, to discredit this Commission in the eyes of the public. I think that the difference in views as expressed in this one article in January 1949 and another article just 2 months later by the same writer indicates that there are some forces at work. I do not know what they are, who they are, or what their motives might be, but I merely am trying to point out here that this committee should give some consideration to this, and possibly go very deeply into exploring the sources of information of the type that is contained in this article in the June 1949 issue of Nation's Business.

**Senator HICKENLOOPER.** Mr. Chairman, if I may interrupt at this time—

The CHAIRMAN. Senator Hickenlooper.

**Senator HICKENLOOPER** (continuing). I do not want to interrupt the gentleman's discussion of the article, but I will say that his insinuating remarks about Mr. Teeple are inexcusable, and there is no basis for them.

I may call attention to the fact that Mr. Joe Volpe, who sits here, and is General Counsel to the Commission, was one of General Groves' trusted assistants during the Manhattan District, and nobody has raised any question about Mr. Volpe nor made any insinuations about him, and that Mr. Rhodes and Mr. Teeple and Mr. Volpe were all closely associated in the Manhattan District under General Groves; and I resent the veiled insinuation about Mr. Teeple and Mr. Rhodes that certain columnists have been making, and that has now been made in this committee.

Mr. PRICE. I say to the Senator that I did not insinuate that. I was very careful to point out that I was not going to insinuate that.

Senator HICKENLOOPER. I can get the implications of your statement.

Mr. PRICE. I merely pointed out that there has been some violation of security furnished to a writer, and he must have had some source of information, and I think that it is vital in the interests of national security that this committee explore such leaks. I am not placing the blame on anybody for the leaks, but I think it is a very important matter, and I think this committee should give some consideration to exploring the sources of these leaks.

If you talk about national security, this is some place where we should begin to make some explorations.

Senator HICKENLOOPER. I am raising no objection nor interfering with the gentleman's examination of the article. I only spoke up as to the individuals who were carefully brought in.

Mr. PRICE. I am not insinuating. The only reason the names came in here were because they are named in this article. If they had not been named in this article, I would not have even mentioned them, because I had no idea along that line before I read this article or even since I have read it. But there has been some leak in classified information that this committee should delve into, and I brought this up because with a hearing here this morning in reference to the Argonne Laboratory matters, there was a very serious leak there, and this committee should do something about plugging up those types of leaks if they are going to preserve the security of this project that it necessarily must have.

Senator KNOWLAND. Mr. Chairman?

The CHAIRMAN. Senator Knowland.

Senator KNOWLAND. Mr. Chairman, there are a couple of questions I would like to ask Mr. Lilienthal or Mr. Wilson, whoever might be the best one to answer the questions.

Mr. LILIENTHAL. Mr. Chairman, may I complete the statement in respect to this article before going on?

Senator KNOWLAND. Yes.

Mr. LILIENTHAL. The question was asked about misstatements of fact and falsehoods.

Without trying to cover all of them, there is one that I do recall and would like to make a point of at this time before we leave the subject.

Mr. PRICE. Perhaps you are going to touch on one that I might want to bring out.

Mr. LILIENTHAL. The statement, as I recall the reading of the article this noon, is made and elaborated, that your witness, as Chairman of this Commission, has a false idea of the proper emphasis put upon

production of weapons; that that emphasis is upon peacetime uses of atomic energy, and that the Chairman of the Commission does not have the stomach to press forward and put the proper emphasis on the admittedly grim business of producing atomic weapons for this country.

I do not think it is necessary for me to say more than that it is not only a falsehood, and in considering my oath of office, a reflection on my patriotism, as well as my stomach, of which I think I have the normal quota of each, but is completely contrary to the record of the Commission on which I sit in the past 2½ years.

I would like to make the further comment that these articles contain statements in respect to two of, perhaps, the most highly classified and important pieces of information from the point of view of a potential enemy of this country: These two items, these two statements, relate, one, to the destructiveness of the present atomic weapons as tested at Eniwetok, and now in production.

The importance of information on the subject to a potential enemy is too obvious to require any further comment.

A second statement in these articles of that same character relates to the number of weapons, an inference as to the number of weapons in our stock pile, and the number of weapons that, by a curious distorted and fantastic kind of statement, the number of weapons that should be in the stock pile—

Mr. HOLIFIELD. And the number per year.

Mr. LILIENTHAL. Mr. Price's comment about the wisdom of inquiring into such statements as these would seem to be obvious on this basis. I am not speaking now about the course of the committee, but of the course of the Commission.

As I say, these will be examined more carefully, and a report in executive session made back to the committee.

The CHAIRMAN. Senator Knowland?

Senator HICKENLOOPER. May I just comment on this matter? Mr. Lilienthal referred to—I may say that for the first time I have read this article today during this meeting. I heard of the article and intended to get a copy of the magazine, but I did not have a copy of it, and I borrowed a copy of it today from the staff.

I have been busy on some other things, and I forgot to get the article, but here I believe is a paragraph referred to with respect to some complaint, that Mr. Lilienthal has not paid any attention to making weapons, and I would like to comment on it because I think it is only fair to comment. The paragraph says:

But, instead, the manufacture of bombs seems to have been treated as a secondary rather distasteful activity of the AEC. From the lecture platform repeatedly, almost apologetically, Lilienthal has declared, "If all there was to atomic energy was weapons, I would not be in this job." In his confidential appearances before the congressional committee he has been impatient with questions about bombmaking, and has hastened to his long-range plans—

and so on, with atomic energy.

I must say in all fairness that I know of no time that Mr. Lilienthal has been restless or impatient with questions about bombmaking. I could not at all agree with that statement in the article.

But with respect to whether Mr. Lilienthal has said on the platform "If all there was to atomic energy was weapons, I would not be in this job," I cannot verify whether he has made those statements on the

platform or not. I presume that I could check through copies of speeches, which have come over, but I have no knowledge. Mr. Lilienthal could say whether he has ever used that language or not.

Mr. LILIENTHAL. I am glad of an opportunity to say that I have not used that language or anything that bears the same connotation.

Senator HICKENLOOPER. But I would certainly on that particular score want to say that I know of no occasion when Mr. Lilienthal has been impatient with questions about bombmaking. That is a direct quotation from this article.

Mr. HOLIFIELD. Mr. Chairman?

The CHAIRMAN. Mr. Holifield?

Mr. HOLIFIELD. As long as this article has been brought into question, I would like to have Mr. Lilienthal's comment on the following paragraph:

Lilienthal and the military have argued for 2 years over custody of the atomic bombs.

Now, that is news to me. As a member of the committee, that is news to me that you and the military have been arguing over the custody of the bomb. I thought that the Atomic Energy Act provided for that, and that it was a fait accompli, and it is not something for argument between yourself and the military.

Has there been an argument between yourself, the Commission, and the military on the custody of these bombs?

Mr. LILIENTHAL. There have been discussions raised by the military as to the custody of the weapons, which are in the hands of the Atomic Energy Commission.

The President stated publicly last July 24 that he had heard these discussions, he being the individual who could change the status quo, and decided, for reasons included in his public statement and in other statements which were not public, to leave the custody with the Atomic Energy Commission under arrangements with the military, the nature of which, I believe, has been described to the joint committee.

The word "argument," I think, goes a little further than what these were, but these were expressions, these were explorations of positions urged upon us, urged upon the President, by members of the Military Establishment.

Mr. HOLIFIELD. Your position has been, and following out the President's order, to maintain the custody of the bomb in civilian hands as was directed in the act; has it not?

Mr. LILIENTHAL. When the Manhattan District was transferred to the Atomic Energy Commission on the first of January 1947, the President's Executive order included custody of the atomic weapons. The President, as Commander in Chief, and as President, could at that time have made another disposition of it.

The suggestions from the Military Establishment were that the President should change that custody. He concluded for a number of reasons within his purview as Commander in Chief and Chief Magistrate not to do so, and since that time I have assumed, and I believe I am correct in assuming, that the decision has been accepted by the Military Establishment and all of its individuals, both in their official and their private capacity.

Mr. HOLIFIELD. Well, I am glad to hear that because this writer goes on and says, "Why should not the Air Force take custody? How can an adequate Air Force personnel be trained to assemble and detonate the bomb if the Air Force has no bomb?"

If there is a renewal of the attempt on the part of some trigger-happy admirals and generals to take over the bomb, both as to production and custody, I think the American people ought to know it.

The CHAIRMAN. Well, Mr. Holifield, the Secretary of Defense, Mr. Johnson, who is an honorable man, has assured me in a letter that the official view of the National Military Establishment is that he is quite satisfied with the present arrangement. He specifically endorsed in that letter the approval that was evidenced by Secretary Forrestal shortly before he died, in his last report to Congress.

I merely say that for the record because the Secretary of Defense cannot, of course, control the thinking of every last individual down to the last private and corporal, but I am pleased that that is the official policy of the Department of National Defense, which, of course, is in consonance and harmony with the determination, and a very wise determination, in my opinion, which was made by the President of the United States when he decided this issue.

Mr. LILIENTHAL. May I add, while we are on that, so that there will be no misunderstanding, I have seen organizations for quite a long time, and a good many in Government, and I may say that, without exception, the working relations between the Atomic Energy Commission and those for whom we are responsible, and the men in the Military Establishment, are as good and as wholesome and wholehearted as I have ever seen in any phase of public service anywhere.

This is not to say that there do not occasionally arise differences of opinion, but they are carried on with the dignity and an adherence to the facts, and the fairness which especially in the last year and a half when our organizational liaison has improved, that I think it would be hard to improve on.

Now, this happens to be very important. Whether it relates to custody or anything else, it is very important because it is the spirit and atmosphere that exists between two organizations which have common interest, but different sources of responsibility, that I think has a lot to do with the present security of the country insofar as it relates to this weapon.

Mr. HOLIFIELD. Can you assure us, Mr. Lilienthal, as Chairman of the Commission, that, notwithstanding the fact that the Commission is in technical custody of the bombs, they are available instantly without undue delay of any type to the military in case there is need for them to take the bomb and deliver it?

Mr. LILIENTHAL. I can.

Mr. HOLIFIELD. That there is no cumbersome method involved in making them available, and upon order of the President?

Mr. LILIENTHAL. The procedure——

Mr. HOLIFIELD. Never mind the procedure. I do not want to bring in procedure. I want an answer to the question. Can they be made available without undue delay to the military?

Mr. LILIENTHAL. They can, and I just would like to say that my hesitation was to frame this sentence, that why they can and how they can have been described in detail to the joint committee.

Mr. HOLIFIELD. That is right.

Mr. LILIENTHAL. The important thing now is to say——

Mr. HOLIFIELD. That is a matter that I do not want to bring out, naturally.

Mr. LILIENTHAL (continuing). Unequivocally they can.

Mr. HOLIFIELD. This sort of sneak attack, then, is something that is conveying to the American people exactly the wrong impression.

Mr. PRICE. Mr. Chairman, I would just like to ask one more question about this article, and then I am through.

Speaking of the relationship between the joint committee and the Commission, they have a paragraph in this story which says:

The result has been little more than a continuing series of disputes over matters which involve the national safety. One of these disputes has been about the question of production.

Do you recall any of these disputes, when they might have occurred and what they were?

Mr. LILIENTHAL. No. Such a statement as that is reckless and irresponsible, considering how grave the subject is that we are dealing with.

May I say and add, Mr. Price, to the previous question, about the possible security breaches, that with respect to this piece we are consulting at the earliest possible date with the Director of the Federal Bureau of Investigation, Mr. Hoover, as part of an inquiry into the possible security breaches involved in these pieces.

Mr. PRICE. Mr. Chairman, I would like to say that I regard this article as a collection of distorted statements, misrepresentation, of lies, and I think it was done for the purpose of discrediting this Commission.

The CHAIRMAN. Now, Senator Knowland?

Senator KNOWLAND. Mr. Chairman, I would like to ask Mr. Wilson a question.

As the General Manager, you, perhaps, would be the best one to supply the facts: How many cases do you have, Mr. Wilson, of people working either for the Commission or the contractors, to your knowledge, who have given substantial false testimony on their original applications for employment?

Mr. WILSON. Where such information comes to our attention disciplinary action is taken in relation to people who may then be employed. Disciplinary action, if this is other than an accidental omission, is one of dismissal.

In the case of applicants, when this comes to our attention they are not employed.

Senator KNOWLAND. Where it is discovered, if they are employed, they are dismissed?

Mr. WILSON. That is correct.

Senator KNOWLAND. And that has taken place in each case that has come to the attention of the Commission?

Mr. WILSON. In each case that I know of, and these are instructions.

Senator KNOWLAND. Now, in regard to the question of disciplinary action—this is a hypothetical case. If you had someone that would deliberately take some material home, is that a situation that would also require dismissal, or what disciplinary action would be taken?

Mr. WILSON. There would be consultation between the employer—let us assume this is a Commission's contractor's employee—as to the

circumstances, as to his intent, as to the character of the infraction or violation of the regulations, depending upon the record of the individual, his performance, the intent involved, the judgment would be made as to whether he should be reprimanded or whether he should be dismissed. This would be a matter of consultation between our local office and the employer.

Senator KNOWLAND. Could you tell the committee the number of visiting newspapermen, columnists, and radio commentators to whom you have extended courtesies to the various plants of the Commission, say, Oak Ridge, Hanford, Argonne National Laboratory, and Los Alamos?

Mr. WILSON. You mean for visits to unclassified areas?

Senator KNOWLAND. Well, could you just explain? Have there been numbers of them? I am not critical of it, because I can see very many advantages of doing it.

Mr. WILSON. I can furnish that, Senator; I do not know offhand. There have been a number of members of the press and radio who have visited parts of Argonne Laboratory, who visited Los Alamos, who visited Oak Ridge. These are towns, as you know; they are not admitted to the exclusion areas; they are not admitted to any place where clearance is required.

Senator KNOWLAND. Are they entirely limited to visiting the town sites?

Mr. WILSON. Not where there is unclassified area in certain laboratories. Let us take Brookhaven, for example. Most of the work there is unclassified, and all of the classified work is in what we call exclusion areas, admittance to which is limited to those people who have clearance. Now, they would obviously not go in such places.

Senator KNOWLAND. All right.

The CHAIRMAN. Senator, you have nothing further to take up at this time?

Senator HICKENLOOPER. No; I do not anticipate going further into this matter.

The CHAIRMAN. I think that we have had a long hearing today, and as I understand it, you wish to go forward at 10:30 tomorrow morning?

Senator HICKENLOOPER. Yes.

The CHAIRMAN. At 10:30 tomorrow morning.

Mr. LILIENTHAL. Can we know the subject?

The CHAIRMAN. Senator Hickenlooper states that he will send word to the staff of the committee, which will transmit it to the Commission, as to what the subject will be, and he will do it in very short time.

Mr. LILIENTHAL. If this involves people out of town, it will be a very great help.

The CHAIRMAN. Thank you very much.

(Whereupon, at 4:10 p. m., an adjournment was taken until 10:30 a. m., Friday, June 17, 1949.)

# INVESTIGATION INTO THE UNITED STATES ATOMIC ENERGY PROJECT

---

FRIDAY, JUNE 17, 1949

CONGRESS OF THE UNITED STATES,  
JOINT COMMITTEE ON ATOMIC ENERGY,  
*Washington, D. C.*

The joint committee met, pursuant to adjournment, at 11:35 a. m., in the Caucus Room, Senate Office Building, Washington, D. C., Senator Brien McMahon (chairman) presiding.

Present: Senators McMahon (chairman), Connally, Vandenberg, Millikin, and Hickenlooper; Representatives Holifield, Price, Cole, Elston, Hinshaw, and Van Zandt.

Also present: David E. Lilienthal, Chairman; Sumner T. Pike, Commissioner; Lewis L. Strauss, Commissioner; Gordon E. Dean, Commissioner; Henry D. Smyth, Commissioner; Carroll L. Wilson, General Manager; Carleton Shugg, Deputy General Manager; Frances Henderson, Assistant to the Chairman; Walter J. Williams, Director, Division of Production; Brig. Gen. James McCormack, Jr., Director, and Capt. James Dussell, USN, Deputy Director, Division of Military Application; Joseph Volpe, Jr., General Counsel; Bennett Boskey, William Denson, and Everett L. Hollis, Office of General Counsel; Edward Brosnan, Division of Security; Morris Salisbury, Director, Shelby Thompson, and Dodney L. Southwick, Division of Public and Technical Information Service, all of the United States Atomic Energy Commission.

The CHAIRMAN. The meeting will come to order.

I believe that Senator Hickenlooper is ready to proceed with the matter of the construction of the natural gas pipe line at Oak Ridge.

Senator HICKENLOOPER. Mr. Chairman, I want to present to the committee this morning again a matter which has been considered by the committee, in connection with the administrative and financial activities in the Atomic Energy Commission. I want to refer to the so-called natural gas pipe line construction at Oak Ridge, Tenn.

The original proposal, as I understand it, was to construct 117 miles of 16-inch pipe, 20 miles of 6½-inch pipe, and 18 miles of 8¾-inch gas pipe line to supply natural gas to the installations at Oak Ridge, Tenn. This matter came to the attention of the joint committee some time ago.

There was some question raised as to the need for this natural gas pipe line, and you, Mr. Chairman, appointed a subcommittee to look into this matter. That subcommittee consisted of Mr. Durham, Mr. Price, Mr. Cole, and Mr. Van Zandt. The subcommittee made an investigation.

On May 23 of this year it filed a report in which it canvassed the situation, and canvassed the adequacy of the coal supply in Oak Ridge

to furnish fuel for the existing facilities, and finally came to these conclusions:

(a) Adequate coal stock piling appears to be feasible at Oak Ridge to insure continuous power-plant operation.

(b) Reliance on fuel sources outside of the local area does not appear compatible with the original selection of the Oak Ridge site or in the best interests of the common defense and security.

(c) The Commission's action has been taken without consultation with the National Security Resources Board.

(d) Substantial improvement in the national fuel picture in the past 18 months has not been reflected in the Commission's action.

Then the subcommittee made a recommendation as follows:

The joint committee should make legislative provision requiring express authorization of Commission proposals and programs having major economic security or production importance prior to Commission actions.

Mr. Chairman, this report is not long and I will not attempt to read it into the record now. The Commission has it; the joint committee has met and received this report; adopted, I believe, unanimously the report that was unanimously adopted by the subcommittee originally. The report contains criticism of the Commission's action in building what I interpret from the report to be a \$10,000,000 installation which is not needed either for national security or for the purpose of furnishing fuel supplies to the Oak Ridge plant.

The Commission was notified of the unanimous action of the joint committee in approving this report, and of the opinion of the joint committee. I will quote certain paragraphs from an Associated Press article taken from the Washington Evening Star of June 2, 1949. It is headed "Knoxville, Tenn., June 2." It states:

A Nashville contractor planned to move equipment today to start work on a 172-mile natural gas pipe line to Oak Ridge atomic plants although a congressional committee only last week disapproved the project.

It is my information that the Commission nevertheless has gone ahead with this project in the face of the unanimous finding of this joint committee that the project is unnecessary. It is a \$10,000,000 expenditure that in my opinion is needless, is wasteful, and has no present or reasonably anticipated use in the near future.

I submit that, Mr. Chairman, for whatever discussion you think would be proper, with the Commission, on that score.

(The balance of the article is as follows:)

The multimillion dollar pipe line contract was awarded last night to the Oman Construction Co. of Nashville.

Wade Thompson, president of the East Tennessee Natural Gas Co., announced the contract award here. He said Ebisco (sic) Services, Inc., of New York, will handle engineering problems and supervise the pipe-line construction.

Senator McMahon, Democrat, of Connecticut, said last Friday the congressional Atomic Energy Committee which he heads had turned thumbs down on the pipe line. He said a subcommittee reported "adequate" coal stocks are available for Oak Ridge atomic plant fuels and that the gas line, to cost an estimated \$10,000,000 is not necessary.

Mr. Thompson said "We've got a contract with the Atomic Energy Commission to supply Oak Ridge AEC operation with 60,000,000 cubic feet of gas daily for 20 years, and they can't stop us."

He said his company has paid for 25,500 tons of pipe steel certified to it by the Commerce Department, and that the Federal Power Commission gave its approval in certifying the project.

The CHAIRMAN. Who will be designated to answer for the Commission?

Mr. LILIENTHAL. Commissioner Pike and Production Manager Williams will respond.

The CHAIRMAN. All right, gentlemen, will you step forward, please?

Commissioner, this is your debut, is it not?

Mr. PIKE. It seems so, somewhat delayed, but——

The CHAIRMAN. You are not complaining?

Mr. PIKE. I am not complaining, not at all.

**STATEMENTS OF SUMNER T. PIKE, COMMISSIONER, AND WALTER J. WILLIAMS, DIRECTOR, DIVISION OF PRODUCTION, UNITED STATES ATOMIC ENERGY COMMISSION**

Mr. PIKE. One of the first things that bothered us when we got a survey of this whole show was the necessity for continuous operation of the gaseous diffusion plant at Oak Ridge for reasons with which you are thoroughly familiar, and which need not be gone over here. There is no disagreement on that point.

The history of coal supplies in previous periods of operation have been pretty troublesome. There apparently had been an attempt to keep up a large stock pile of coal. There was a period when, in spite of the best efforts of the Manhattan District, the coal pile had dropped by nearly 100,000 tons. This was partly due to irregularity of production of coal, partly due to unavailability of freight cars to get coal to the project.

At times the coal situation seems pretty good. At other times the coal situation seems pretty bad. At the moment it is a mixture of the two: The coal mines are shut down, but there is still a lot of coal around. This is typical of the coal business. It is a highly disorganized industry in production.

There are about 16,000 mines in the country, most of them small. On the labor end, it is quite well organized. Whether they want to call strikes or not, work stoppages have been quite frequent in the coal industry.

Personally, I always feel pretty doubtful that that is the sort of thing that one should depend on wholly, when he has a good alternative.

After making a survey, it seemed to us that there was an opportunity to get a completely independent supply of fuel at no over-all cost to the Government except the minor cost of changing the burners in the boilers, and at a substantial saving, which at that time looked like around \$600,000 a year. At the present prices of coal and at the present prices of gas on the contract, the annual saving will be \$1,250,000 a year by the use of gas as a fuel.

Of course, nobody can see very far ahead on prices of fuel as far as coal and oil are concerned. It is almost impossible to get a contract running beyond a few months. In the case of gas, it is possible. In this case, I think the cost of the line is around \$10,000,000.

The line would not have been put in unless there was a willing user on the receiving end. We are the willing user of gas. We have, in effect, told them that we will use gas at this price for a period, and if we don't use it, we pay some damages. This is a perfectly typical commercial contract.

If, however, we do as we expect—use the gas—no cost of this pipe line will fall on the Government whatsoever. It looks to me as if we have got about what we want: a completely independent source of fuel, independent both as to the fuel itself and its method of transportation. It is a good fuel. It comes at a price which is a saving to the Government of a million and a quarter dollars a year, an item not to be ignored. It still leaves us coal as a stand-by fuel.

Due to the physical nature of the two fuels, coal can be piled and used in case of a stoppage. Due to the nature of gas, it cannot be stock-piled and used in case of emergency. If you have the two fuels good management dictates, first using the one that costs less and using the one that is not a good emergency reserve. Both happen to be the gas. Then, for the reserve use the one that is more costly and the one that can be stock-piled. That is coal.

I think that is about the length and breadth of our position. I must say I disagree with the report of the subcommittee. Some of the observations are not particularly relevant. Some of them do not carry much, if any, weight. In this case, I respectfully submit that it is human to err, and I think the committee came to the wrong conclusion. I think that to adopt the report of the committee would involve a waste of Government funds of substantial size.

Now, I rather respectfully hope that you will look this situation over again and change your views.

Senator HICKENLOOPER. Had you finished?

Mr. PIKE. Yes.

Senator HICKENLOOPER. Mr. Chairman?

The CHAIRMAN. Senator Hickenlooper?

Senator HICKENLOOPER. Mr. Pike, the subcommittee states in its findings as follows, and I am reading from page 6 in the third paragraph from the bottom under the heading "Coal":

The worst experience recounted—

That is, the worst experience of the Commission—

was a reduction in the coal inflow between August 1946 and August 1947, which resulted in drawing down the 200,000-ton stock pile to 92,000 tons, or 6 weeks' requirements. At this lowest point in the experience of the Commission, the coal supplies were still arriving to cover up to 80 percent of the daily requirements.

So that the lowest possible point, according to this report, that the Commission has ever experienced in the supply of coal still left them 6 weeks' reserve, and still enabled them to get in during that so-called emergency period enough coal daily for 80 percent of the total requirements.

Now, is that substantially correct?

Mr. PIKE. I think it is, Senator, but I suggest Mr. Williams, who knows the facts more directly, can give you a better answer to that question.

Senator HICKENLOOPER. The Commission is prepared to make an outlay on this gas line, in one way or another, whether it is reflected in the price of the gas or otherwise, an amount approximating \$10,000,000; is that not true?

Mr. PIKE. I do not think that is right, Senator. My memory—and, of course, the contract is available—my memory is that if we buy the gas as we expect to buy, there is no question of a penalty. The fact is

that these people put in 180 miles of pipe line. They have a big customer, which is the Atomic Energy Commission, on the end of it. They wanted some assurance that the pipe line would be justified, and that they would make some money on it, as I hope they do.

Senator HICKENLOOPER. The subcommittee report states on page 6 as follows:

The Commission has pledged an initial amount of \$4,400,000 for natural-gas payments.

That is an initial advance payment toward gas purchases, is it not?

Mr. PIKE. No, sir; it is not an advance payment. It merely says that we will buy a certain amount of gas each year, and this is a forfeit if we do not buy.

Senator HICKENLOOPER. I see. The gross cost of the pipe line has been estimated by the gas company at \$9,329,900.

Mr. PIKE. I think that is right.

Senator HICKENLOOPER. Now, the people putting the gas line in have to get that money back somehow, do they not?

Mr. PIKE. Yes, sir.

Senator HICKENLOOPER. And it comes out of the Commission in one way or another?

Mr. PIKE. Yes; I think that is right.

Senator HICKENLOOPER. That is the point.

Mr. PIKE. And still get a cheaper fuel than the fuel we are buying.

Senator HICKENLOOPER. Mr. Pike, it is contemplated that eventually the houses in Oak Ridge will be heated by gas, is it not?

Mr. PIKE. That is correct; yes, sir.

Senator HICKENLOOPER. So that this gas installation is not alone for the use of the production facilities, the industrial facilities at Oak Ridge, but it is also contemplated to equip the houses in Oak Ridge with gas-burning furnaces.

Mr. PIKE. Primarily so. The first purpose is to give fuel for the power plant.

Senator HICKENLOOPER. Do you know how much it will cost to convert the houses in Oak Ridge, each house, to a gas-burning furnace?

Mr. PIKE. No, sir; but may I finish my sentence first?

Senator HICKENLOOPER. Yes.

Mr. PIKE. The primary purpose of getting the gas in is for the power plant. The saving which we have estimated, a million to a million and a quarter at present prices, takes in no use or no application of industrial gas. That is a separate thing. I am not too familiar with it.

I think where we have this problem of the community and have to take coal to every house and take the ashes out, I should think the town management would be very anxious to get the fuel which will get in there by itself and leave no ashes. Perhaps Mr. Williams can give you that information.

Senator HICKENLOOPER. At the present time I believe the custom has been to just furnish all the coal that is needed to every house as they request it. There has been no particular—that is included in the rent, is it not?

Mr. PIKE. I think it has been up until recently. I would be very much happier if Mr. Williams, who knows the facts first-hand, could give you that.

Senator HICKENLOOPER. I thought you had been in some general charge of this.

Mr. PIKE. I have been acquainted with it, Senator, but I obviously have not been at Oak Ridge very much.

Senator HICKENLOOPER. I see. Then I do get it that you clearly disagree with the findings of the subcommittee and the joint committee.

Mr. PIKE. Yes; I do, Senator.

The CHAIRMAN. All right, Mr. Williams.

Mr. WILLIAMS. Mr. Chairman, if I may, I would like to make a general statement to clear up some possible misconceptions, to just sort of lay out the problem and then I can answer some questions, I hope.

There have been certain questions that have been raised in connection with the gas line to Oak Ridge, which makes it necessary to review some of the background concerning this project.

When the Manhattan Engineering District was looking for a site for the atomic energy project, it finally decided on the Oak Ridge location, based on the following criteria: The site must have available a continuous supply of water; a medium-sized town should be close, but not too close, since the plants had to be isolated from surrounding heavily populated areas; rail transportation had to be available; roads had to be available; the climate was considered, in order that construction could be carried on throughout the year, since this was an urgent project; a series of ridges and valleys was determined essential, so that the plants could be isolated from one another and from the town by a natural barrier; a supply of electric power was necessary.

There is no record that low-cost coal was a major consideration in the location of the Oak Ridge plant.

Mr. COLE. May we have in the record the source of this criteria which Mr. Williams has used in the determination of the Manhattan District in selecting Oak Ridge?

Mr. WILLIAMS. I believe it is listed in the Manhattan District history, and yesterday in order to check to be sure, I talked with General Nichols, who has been with the project since the beginning. I did not come with the project until 1944. He gave me essentially this information.

Now, I am quite certain, though, that it is in the history of the Manhattan project. I have not read it in there. I got this from General Nichols.

If I may start that sentence again—there is no record that low-cost coal was a major consideration in the location of the Oak Ridge plant; in fact, in the early stages of the selection of the site, it was not known that large electrical generating facilities would be necessary on the site. After preliminary designs and operating requirements had been discussed and plans had been formulated for the gaseous diffusion plant, it was found that an electrical power supply on the site would be necessary, and at this time a decision was made to install coal-fired boilers due to the availability of coal.

The gaseous diffusion plant actually got under construction later than the electromagnetic plant and the X-10 laboratory. A stock pile of coal was built up for the operation of the K-25 steam plant prior to the actual operation of the plant, so that in March 1946, the stock pile was approximately 190,000 tons. A coal-mine strike took

place in March 1946, and affected the delivery of coal to the plant over a period of approximately 60 days, which caused the stock pile to drop to a low of approximately 97,000 tons in May 1946. The stock pile was then built up to approximately 235,000 tons by August 1946.

Mr. COLE. Mr. Chairman, may we have a confirmation in the record of the amount at the lowest point in the stock pile? Which in the report is specified at 92,000.

Mr. WILLIAMS. This is another time. I will get to that, sir.

Mr. COLE. What is the lowest point?

Mr. WILLIAMS. Ninety-two.

Mr. COLE. Ninety-two?

Mr. WILLIAMS. Approximately 92.

Mr. COLE. I think your statement should identify the amount of tons which were present at the lowest point.

Mr. WILLIAMS. I did not get to the lowest point yet, sir. I will get to it in the next sentence.

From August 1946 to August 1947 there was a deficit between coal consumption and coal deliveries, which resulted in reduction of the stock pile to about 92,000 tons. This situation brought forcibly to the attention of the Oak Ridge office the critical situation which could occur if coal deliveries could not be built up.

Now, at the same rate of use as we had experienced over the previous period, if conditions continued to pertain, we would have been out of coal in about 9 weeks and, depending on the approximately 80 percent of requirements which could be delivered.

On August 12, 1947, this information was furnished the Washington office, with the further explanation that the deficiency in replacements was primarily due to the shortage of coal cars, arising from the fact that large shipments of coal for export were requiring the use of many of the cars which otherwise would be available for delivery of coal to Oak Ridge. The Washington office interceded with the Transportation Corps, United States Army, the American Association of Railroads, and the Office of Defense Transportation in an effort to obtain assignment of cars to the Oak Ridge area, for use in delivering coal to Oak Ridge. These efforts were unsuccessful, except to the extent that ODT issued an order providing for the return of coal cars to southern railroads, which counteracted a previous order requiring coal cars to be returned to northern railroads.

On September 11, 1947, TVA was advised of the critical situation of the coal pile at Oak Ridge, and advised that a reduction would be made in power generation on September 18.

We were intending to cut back the power generation and take a slight loss in production, using TVA power if it were available.

At this time TVA was critically short of power, and water storage in three reservoirs had been reduced to a dangerous level. TVA was extremely anxious for us to continue to generate power at the same rate as before. A meeting was held with TVA representatives on September 15, 1947, at which time arrangements were made for each agency to issue coordinated telegrams at 2 p. m. on September 16, 1947, to John R. Steelman, urging that 200 coal cars be assigned for use in supplying coal to Oak Ridge. On September 18, 1947, the Washington office advised Oak Ridge that it had received a reply from Mr. Steelman to the request for the 200 coal cars to the effect, that no cars were

available for such assignment, but authorizing the procurement of coal in an unlimited area. This authority was of little real value, because the shortage of railroad cars rather than the supply of coal was the controlling factor.

Because of the critical situation, Oak Ridge arranged for the procurement of approximately 1,500,000 gallons of fuel oil to augment the fuel stock pile. This action was taken even though the purchase price for the fuel oil was equivalent to purchasing coal at \$17 per ton, and even though fuel oil was in critically short supply at the time.

On September 25, 1947, S. R. Sapirie, Chief of the Operations Division, Oak Ridge, reported that the results of the investigation by Carbide and Carbon Chemicals Corporation regarding the availability of oil for use in operating one or more boilers at the K-25 power plant had disclosed that a firm commitment could not be secured from any major oil companies. The investigation included the following companies; Standard Oil, Gulf Refining, Texas Oil, Shell Petroleum, Pure Oil, Southern Oil Co. of Chattanooga and Ashland Oil & Petroleum Co. of Ashland, Ky. All of the oil companies, with the exception of Ashland, indicated they were oversold and could not make commitments for any additional supplies of fuel oil. Ashland indicated that they could deliver 750,000 gallons per month for September and October, at the unit price of \$0.1031 per gallon, and 500,000 gallons per month after November 1 for the balance of the year. They would make no commitments beyond that time. The Texas Oil Co. representative in Knoxville referred the matter to H. B. Wiley, in charge of their office in New Orleans, who advised that he could make no oil available. The amount of oil required at that time for the operation of one boiler was approximately 3,500,000 gallons per month. At that time the cost of operation of additional boilers on oil was reported to be three times as much as for coal-fired operations.

It should be pointed out here that during the period of August, 1946, to August, 1947, every effort was made to purchase additional coal, but in spite of these efforts approximately 10,000 tons of coal per month had to be taken from the reserve stock pile.

As a result of our experience, the Manager of the Oak Ridge Operations began considering very seriously a dependable alternate supply of fuel for the operation of the K-25 steam plant. On January 6, 1948, the Commission considered recommendations by the Manager of Oak Ridge Operations concerning approval of natural gas as the major fuel at Oak Ridge. The Commission deferred action on this proposal, requiring further staff study and investigation as to the cost of the proposal and as to certain of the proposed contract terms.

At its meeting on January 27, 1948, the Commission again considered this matter, together with supplementary information prepared by the Director of Production. The Commission noted with approval a proposal for the use of natural gas as a fuel at Oak Ridge. The Commission also noted that the Manager of Oak Ridge Operations would proceed with the selection of a contractor and negotiation of a suitable contract if that proved feasible. Following this Commission action, the Oak Ridge office pursued negotiations with a potential supplier. These negotiations culminated in a contract with the East Tennessee Natural Gas Co., which was approved by the General Manager on June 23, 1948.

Senator MILLIKIN. Where is the source of the gas?

Mr. PIKE. The gas comes through the Tennessee Gas Transmission lines, Senator Millikin. It comes from the lower Texas Gulf coast. There is a string of fields down there, most of which produce gas along with oil. The Tennessee Gas Transmission, as you know, is a fairly new company. It has very large supplies of gas, and this is a stub line that comes over and runs 180 miles from that.

Mr. WILLIAMS. The Joint Committee on Atomic Energy has been kept advised of our general plan to bring gas into Oak Ridge, and of our progress. Letters on this matter were addressed to Senator Hickel on February 9, 1948, March 18, 1948, June 23, 1948, and October 5, 1948. The Military Liaison Committee was advised of this matter on June 18, 1948, and concurred in our action by letter dated July 2, 1948.

It is believed that the members of the joint committee are cognizant of the fact that the coal-fired steam power plant at Oak Ridge is essential to the operation of K-25. The Commission gave careful consideration to this matter and decided that a dependable alternate supply of fuel is essential to the national defense and security. The gas line to Oak Ridge has been the subject of many informal discussions and considerations by the Commission and its staff for approximately 18 months.

There are a couple of other bits of information which I believe are pertinent. The supply of natural gas is not being wiped out at the present time. I have here a publication of the Standard Oil Co. of New Jersey, which they label the Lamp, and which comes out monthly. This is for June 1949.

They show that in 1930 there was a production of  $1\frac{1}{2}$  trillion cubic feet of gas and that there were reserves of 46 trillion.

In 1934 there was a production of  $1\frac{1}{2}$  trillion and reserves of 62 trillion.

In 1940 there was a production of  $2\frac{1}{2}$  trillion and reserves of 85 trillion.

In 1945 there was a production of approximately 4 trillion and reserves of 148 trillion.

In 1947 there was a production of  $4\frac{1}{2}$  trillion and reserves of 166 trillion.

This is quoting from a paragraph of this article, which states:

The Nation's proved reserves of natural gas—

that is, the gas already discovered and awaiting production—

rose from 15 trillion cubic feet in 1919 to almost 166 trillion in 1947. Thus, reserves have been increasing at a rate of more than 5 trillion cubic feet a year. The deeper drilling for oil that is now widespread is opening vast reserves of gas, for deeper formations tend to have more gas than oil. Economists estimate that by the end of 1955 we will have proved reserves of perhaps 200 trillion feet, even if consumption continues to rise as in the past few years.

Senator MILLIKIN. Mr. Chairman, may I ask: What are the reserves of this particular source of supply?

Mr. WILLIAMS. We were given to understand in conversation that the reserves were good for 20 years.

Senator MILLIKIN. Did you make any check on that?

Mr. WILLIAMS. We talked with the Federal Power Commission. Mr. Pike, I believe, is somewhat familiar with the reserves in that area, and that is where we got it.

Senator MILLIKIN. Was an expert appraisal of the reserves made on behalf of the Commission?

Mr. PIKE. There was not, Senator. You see, with the expansion of the Tennessee Gas Transmission lines going on now, they will have at the end of next year a capacity of around a billion feet a day. Our use will be about 6 percent of that.

Expert analyses of their reserves have been made for the all-over reserves of gas down there. I am quite familiar with the district, and it is a district where oil and gas are both being found frequently and where you can depend not only on the known reserves, but on the rate of discovery.

Let me give you an example, Senator Millikin. We do not have any question about our oil reserves, or at least at times we do not.

We are using around 2,000,000,000 barrels a year of oil. Yet our known reserves of oil are around 23 to 25 billion, say 11 or 12 years' supply if we keep on discovering every year more than we use.

That is even more true in the case of natural gas. Our year's supply in sight of natural gas in the country is about 29 times annual consumption.

Senator MILLIKIN. I am not directing my attention to general reserves. I am directing my question to reserves basic to this particular source of supply.

Mr. PIKE. Yes, sir.

Senator MILLIKIN. I will ask you again: Was an expert appraisal of those reserves made on behalf of the Commission?

Mr. PIKE. Not by us, Senator. Of course, the Federal Power Commission has the duty of looking into these reserves whenever one of these pipe lines comes up for permission to move additional gas to the North and East, and we are one of the, you might call them, subsidiaries of one of those applications.

Each time the gas company has to prove to the Federal Power Commission that it has enough gas to fill their contracts for a reasonable time; and I rather think they call a reasonable time around 20 years.

Frankly, if we can save a million and a quarter dollars for 20 years and then are cut off, we would feel that we had done a good deal.

Senator MILLIKIN. Certain economic dislocations are involved if you are making a revolutionary change of that kind. You are naturally affecting the existing coal economy, and it is a relative question.

Mr. PIKE. Yes, Senator. As near as I can estimate, the change from coal to oil will probably mean 300 or 400 coal miners out of work. I hope they will sell the coal somewhere else.

If you will pardon me, sir, in managing an enterprise, it seems to me that you buy the lowest cost fuel that will fill your bill. We have dropped, for instance, in this same plant at Oak Ridge through better economy of operation—we have dropped 5,000, and more, men off.

As a person, I am sorry they had to go out and find other jobs. Trying to run a business, you get your supplies at the best possible price, and I think here—and I am leaving out the matter of precautions for the fuel—just as a matter of business, we are saving a million and a quarter a year on what is practically a guaranteed price over a period; and if the recent history of coal prices is any good, I may feel even happier as time goes on.

Senator MILLIKIN. My point was directed to how soundly you had estimated your gas supply, which would go to how soundly you had

estimated the pros and cons of the economic disbalances that might result from what you are doing.

Mr. PIKE. No, sir. Unless I am very much mistaken, we did not make an independent estimate of the supplies of the Texas Gulf Coast.

However, I think this is fair to say: There are generally accepted figures, which both the oil and gas industries accept, and, as you know, in that area the two are inextricable because most of the gas comes along with some oil, and practically all the oil has some gas coming out of it.

So, it is very much to their advantage to keep running estimates of what the productive facilities are, and I have been quite familiar with oil and gas estimating for 20 or 25 years.

There are two things in looking back, you almost always find. One is that while you are estimating your reserves here, they are finding some more reserves there. So that your estimates are all low for that purpose.

Then, the other one is that, due to the natural conservatism of engineers, in regard to the reserves you already have in sight, the estimates prove to be inadequate. You have more gas than is estimated.

Senator MILLIKIN. Who did you say is the proposed supplier of the gas?

Mr. PIKE. Tennessee Gas Transmission Co. is the main pipe line.

Senator MILLIKIN. You say that is a new company?

Mr. PIKE. I think it first went into operation in 1943 or 1944.

Senator MILLIKIN. What I am driving at, Mr. Commissioner, is the general over-all statistics on gas reserves may be entirely worthless for your purpose.

Mr. PIKE. That is right.

Senator MILLIKIN. The question is: What reserves—I may add that I have a little experience with this, too—what reserves are available to the fellow supplying you with gas?

Mr. PIKE. Tennessee Gas Transmission line has to make that proof every time they go up to the Power Commission, as you know. We are quite familiar with the proofs they made, and I would stake what little reputation I have as an oil and gas expert that those estimates are underestimates.

Mr. WILLIAMS. I would like to continue with a further note which I believe is pertinent. This data was taken from table E, page 13, of the Federal Power Commission report for 1947, entitled "Consumption of Fuel for Production of Electric Energy, 1947."

This report shows that gas was consumed in 33 States of the Union in a total of 373,000,000,000 cubic feet in 1947 by electric utilities for the production of electric energy.

We discussed with the Federal Power Commission, since we did not have a report for 1948, this matter; and we asked for the figures for 1948.

It was stated over the phone that the total gas consumed in production of electric energy in 1948 was 478,000,000,000 cubic feet. This amounts, I believe, to about 15 percent of the electric energy generated by fuels in the United States.

So, the use of natural gas for the generation of electric energy is not something new.

Senator HICKENLOOPER. Mr. Williams, further referring to the report of the subcommittee, they state there that the Federal Power

Commission states in its certification for this line that it is based solely on the basis of the strong representations made by the Atomic Energy Commission that natural-gas service in its Oak Ridge facilities is necessary for the common defense and security of the Nation. Then, further:

The subcommittee waited until the Federal Power Commission made its determination in this case in order not to interfere with the normal quasi judicial procedure. The Federal Power Commission stated that its decision rested solely on this certification by the Atomic Energy Commission. Therefore, the subcommittee has examined the situation with particular concern about the validity of the certification by the Atomic Energy Commission that this pipe line is necessary for the interest of the common defense and security, within the meaning of section 5 (b) 5 of the McMahon Act.

Then, in a letter which Mr. Durham, who was chairman of the subcommittee, addressed to Mr. Lilienthal on the 2d, he states, among other things, as follows:

Since the recent hearing did not satisfy me or the other members of the subcommittee on the security question, I would very much appreciate a letter from you, preferably one suited for publication, stating why enlargement of the coal stock pile would not furnish as much, if not more, security with respect to K-25 as the planned pipe line.

A letter was written on May 9 in reply to that, signed by Mr. Sumner T. Pike, Acting Chairman, discussing the question raised in Mr. Durham's letter to Mr. Lilienthal.

Now, I presume that these matters were canvassed with the subcommittee, were they not, Mr. Pike, as hearings were had by the subcommittee with the Commission representatives?

I believe, Mr. Pike—did you not testify before the subcommittee?

MR. PIKE. Yes, sir; I was over there.

Senator HICKENLOOPER. Did you, Mr. Williams?

MR. WILLIAMS. No, Senator; I was away at the time. I believe Mr. Bloch was present.

Senator HICKENLOOPER. I notice the reference to Mr. Bloch, but it did not indicate that you were not there, and I did not know whether you were present or not.

So that these matters were gone over with the subcommittee, and the subcommittee came to a unanimous conclusion that this line, in its opinion or the opinion of each of its members, was not necessary and that the coal situation was adequate.

I merely call attention, Mr. Chairman, to the fact that, whereas, some suggestion has been made in the past that because the joint committee did not specifically insist on other action being taken, the action that was taken therefore must be O. K., that in this case, where there is positive and unanimous action, not only of the subcommittee but of the full joint committee, nevertheless, it had no influence on the going ahead with this project and the expenditure of \$10,000,000, which this committee came to the conclusion, unanimously, was not in the best interests of the program and should not be done.

MR. PIKE. May I comment, Senator, on four or five of the comments?

Senator HICKENLOOPER. Just one statement to clear that up. The law does place the legal responsibility and the authority for the decisions in the Commission. The committee does not have authority under the law to order or direct or stop or compel—

MR. PIKE. You have made that clear.

Senator HICKENLOOPER. The Commission to do anything. I am trying to emphasize that point, and in this case, apparently the unanimous opinion of the joint committee had no influence whatsoever on the Commission's action.

Mr. PIKE. Senator, if I may speak as an individual here, if there had been relevant points in the joint committee's report of force enough to have convinced us that our decision was wrong, I would have been the first one to have said "We should reverse the decision."

Now, I am not of that opinion, and if you have time for me to point out two or three of the items in the subcommittee's report, I should like to show you why. I really believe, in this case, the Commission is right and the committee is wrong. That could happen, and I think you are wrong here.

Senator MILLIKIN. The reverse could happen.

Mr. PIKE. Yes, sir; it has, many times probably.

Mr. COLE. It never has been admitted, has it, by the Commission? This is the first time I ever heard the Commission admit it was wrong with respect to any recommendation that had come out of this committee. It is not important at the moment, but I am surprised to hear you say it.

Mr. HOLIFIELD. Mr. Chairman?

The CHAIRMAN. Mr. Holifield?

Mr. HOLIFIELD. I think that this is the kind of a thing which should be done by the committee under its present legal limitations; that is, to hold hearings on specific things and make recommendations.

I recognize the validity of Senator Hickenlooper's statement that we do not have the power to compel the Commission to do certain things, but I submit that this is a unique case here where the committee did proceed, as I think it should proceed, and came out with a definite recommendation.

Now, after the committee has discharged its duty along that line, then, certainly, the Commission knows how the committee feels on it. It has taken formal action.

Then, if the Commission goes ahead on its own and does what it thinks to be best, it assumes that responsibility openly, knowing that it is in disagreement. It, at least, has had time to consider our objections.

Now, I participated in these hearings. I do not entirely agree with the report of the subcommittee personally, because I think that Mr. Pike made perfectly clear in his testimony that this would save the Government a million and a quarter dollars a year at present prices of coal and gas. I think he made perfectly clear that the contract which they had signed brought to this community at a cost of approximately 22 cents as against 30 or 40 cents in surrounding cities, gas, which was an advantageous contract as far as the Commission was concerned. So I believe that you were on sound economic grounds.

Now, as to your position that this pipe line should be certified on the basis of national defense needs, I frankly think that your Commission is weak on that point. I believe that doubling the stock pile—and I so proposed myself at the hearings—at the cost of \$7 a ton—and I believe you are using about 50,000 tons a month.

Mr. WILLIAMS. Sixty-four, approximately.

Mr. HOLIFIELD. That is at the rate of about 200,000 tons, which is roughly \$1,400,000 investment in an additional stock pile, and that

would have given you an additional 90 days' stockpile over the 90 days that you carry, and I think that would be sufficient for any strike that might occur.

So I think that the Commission did choose between an investment of \$1,400,000 in additional stock-piling and going to a means of fuel which in the long run will be much more economical to the Government.

So it is a matter of judgment, as I see it, and I know the Commission can make its own case.

The CHAIRMAN. Mr. Holifield, regardless of the merits of this particular controversy, as to whether the joint committee was right, or the Commission was right, I take it that it is your thought that an amendment to the act is in order to provide that projects which shall exceed a certain dollar value, without trying to set it at the moment, should be authorized by the joint committee in much the same fashion that the military has to get the clearance of a committee of Congress before proceeding.

Mr. HOLIFIELD. I agree with you 100 percent. I think it is clearly indicated that the joint committee, in order to discharge its function properly, should be given the same power of authorization as is given other committees of the Congress preceding the Appropriations Committee's action.

The CHAIRMAN. You take the reactor site, for example. That is going to run into over a half-billion dollars. Of course, we had hearings, quite extensive hearings, in regard to the reactor site; but if we had found ourselves in disagreement on it, we would have found ourselves powerless to do anything about it. That is the situation.

Mr. HOLIFIELD. Yet we are responsible to the taxpayers of the United States for being a so-called watchdog committee; and yet the act as it is now constituted does not give to this committee the power to function and discharge its responsibility to the taxpayers properly, in my opinion.

Senator MILLIKIN. Mr. Chairman?

The CHAIRMAN. Senator Millikin?

Senator MILLIKIN. What is the length of this line, 180 miles?

Mr. PIKE. Yes, sir.

Senator MILLIKIN. What is the size of the line?

Mr. PIKE. 22 inches in diameter.

Senator MILLIKIN. How many tons of steel will be used?

Mr. PIKE. My memory is it came out first as 28,000. I think it was cut to about 25,000 tons.

Senator MILLIKIN. Does that come out of a short market?

Mr. PIKE. Quite short at the time.

Senator MILLIKIN. That was a factor to be considered.

Mr. PIKE. Yes.

Senator MILLIKIN. It had national economic significance.

Mr. PIKE. Yes, sir.

Senator MILLIKIN. Does that have any relation to a point that was made that the National Resources Board was not considered? Did someone make the point that the——

Senator HICKENLOOPER. The report states that.

Mr. PIKE. I could not relevance there. We did go before the Department of Commerce, which had the, I believe they call it, voluntary allocation function and stated our views and our needs. There was a lot of pipe going to one gas line or another.

Since then, I might say, the whole steel situation has loosened up very much, and I believe the delivery of the first lot of pipe was made around in the last 2 or 3 weeks.

Senator MILLIKIN. So far as the timing of the line is concerned, that would be a very important factor.

Mr. PIKE. We wanted to get the line in as soon as possible.

Senator MILLIKIN. Everybody else wanted steel at the same time.

Mr. PIKE. There was a scramble for steel pipe.

Senator MILLIKIN. From an over-all standpoint, there was a question of priority.

Mr. PIKE. Yes, sir. We got into the scramble.

Senator MILLIKIN. What will be the length of the life of Oak Creek?

Mr. PIKE. I wish I knew.

Senator MILLIKIN. The subject is highly evolutionary, is it not?

Mr. PIKE. I suppose it is. It is highly evolutionary, but I would suspect that a great deal of the evolution would take place right there. I cannot predict very well on that.

Senator MILLIKIN. There is a speculation at that end of the line?

Mr. PIKE. Yes, sir; so I cannot appraise that.

Senator MILLIKIN. You might be committing yourself to a bail-out operation that might surpass the life of the enterprise at that point.

Mr. PIKE. Well, I do not believe, Senator, since, as I remember it, our commitment only runs for 4 years—it may run as high as 7. I wish I had that.

Mr. COLE. Three years, is it not?

Mr. PIKE. Possibly, sir. I think we can see ahead that far.

Senator MILLIKIN. I think so, too.

Mr. PIKE. I think it is a good bet.

Senator MILLIKIN. What about strikes shutting off the source of your supply of gas?

Mr. PIKE. Well, I will say this: that we have two rather unrelated sources here. Gas comes from an area down in Texas and goes through one method of transportation. Coal comes from nearby and goes over railroads.

I suppose there is a possibility of a strike on all of them. The history of it is that there is a much higher probability of strikes and other work stoppages, such as the one that is going on now, in the coal business than there is in either the oil or the gas business.

Senator MILLIKIN. I would say that is true, but strikes have been known in oil and gas fields.

Mr. PIKE. In oil refineries; yes, sir. They are almost unheard of in oil fields and gas fields.

Senator MILLIKIN. Gas is a byproduct of an oil refinery. A strike at an oil refinery affects the supply of gas.

Mr. PIKE. None of it will be a byproduct of oil refineries. Some of it will be a byproduct of oil production in the field. As you know, when oil comes up, gas comes out in solution.

Senator MILLIKIN. Is there any reason why there could not be a strike at the well?

Mr. PIKE. No, sir; none at all, except they are usually about as well paid as anybody in the business, and I think that, perhaps, is a factor.

Senator MILLIKIN. I want to say I cannot recall a strike of that kind, as far as gas is concerned.

Mr. PIKE. There may have been a wildcat strike.

Senator MILLIKIN. Is there any reason why there might not be if a wage dispute or other labor dispute might develop?

Mr. PIKE. I think you can say this: that the oil companies have been as intelligent cooperators with the labor force as any group in industry in the country.

Senator MILLIKIN. That is true.

Mr. PIKE. And then to take it from the point of view of the poor fellow who wanted to organize a union. In trying to organize an oil field you have to go over a tremendous territory, whereas in a refinery or a coal mine he has the boys right there.

Senator MILLIKIN. The aggregate of the employees who look after the gas field is quite sizable.

Mr. PIKE. Yes.

Senator MILLIKIN. And, even though the distances between the places of work of the employees may be great and the places may be somewhat scattered, yet I should think that might be organized as well as any other branch of industry.

Mr. PIKE. I suppose it could happen. I figure as a businessman first that it is a low-rate risk.

There is another point here, too. Coal, when it comes to the top of the ground, is about 60 to 70 percent labor. Any change in the hourly wages of labor means a distinct change in the cost per ton of coal. This is in the nature of things. There is no way to get around it.

I had the ill fortune of having to price the oil, coal, and natural gas in the United States during the war for OPA, and I hope that never happens again.

In the cost of gas at the top of the ground is roughly about 5 percent labor. Oil is 10 or 11 percent; coal is 60 or 70. So, frankly, if I were an industry running a natural-gas company, I could be fairly generous with my wage rates and working conditions, and it would not cost me very much.

Senator MILLIKIN. Especially if your purchasers are generous.

Commissioner, what are you paying for this gas?

Mr. PIKE. This gas will cost us between 20 and 22 cents a thousand of between 1,000 and 1,100 B. t. u. gas delivered at Oak Ridge. It is a good price.

Senator MILLIKIN. What is the field price of gas?

Mr. PIKE. The field price runs around 5 cents.

Mr. HOLIFIELD. The comparison, as far as the local area is concerned, in the cost of fuel should be with the towns of Knoxville and Chattanooga and other towns that are now paying 30 to 40 cents, as I understand.

Mr. PIKE. That is a typical gas rate as you go into a city. The comparison that hits us is this—the equivalent costs of the two. The coal is costing just about \$7 a ton, and at the rate we are getting the gas it is the equivalent of about \$5 a ton.

Mr. HOLIFIELD. And your computation of saving a million and a quarter is not on a price of \$7.14, but on an average price of \$6.50, is it not?

Mr. PIKE. I think that is right.

Mr. HOLIFIELD. That is your testimony before our committee. So actually your saving of one million and a quarter is based on a 64-cent-per-ton conservative calculation.

Mr. PIKE. I think we were conservative. I would like to go over the whole calculation and make absolutely sure.

The CHAIRMAN. Mr. Elston has a question.

Mr. ELSTON. There is one matter you have not touched upon, and that is the possible scarcity of gas in cold weather. Now, the States that are now using natural gas, such as Ohio, Indiana, Illinois, and some of the other States—and they derive their gas from this same source—suffer from a very severe shortage of natural gas in the wintertime.

Mr. PIKE. Yes, sir.

Mr. ELSTON. When the temperatures are very low.

Mr. PIKE. Yes, sir.

Mr. ELSTON. Now, what assurance have you got that you will not suffer in a similar manner at K-25?

Mr. PIKE. Well, of course, one reason, Mr. Elston, for the shortage of gas in the communities is a very simple one, which we are all used to. When it is very cold in a community, you use a great deal more gas than you do on a normal day, so that a pipe line which is used for the supply is very heavily drawn upon.

In this case, our requirements will be the same on cold days and hot days, so that this line should give us a pretty good supply. Our demand will not fluctuate the way domestic demand does.

As you know, in your area, up until a very, very few years ago, you got most of your gas from a West Virginia-Kentucky area nearby. If you ask me, as a matter of management, I would say that in your area the Columbia Gas people waited too long before they went out and got extra supplies of gas; and you, as consumers, have suffered a little bit on cold days from that. They are using some gas from this very group. They also use gas from the Panhandle.

Now, there is a very clear thing in the economics of natural-gas use and transmission. The longer your line, the greater amount of investment per unit of gas moved. But, no matter how big your investment is, a line of a given diameter will not move any more gas if it is a thousand miles long than if it is a hundred miles long.

When Cincinnati first went to mixed gas, they used manufactured gas to fill in on the cold days. People up at Detroit are now bringing gas in in the summer and putting it back into an old depleted gas field to fill in on cold days. Other people use propane and butane. Just as much gas will move through the lines.

Now, in this case, our demand will be a steady demand. Our chances of running short of gas, I would say, would be quite small. If we do, however, we will have the stock pile there. I would figure that a stock pile of coal for emergency use should always be handy.

Mr. ELSTON. How long does it take you to change back from gas to coal?

Mr. PIKE. It can be done within 24 hours.

Mr. ELSTON. So that there is the possibility that you may suffer from a shortage of natural gas as well as users in the North.

Mr. PIKE. I would say that the chances were extremely remote, Mr. Elston. One reason I like a completely independent source of fuel, a completely independent kind of fuel, and a completely in-

dependent method of transportation—Mr. Williams tells me that the way our burners will be set up it will take no time at all to change, and we can actually burn both coal and gas in the boilers at the same time—so technically it is an easier problem than I had thought.

Mr. ELSTON. If you are going to be assured of a supply, it follows as a matter of course that domestic and industrial users in other areas would suffer even more than they do now.

Mr. PIKE. I do not think so, Mr. Elston. As you know, there is a tremendous lot of gas pipe line mileage being put in this year and is under construction for next year. The gas we are using is excess gas that is coming up from Texas. We will not dip into gas that was available last year.

Mr. ELSTON. You brought out that transportation was a serious problem so far as coal was concerned, and you only mentioned the lack of cars. Now, as a matter of fact, you can transport coal to Oak Ridge by both truck and by barge as well as by railroad, can you not?

Mr. PIKE. I suspect you could. I am not an expert on barge transportation. I think we have one here, an expert on barge transportation on the Tennessee River.

Mr. Lilienthal would know about that, probably. Obviously, it could be brought in by truck if the mines were working. I suspect it would be a costly job to do. It would be the kind of thing you would do if you could.

Mr. ELSTON. How close are the mines?

Mr. PIKE. Mr. Williams knows more about that than I do?

Mr. WILLIAMS. There are mines that supply coal within 50 miles.

Mr. ELSTON. Is that the only source of your coal supply?

Mr. WILLIAMS. Well, we have the United States, but we have been buying, of course, our coal in an area of approximately 100 miles.

Mr. ELSTON. So that you have gotten all your supply of coal within an area of 100 miles?

Mr. WILLIAMS. I think, when we were in such dire straits we, as I indicated in my remarks in the beginning, the limitation on the purchase of coal was taken off, and we did get some at a greater distance during that period in order to build up our stock pile.

Mr. ELSTON. Now, there is no shortage of space at Oak Ridge for stock piling of coal; is there?

Mr. WILLIAMS. We have a great deal of space at Oak Ridge.

Mr. ELSTON. So that is not a problem at all?

Mr. WILLIAMS. It is not a problem if you forget economics completely.

Mr. ELSTON. Now, let me ask you this: When was this committee first notified of the Commission's intention to enter into a contract for the supply of natural gas to Oak Ridge?

Mr. WILLIAMS. February 9, 1948, the committee was notified. And then there was a letter from Senator Hickenlooper to Mr. Carroll Wilson on February 17, 1948, and then there was a letter from Mr. Wilson to Senator Hickenlooper, marked "Confidential," on March 18, 1948, giving some technical reasons which required that classification.

Mr. ELSTON. After this committee took action disapproving of this contract, what action did the Commission take?

Mr. PIKE. Perhaps I had better answer that, Mr. Elston.

We had a meeting, went over the criteria and considerations on which we decided to have this line built. It seemed to us that the considerations were even more compelling than they had seemed in the first place. We looked over the report of the subcommittee and found what seemed to us to be obvious errors in it or magnifications of rather trivial items into large ones.

So, in the balance, our judgment remained about the same. At least, mine did. I do not think we took an actual revote on the thing, but we did have a considerable reweighing conversation about the line.

Mr. ELSTON. In other words, you simply discussed it?

Mr. PIKE. Yes, sir.

Mr. ELSTON. And the Commission actually took no action one way or the other?

Mr. PIKE. We had already taken the action.

Mr. ELSTON. You had taken the action before this committee made any recommendations.

Mr. PIKE. Signed the contract, I think, last summer, Mr. Elston.

Mr. ELSTON. Did you take any action at all to suspend the operation of the contract after this committee began its investigation of the matter?

Mr. PIKE. I am sorry, sir, I did not get that.

Mr. ELSTON. Did your Commission take any action at all to suspend the operation of the contract?

Mr. PIKE. No, sir.

Mr. ELSTON. After you knew that this committee had begun an investigation of the entire matter.

Mr. PIKE. No, sir. I will tell you what ran through my mind. We thought that probably we should have a hearing before the whole joint committee on the matter.

Now, it had been a fairly hectic several weeks, and the first thing I knew was that we got a note saying that the whole joint committee had adopted the report of the subcommittee. I think, perhaps, we should have requested formally a hearing before the joint committee of the whole matter. I do not think we did.

Mr. ELSTON. You did not even request that kind of hearing, did you?

Mr. PIKE. Mr. Elston, I do not think we did.

Mr. ELSTON. You did not give the subcommittee any indication that you wanted to call any additional witnesses or present any more testimony, did you?

Mr. PIKE. I do not remember that we did; no, sir.

Mr. ELSTON. In other words, the subcommittee had every reason to feel that you had presented all the testimony you cared to present.

Mr. PIKE. Our General Counsel informs me that we had a letter all ready to send to you and then we got the report.

Perhaps, Mr. Volpe could explain it. He knows more about that than I do.

Mr. ELSTON. I hope so.

Mr. VOLPE. Mr. Elston, the subcommittee report was issued and, apparently, approved by the committee within a matter of a day or so.

Mr. COLE. Four days.

Mr. VOLPE. The Commission, when the report was received, asked the Director of Production, Mr. Williams, to restudy the matter and to bring the matter again before the Commission. This was done.

Following that discussion, the Commission asked for a letter to the joint committee, requesting an opportunity to be heard and advising the committee that it had reviewed the matter; it was still of the view that the action which had been taken was right. Before this letter could be sent, we were advised that there would be an open hearing on natural gas within a matter of a day or so, and the letter was not sent.

Mr. ELSTON. You did have a hearing before the subcommittee and considerable time elapsed between the hearing and the making of the report. That was more than 4 days.

Mr. PIKE. That is true, Mr. Elston. If you ask me, I thought we had made our case. The chairman, Mr. Durham, sent us a letter stating some defects in that he thought we did not make a complete presentation. We sent a letter to him in reply, and we had no notice that you were not completely satisfied with our presentation until we got the report of the subcommittee.

Mr. ELSTON. You yourself were satisfied with your own presentation, were you not?

Mr. PIKE. I thought we had convinced you that we had done the proper thing.

Mr. ELSTON. Although you knew the matter was under investigation and it was a pretty serious matter, the Commission took no action whatever to suspend the operation of the contract until this committee could decide what it wanted to do about it?

Mr. PIKE. No, sir. That is correct.

Mr. ELSTON. Then after the report was made and the full committee had concurred in it, the Commission did not even have any formal meeting, but simply discussed the matter and took no action whatever.

Mr. VOLPE. Mr. Elston, may I comment on that, sir?

Mr. ELSTON. Yes.

Mr. VOLPE. We notified the joint committee that the Commission was considering a gas line at Oak Ridge on February 9, 1948. There was again correspondence on February 17, 1948, and again on March 18, 1948, on June 23, 1948, on October 5, 1948, on December 13, 1948, and hearings before the Federal Power Commission.

A contract had already been made, the Federal Power Commission had already issued a certificate, when the subcommittee of the joint committee decided to hear this matter. At that time we presented our case, which had been previously presented to the joint committee in correspondence, and it was not until after the subcommittee had issued a report that we had any indication that the subcommittee or the joint committee disapproved of what the Commission had done more than a year ago.

So that this is not a matter of our being advised in advance of action that there was disapproval on the part of the joint committee. This was more than a year after the action had been taken and it was subsequent to the issuance of a certificate by the Federal Power Commission.

Mr. ELSTON. Well, the fact that you entered into the agreement a long time ago did not alter the fact that you could not go ahead with the agreement until the Federal Power Commission had acted.

Mr. VOLPE. That is right, sir.

Mr. ELSTON. And the Federal Power Commission did not act until when?

Mr. VOLPE. I do not have the date handy, but that can be checked.

Mr. COLE. May 3.

Mr. ELSTON. May 3, 1949. They did not act until May 3, 1949.

Mr. VOLPE. That is right, sir.

Mr. ELSTON. And the hearings before the subcommittee were held on Monday, May 2, 1949.

Mr. VOLPE. But the contract, Mr. Elston, with the East Tennessee Natural Gas Co. to build this line to supply natural gas to the Atomic Energy Commission was executed in the summer of 1948, and this we informed the joint committee on.

The CHAIRMAN. May I see that correspondence?

Mr. ELSTON. I grant you the contract was entered into, but nothing was done to carry out the provisions of the contract and could not be done until the Federal Power Commission had acted.

Mr. VOLPE. That is right.

Mr. ELSTON. So that you could, if you had seemed disposed to do so, have tried to suspend the operation of the contract, and nothing would have been done.

Mr. VOLPE. Mr. Elston, as the subcommittee well knows, a great deal happened between the time the contract was executed and the time the Federal Power Commission issued a certificate.

Mr. ELSTON. But no work was done.

Mr. VOLPE. No work was done, but the East Tennessee Co., on the basis of a contract which it had made with an agency of the United States Government, took steps to fulfill that contract if and when a certificate was issued by the Federal Power Commission.

Mr. ELSTON. Yes, in other words, everything was contingent upon action of the Federal Power Commission.

Mr. VOLPE. That is right, sir.

Mr. ELSTON. And that did not take place until in May of this year.

Mr. VOLPE. That is right.

Mr. ELSTON. Now, the point I am making is that the Commission did not do a thing during the pendency of this hearing before the subcommittee to suspend the operation of the contract until this committee had decided the matter.

Mr. VOLPE. Well, Mr. Elston, I assume that the question is to indicate that the Commission ignored the fact and was not reasonable in its behavior because a subcommittee had decided to hold a hearing; and what I am suggesting, sir, is that the committee had knowledge of this since February 1948, and the committee could have raised these questions which have now been raised prior to any hearings before the Federal Power Commission.

The questions that the committee has raised go to the question of whether or not this line is needed in the interest of the common defense and security of the United States; and for this committee to make inquiry into that question, this committee did not have to await the ruling of the Federal Power Commission.

Mr. ELSTON. Never mind criticizing this committee.

Mr. VOLPE. I am not criticizing, sir.

Mr. ELSTON. This committee did not have to have any hearings until the Federal Power Commission had acted. If the Federal Power Commission had denied your application, there would not be any

reason for any hearings, and it was only after the Federal Power Commission granted your application and granted it solely on the ground that it was in the interest of national defense, that there was any necessity for a hearing by this committee.

And when this committee proceeded immediately—in fact, started even before the decision of the Federal Power Commission—and rendered a unanimous report condemning the entire project, or at least disapproving of it, the Atomic Energy Commission did nothing more than have a discussion about it and did not even go through the formality of passing upon the report of this committee.

Now, that is true, is it not?

Mr. PIKE. We reviewed the situation, Mr. Elston, pretty completely.

Mr. COLE. What was done with respect to a review?

Mr. PIKE. Well, we set Mr. Williams to work going over all the criteria and considerations that we had gone over in deciding to get this other source of supply. We met. I cannot remember exactly what was said, but we went over the thing pretty well in our minds. We did not think, frankly, that the reasons that the committee gave for disapproval were very good ones.

I still think they are not very good ones. We did figure this—and this I do not think was given sufficient weight by the subcommittee—that this is a highly essential plant, there is no need of my emphasizing to this group how essential its continuous operation is. This is an instance where a risk of shutting down was pretty unthinkable.

Here we get a completely independent source of supply—again, at a saving of over a million dollars a year to the Government—and when we can remove a risk and save money, too, it seemed to me that we had something we ought to go right ahead with.

There is not a bit of use of our thinking if an emergency should come along and we wished we had done it, that we could get gas immediately. It takes a long while to get a new gas line through. You have to go, as you say, before the Federal Power Commission, you have to arrange for your gas supplies, you have to arrange for your pipe, you have to arrange for building. It is a long road.

We would rather be ready for an emergency, whether or not it appears, than to have an emergency hit us and not be ready.

Mr. ELSTON. Mr. Pike, was the subcommittee wrong in saying that you did have ample facilities to build up a stock pile of coal?

Mr. PIKE. No, sir; it was not completely wrong. I do not think it is a terribly revelant point. My feeling is this:

That the gas is a better thing because it is completely independent, both in transportation and form of fuel. To stock-pile more coal is a possible thing. It is pretty expensive, it would cost the Government a great deal more and would still tie us to an annual expense of a great deal more than we will be tied to here.

Mr. ELSTON. You cannot stock-pile gas, can you?

Mr. PIKE. No, sir; not to any great extent. You can stock-pile gas a little.

Mr. ELSTON. Was the committee wrong in pointing out that a pipe line was more susceptible to sabotage?

Mr. PIKE. Than what?

Mr. ELSTON. Than using coal.

Mr. PIKE. Well, I think that is arguable. A pipe line is not much more susceptible to sabotage than a railroad. Rails break every now

and then and you get wrecks. You do get pipe-line breaks. It takes about the same time to repair them.

There is no great history of sabotage of pipe lines in this country. There are histories of pipe lines leaking, and they use regular patrol and section people, the way the railroads do, to see that their stuff is in running condition.

Mr. ELSTON. Now, a great deal of the pipe line is up through the mountains and country that is not patrolled like a railroad is patrolled.

Mr. PIKE. It is patrolled, Mr. Elston; a main pipe line is always patrolled.

Mr. ELSTON. Not the same as a railroad.

Mr. PIKE. I do not suppose you have a man every mile, but it is pretty efficiently patrolled, and you can catch, incidentally, a pipe-line accident much more quickly than you catch an incident of railroad stoppage, which you do not catch, probably, until either the next train or section hand comes along.

If there is a leak in the pipe line, you will get it in a matter of minutes through a drop in pressure at the station.

Mr. ELSTON. You say the committee was inaccurate. In what respects were they inaccurate?

Mr. PIKE. For instance, in saying we might have used the facilities of an oil pipe line that went 17 miles away. That is a crude-oil pipe line, and crude oil is completely unadaptable for burning in a boiler. That is one point.

Now, I do not say that it made inaccurate statements, but now the statement that we did not go before the National Security Resources Board—it is not inaccurate. We did not. I still have to find out why we should have. We have never found out why we should have.

The statement at the end that substantial improvement was not given full weight; well, it is not inaccurate, but it is not complete. We did look at a lot of things which had happened. We looked at what had happened to the price of coal in the meantime. We also recognized that the coal business is a business that is subject to a great many hazards of delivery, and we do not need to develop the point. You know it as well as I do.

Mr. ELSTON. When you have built up a stock pile of coal, you have a stock pile of coal for how many days?

Mr. PIKE. I would say about 90 days.

Mr. WILLIAMS. We have at the present time 180,000 tons.

Mr. ELSTON. Is that 90 days' supply?

Mr. WILLIAMS. Well, it takes 64,000 tons a month. So that is about 3 months or 90 days for two boilers.

Mr. ELSTON. About a 90-day supply.

Do you know of any coal strike that has lasted 90 days?

Mr. WILLIAMS. We were affected, I believe it was in March 1946, for a period of 60 days.

Mr. ELSTON. How were you affected?

Mr. WILLIAMS. We were affected in that we did not get any coal. Our coal deliveries were cut way down.

Mr. COLE. To the extent of 20 percent of your requirements, was it not?

Mr. WILLIAMS. No, sir; it was cut more than that during this period. It was during the period August 1946 to August 1947, when

there was no strike, that it was cut down, where we were getting all the coal we could get.

Mr. ELSTON. You do not mean you had to stop your facilities from operating?

Mr. WILLIAMS. No, sir; because we had stock-piled some coal, but I was just answering a question, sir, that we were affected at this time for a period of 60 days. That is, the delivery of coal was affected for a period of 60 days.

Mr. ELSTON. Were there any other inaccuracies?

You have accused the committee of being inaccurate. I wish you would cite them.

Mr. COLE. I wish you would include the items characterized as trivial by Mr. Pike in the committee report.

The CHAIRMAN. We are running over our stated time. I do not wish to cut you off in the middle of your questioning, Mr. Elston.

Mr. ELSTON. These gentlemen will both be here again, and I can continue at a later time.

The CHAIRMAN. I think we must adhere to the rule.

Mr. ELSTON. I do, too.

The CHAIRMAN. We will recess until Monday morning at 10:30.  
(Whereupon, at 1:05 p. m., a recess was taken until 10:30 a. m., Monday, June 20, 1949.)

## JOINT COMMITTEE ON ATOMIC ENERGY

(Created pursuant to Public Law 585, 79th Cong.)

**BRIEN McMAHON**, Connecticut, *Chairman*

**CARL T. DURHAM**, North Carolina, *Vice Chairman*

**RICHARD B. RUSSELL**, Georgia

**EDWIN C. JOHNSON**, Colorado

**TOM CONNALLY**, Texas

**MILLARD E. TYDINGS**, Maryland

**BOURKE B. HICKENLOOPER**, Iowa

**ARTHUR H. VANDENBERG**, Michigan

**EUGENE D. MILLIKIN**, Colorado

**WILLIAM F. KNOWLAND**, California

**CHET HOLIFIELD**, California

**MELVIN PRICE**, Illinois

**PAUL J. KILDAY**, Texas

**HENRY M. JACKSON**, Washington

**W. STERLING COLE**, New York

**CHARLES H. ELSTON**, Ohio

**CARL HINSHAW**, California

**JAMES E. VAN ZANDT**, Pennsylvania

**WILLIAM L. BORDEN**, *Executive Director*

**HAROLD BERGMAN**, *Deputy Director*

**WILLIAM J. BERGIN**, *Editor*

# INVESTIGATION INTO THE UNITED STATES ATOMIC ENERGY PROJECT

MONDAY, JUNE 20, 1949

CONGRESS OF THE UNITED STATES,  
JOINT COMMITTEE ON ATOMIC ENERGY,  
*Washington, D. C.*

The joint committee met, pursuant to adjournment, at 10:35 a. m., in the Caucus Room, Senate Office Building, Washington, D. C., Senator Brien McMahon (chairman) presiding.

Present: Senator McMahon (chairman); Representative Durham (vice chairman); Senators Connally, Vandenberg, Millikin, Knowland, and Hickenlooper; Representatives Holifield, Price, Cole, Elston, Hinshaw, and Van Zandt.

Also present: David E. Lilienthal, Chairman; Sumner T. Pike, Commissioner; Lewis L. Strauss, Commissioner; Gordon E. Dean, Commissioner; Henry D. Smyth, Commissioner; Carroll L. Wilson, General Manager; Carleton Shugg, Deputy General Manager; Frances Henderson, Assistant to the Chairman; Brig. Gen. James McCormack, Jr., Director, and Capt. James Russell, Deputy Director, Division of Military Application; Walter J. Williams, Director, Division of Production; Joseph Volpe, Jr., General Counsel; Bennett Boskey, and Everett L. Hollis, Office of the General Counsel; Morse Salisbury, Director, Shelby Thompson, and Rodney L. Southwick, Division of Public and Technical Information Service; Edward Brosnan, Division of Security; all of the United States Atomic Energy Commission.

G. R. Prout, president and general manager, Nucleonics Department; H. A. Winne, vice president in charge of engineering; and Forrest D. Baker, comptroller, nucleonics department (Hanford works), of the General Electric Co.

The CHAIRMAN. Come to order, please, gentlemen.

When we finished on Friday, Commissioner Pike and Mr. Williams were answering some questions from Mr. Elston regarding the pipeline at Oak Ridge.

Will you gentlemen come forward, Mr. Pike and Mr. Williams?

**STATEMENTS OF SUMNER T. PIKE, COMMISSIONER, AND WALTER J. WILLIAMS, DIRECTOR, DIVISION OF PRODUCTION, ACCOMPANIED BY JAMES VOLPE, JR., GENERAL COUNSEL, UNITED STATES ATOMIC ENERGY COMMISSION**

The CHAIRMAN. Mr. Elston will proceed.

Mr. ELSTON. Mr. Chairman, at the time we adjourned on Friday, I had not quite completed asking Mr. Pike and Mr. Williams some questions about the natural-gas line to Oak Ridge.

I believe you stated, Mr. Pike, that you saw no particular reason for contacting the National Security Resources Board.

Mr. PIKE. Yes, sir; I did not, and I am still unclear as to why we should have.

Mr. ELSTON. Did you ever read the National Defense Act?

Mr. PIKE. No, sir.

Mr. ELSTON. You did not read it?

Mr. PIKE. No, sir.

Mr. ELSTON. Well, if you had read it, you would have found out that section 106 requires that Board to coordinate all demands on critical natural resources. Now, of course, the pipe that is used in this project is critical, is it not?

Mr. PIKE. Yes, sir.

Mr. ELSTON. As a matter of fact, this pipe line will take 6 percent of Tennessee Gas Transmission Co.'s supply to the Ohio Valley; will it not?

Mr. PIKE. If you use the 60,000,000 feet—and that is the plan, Mr. Elston—it will use about 6 percent of the billion feet toward which Tennessee Gas Transmission is building. That is as far as present plans go. They are not transmitting that much yet. They did not last year.

As you know, it is a very rapidly growing enterprise, and we will be using some of the additional gas which is coming through.

Mr. ELSTON. Then, you are not entirely correct in saying it would not take anything from the Ohio Valley.

Mr. PIKE. I meant it would take nothing from what they had before. We would be using gas, and obviously it is gas nobody else will be using if we use it.

Mr. ELSTON. I think you also indicated that this committee, which made its report, was incorrect with respect to the suggestion that fuel oil might be used for stand-by purposes.

Mr. PIKE. I did not say that fuel oil could not be used, but my own feeling is that it would be a bad third choice.

Mr. ELSTON. Why would it be bad?

Mr. PIKE. It was in pretty short supply last year, Mr. Elston.

Mr. ELSTON. Of course, you do not know whether or not gas itself would be an item that the National Security Resources Board should consider.

Mr. PIKE. Frankly, I do not know their complete duties, so I really don't know.

Mr. ELSTON. Who took the responsibility of not contacting that Board?

Mr. PIKE. I think I should, perhaps, defer to counsel, because it never occurred to me that we should have, until it was brought up in this report; and I still do not know why.

Mr. ELSTON. Notwithstanding section 106, you still do not see why?

Mr. PIKE. I never heard of section 106 until this moment. On matters of legality, we have to depend on the counsel.

Mr. ELSTON. Did you ask counsel for an opinion about it?

Mr. PIKE. I did not, because I never heard of the section until this morning. I do not know whether it is apposite or not.

Mr. ELSTON. You also stated the other day that you thought the gas that would go to Oak Ridge would not take anything from the Ohio Valley or from other sections because it was an additional supply.

**Mr. PIKE.** In the first place, at the time we worked out the contract oil was in extremely short supply, going back to that period. At the time it is not in short supply. It still is extremely expensive. It had to come in by tank car, which means railroad transportation; and, as I remember it, the cost would be equivalent to about \$17 per ton of coal as against about \$7 per ton, and the equivalent of about \$5 if we get gas as fuel.

**Mr. ELSTON.** That would be an item if you were counting on it all the time, but considering it solely from the stand-by position, you would not have to bring it in, in cars, because there is an oil pipe line just 17 miles from Oak Ridge, is there not?

**Mr. PIKE.** It is pretty close by, but it does not carry fuel oil. It carries crude oil.

**Mr. ELSTON.** It carries highly refined petroleum products, not crude oil.

**Mr. PIKE.** It does not carry residual fuel oil, which is what we would burn:

**Mr. ELSTON.** Are you certain that line does not carry fuel oil which you could use?

**Mr. PIKE.** No, sir; I am told so, and I suspect my information is correct.

(The following was later submitted for the record:)

The fuel oil line referred to does not and cannot carry bunker C fuel oil.

**Mr. ELSTON.** You said at one time there was a shortage of coal cars, did you not?

**Mr. PIKE.** There had been, yes, sir.

**Mr. ELSTON.** Was it so short that it impaired any of your operations?

**Mr. PIKE.** I think it did. Mr. Williams, of course, can answer that directly from first-hand information.

**Mr. ELSTON.** Well, did you do anything about getting a sufficient coal-car allocation?

**Mr. PIKE.** We tried pretty hard. Again, Mr. Williams has the background. I think he did some of that himself.

**Mr. ELSTON.** Whom did you contact?

**Mr. WILLIAMS.** This was covered in my statement on Friday. I can refer to it here and give the information again.

On April 12, 1947, information was furnished to the Washington office with the further explanation that the deficiency in replacements was primarily due to the shortage of coal cars, arising from the fact that large shipments of coal for export were requiring the use of many of the cars which otherwise would be available for the delivery of coal to Oak Ridge.

The Washington office interceded with the Transportation Corps, United States Army; the American Association of Railroads; and the Office of Defense Transportation in an effort to obtain assignment of cars to the Oak Ridge area for use in delivering coal to Oak Ridge.

These efforts were unsuccessful, except to the extent that ODT issued an order providing for the return of coal cars to the southern railroads, which counteracted a previous order which required that coal cars be returned to northern railroads.

On September 11, 1947, TVA was advised of the critical situation of the coal pile at K-25 and advised that a reduction would be made

in power generation on September 18. At this time TVA was critically short of power, and the water storage in three reservoirs had been reduced to a dangerous level. TVA was extremely anxious for us to continue to generate power at the same rate as before.

Meetings were held with TVA representatives on September 18, at which time arrangements were made for each agency to issue a coordinated telegram at 2 p. m. on September—this was September 15, the other day—on September 15, 1947, to John R. Steelman, urging that 200 coal cars be assigned for use in supplying coal to Oak Ridge.

On September 18, 1947, the Washington office advised Oak Ridge that it had received a reply from Mr. Steelman as to the request for the 200 coal cars to the effect that no cars were available for such assignment, but authorizing the procurement of coal in an unlimited area.

Mr. ELSTON. So you just took Mr. Steelman's decision and did not go any further?

Mr. WILLIAMS. He happened to be the one that we considered was in charge of this determination as to where the coal cars would go. We had contacted these other agencies before and had no success.

Mr. ELSTON. Well, the principal reason for not getting the cars was foreign export. They were needed for the foreign export of coal.

Mr. WILLIAMS. Well, that was the assumption. I do not know. The fact of the matter is that we did not have any cars.

Mr. ELSTON. So that if the matter became critical and cars were absolutely necessary, it would simply mean cutting down on the supply of coal cars used for the foreign export of coal?

Mr. WILLIAMS. That may have been. I am in no position to say because I do not know that those were the actual facts.

Mr. ELSTON. You did not consider it of sufficient importance to take it to the President, did you?

Mr. WILLIAMS. Well, I do not know what the Washington office considered. Mr. Steelman was the representative of the President, his office, and we did check with him.

Mr. ELSTON. All right. Now, you also stated the other day, did you not, that the subcommittee failed to give sufficient weight to the need for continuous production at K-25; is that right?

Mr. WILLIAMS. I do not recall saying that. I feel that probably the subcommittee gave less weight to it than I would. I happen to have been responsible directly for the Corps of Engineers for the construction of the plant, so I have somewhat intimate knowledge of the construction of the plant and also of the importance of the plant to the national picture. It may be that being so close to the picture, I am unduly cautious. I do not think so.

Mr. ELSTON. The report actually gives as its first conclusion a statement of the absolute requirement for continuous production. That is the report of the subcommittee. Do you remember that? It is the first thing the committee considered?

Mr. WILLIAMS. I do not disagree with it. I am in full agreement with that.

Mr. ELSTON. Now, Mr. Williams or Mr. Pike, either one, you stated the other day there would be a saving of money, I believe, over a million dollars a year.

Mr. PIKE. Yes, sir.

Mr. ELSTON. That is based on present rates?

Mr. PIKE. That is right.

Mr. ELSTON. Now, as a matter of fact, if there was an increase of just 3 cents in the gas rate, it would wipe out that \$1,250,000, would it not?

Mr. PIKE. No, sir.

Mr. ELSTON. How much would it have to be?

Mr. PIKE. I will have to give you my best guess and supply the figure. It would have to be around 10 cents.

Mr. ELSTON. Ten cents?

Mr. PIKE. Yes.

(The following was later submitted for the record:)

The gas contract has a two-part rate; (1) Demand charge of \$2.64 per 1,000-cubic feet per month; (2) commodity charge of 12.1 cents per 1,000-cubic feet used. At an average rate of use of 50,000,000 cubic feet per day the commodity charge would have to increase 6.85 cents per 1,000 cubic feet to wipe out the \$1,250,000 savings, or an increase of 56½ percent in the commodity rate. The demand charge does not change under the terms of the contract.

Mr. ELSTON. Did you in your fiscal year 1950 budget not provide for \$5,610,000 for conversion of facilities to gas?

Mr. PIKE. I do not think so, but I would have to have the budget in front of me.

(The following was later submitted for the record:)

This is essentially correct, the actual figure is \$5,613,000. This total appeared in the 1950 budget but was over a 3-year spread, fiscal years, 1949, 1950, and 1951.

Mr. ELSTON. What figures do you provide for? What do you think it will cost the commission?

Mr. PIKE. It will cost the Commission in dollars, the Government will pay out about \$240,000. I think you are probably referring to the fact that we do practically guarantee to continue to buy gas at this price over a period long enough to amortize out part of the cost of this line. This will come in the cost of fuel and that price is figured in the savings. I think technically we do have to set aside money to meet what you might call a contingent liability in case we do not use the gas. However, I do not have the budget figures at hand, and I am not quite sure that is what you mean.

Mr. ELSTON. Did you in figuring the difference in cost take into consideration the interest on the amount of money that the Commission would spend for conversion purposes?

Mr. PIKE. I do not believe we did because all we have to do is spend \$240,000, which would be wiped out in less than 3 months' saving.

Mr. ELSTON. Whatever you spend, regardless of whether it is \$240,000 or some other amount, proper bookkeeping would require you to take into consideration the interest item; would it not?

Mr. PIKE. That may be true, Mr. Elston. I am not quite clear on that.

For instance, in the suggestion that the subcommittee made of building up, doubling the coal stock pile, that would mean a permanent investment of around \$1,400,000, and I do not remember that interest was taken in on that. No; I do not believe we usually do figure interest, Mr. Elston, in the budgetary things. I am not a budget expert, as is very clear to you.

Mr. ELSTON. Where did you get your figures?

Mr. PIKE. From our own estimating people, who run the Oak Ridge plant.

Mr. ELSTON. Are they auditors?

Mr. WILLIAMS. These figures came from engineers and operators.

Mr. ELSTON. They did not take into consideration interest?

Mr. WILLIAMS. Well, if you took into consideration interest on this, you would also have to take into consideration the interest on the overcharge for coal, which we would be paying, and it would certainly be more than wiped out. An engineer's estimate does not ordinarily take into account interest on the money on Government work.

Mr. ELSTON. I wish you would check your figures on the amount of increase in the gas rate it would take to wipe out the savings to which you have referred.

Mr. PIKE. That will be easy to work out. I just do not have the figures.

Mr. ELSTON. I do not believe your figures are correct.

Mr. PIKE. My memory is it would take about 10 cents.

(The following was later submitted for the record:)

Six and eighty-five one hundredths cents per 1,000 M c. f. used, or  $56\frac{1}{2}$  percent of commodity rate.

That would give us the equivalent of about \$7 coal, and an increase of 10 cents would mean the tripling of the prices in the field, practically, which seems to me a very, very high expectation.

Mr. ELSTON. Now, Mr. Pike, there is nothing in your contract that prevents either the supplier or the distributor from increasing the price of gas.

Mr. PIKE. I think we are protected for quite a period. That is one thing about gas prices, Mr. Elston. You can contract ahead at practically a fixed price for quite a while. You cannot do that in either oil or coal usually beyond the current year. It is one good feature. You can protect yourself in gas prices in pretty good shape.

Mr. ELSTON. In article IX, section 4a (1) of your contract, there is a provision—is there not?—that, if the supplier sees fit to increase rates, those rate may be passed on to the Commission.

Mr. PIKE. I do not remember that it reads just like that.

Mr. ELSTON. Put it in the record exactly the way it is.

Mr. PIKE. Mr. Williams has the contract.

Mr. WILLIAMS. Article IX, Charges To Be Paid by Government; Section 4a, Adjustments. Is that the section, Mr. Elston?

Mr. ELSTON. Yes.

Mr. WILLIAMS. (reading):

The demand and commodity charges provided for in paragraphs 1 and 2, above, shall be subject to the following adjustments.

(1) Plus or minus the amount of any increase above or decrease below such charges exacted from the Gas Company by the Tennessee Gas Transmission Company for gas and gas service furnished hereunder. The amount of increase or decrease shall be determined by calculating the difference in the charges for gas and gas service furnished hereunder which are purchased by the Gas Company from Tennessee Gas Transmission Company under its 1947 charges applicable to sales within the State of Tennessee on file with the Federal Power Commission and any new authorized charges for such gas and gas service payable by the Gas Company to Tennessee Gas Transmission Company or any other supplier.

Mr. ELSTON. There is nothing ambiguous about that; is there?

Mr. WILLIAMS. We feel fairly safe for the first 3 years. We have a fairly sound contract. At the end of 3 years we can negotiate.

Mr. ELSTON. What assurance have you got that the rate cannot be increased immediately upon the beginning of this service?

Mr. PIKE. The Tennessee Gas Transmission Co., Mr. Elston, is engaged in interstate commerce, and its gas rates are, of course, regulated by the Federal Power Commission. I think we are in pretty good shape.

Mr. ELSTON. Here is a provision on your contract, the AEC contract, which Mr. Williams just read, and it very definitely and clearly provides that the supplier may increase the rate and pass it on to AEC.

Mr. PIKE. I believe it reads that the supplier may pass on to us either any increases or any decreases in what he has to pay to the primary supplier, which is the Tennessee Gas Transmission line.

Mr. ELSTON. That is right. Assuming they want to charge more, there is nothing in your contract that prevents them from doing it; is there?

Mr. PIKE. I would have to examine the contract again pretty thoroughly on that. I think there is, Mr. Elston.

(The following was later submitted for the record:)

Before the contract rates can be increased, approval of the Federal Power Commission must be obtained.

Mr. ELSTON. Did you understand the provision Mr. Williams just read?

Mr. PIKE. Yes; I think I do.

Mr. ELSTON. Is there any uncertainty in your mind after hearing it?

Mr. PIKE. Well, I am pretty clear that there is no opportunity for a gratuitous, frivolous increase in rate just because they want to increase the rate. This is a pretty strictly regulated industry.

Mr. ELSTON. I am not saying it could be frivolous. But suppose they offer substantial reasons to justify the rate. If they did, it could be passed on to AEC, and AEC would have to pay it.

Mr. PIKE. I think, if the cost went up to East Tennessee, we would have to pay the difference, just as we do in the case of coal when the costs go up. I think we are in better shape than in depending on the prices of coal.

Mr. ELSTON. They could also pass on increases in taxes; could they not?

Mr. PIKE. That is correct.

Mr. ELSTON. Read subsection 2, Mr. Williams, so that that will be in the record.

Senator HICKENLOOPER. While he is finding that, I wonder if Mr. Pike could tell me the present contract rate, how much it is per cubic foot.

Mr. PIKE. It is made of two parts, a so-called demand rate and a per foot rate. As we figured it, it ran from a maximum of about 22 cents a thousand down to a minimum of about 20 cents. As near as you could get.

Senator HICKENLOOPER. A thousand cubic feet?

Mr. PIKE. A thousand cubic feet at somewhere between a thousand and eleven hundred British thermal units per cubic foot.

Mr. WILLIAMS. Article IX, Charges To Be Paid by Government; Section 2, Commodity Charge and Payment:

(a) Commodity charge hereunder is 12.1 cents per thousand cubic feet. The Government shall pay the Gas Company, for each month of the calendar, a commodity payment in an amount equal to the commodity charge multiplied by the number of thousand cubic feet of natural gas actually received by the Government at all points of delivery during such month of the calendar or the commodity payment provided for in subparagraph (b) below, whichever is greater.

(b) Except as otherwise provided in this agreement, the Government shall pay the Gas Company, for each month of the calendar, a minimum commodity payment in an amount equal to the commodity charge multiplied by 40,000 M c. f. multiplied by the number of days in the month of the calendar. This monthly payment shall be made irrespective of the actual volume of gas deliveries. It is understood that said minimum commodity payment shall become applicable on the day of commencement of delivery of natural gas to the Government hereunder and shall cease to be applicable upon expiration or termination of this agreement. It is further understood that said payment shall be prorated, on the basis of the number of days in the months of the calendar involved for the months of commencement and expiration or termination if less than a full month of the calendar. If, subject to the allowable variations provided for in Article III, the Gas Company fails to deliver the volume of natural gas that the Government has given the Gas Company notice it desires to receive of less than 40,000 M c. f. on any day or days, then the charges set forth in the first sentence of this subparagraph (b) shall be reduced by an amount equal to the commodity charge multiplied by the volume of gas the Gas Company failed to deliver. Refusal by the Government to accept gas pursuant to the provisions of paragraph 1 or paragraph 3 of Article VI shall be deemed a failure to deliver within the meaning of this subparagraph (b).

(c) In the event the Commission estimates that the Government will not require the minimum of 40,000 M c. f. of natural gas on any future day or days, and the Commission notifies the Gas Company in writing, mailed at least ten days prior to the day or days referred to above, that on such day or days the Government will require such volume of natural gas less than 40,000 M c. f. per day, then the Gas Company will use due diligence to attempt to sell to others the volume of natural gas representing the difference between 40,000 M c. f. per day and the volume that the Commission specified. The Government would require on such day or days, *provided* such sale or sales shall not interfere with sales or prospective sales by the Gas Company to other customers (but the Gas Company shall not increase its demand requirements from its supplier after such notice from the Commission for the period of time specified therein) and, *provided further*, the Commission and the Gas Company agree upon the terms of such sale or sales and upon the credit to be derived therefrom by the Government. This credit shall apply only to the extent that the average volume of gas delivered by the Gas Company during a given month of the calendar shall be less than 40,000 M c. f. per day.

Mr. ELSTON. Did you have any more questions, Senator?

Senator HICKENLOOPER. No. The amount of gas, as I figure it, if they used a maximum of 60,000,000 feet a day, an increase of 5 cents, I believe, would be \$1,095,000 a year. If they used a minimum of 40,000, I have not figured that out yet.

Mr. ELSTON. I thought the figure of 10½ cents was much too high, but I believe it could be put in the record exactly the way you figure it.

Mr. PIKE. Yes, sir.

(The following was later submitted for the record:)

At 5-cents-per-1,000-cubic-feet increase for an average use of 60,000,000 cubic feet per day equals \$1,095,000 per year. A 5-cents-per-1,000-cubic-feet increase for average use of 40,000,000 cubic feet per day equals \$730,000 per year. A 5-cents-per-1,000-cubic feet increase is equivalent to a 41.3-percent increase in the commodity rate and does not appear within the realm of possibility.

Mr. ELSTON. Just another question or two, Mr. Pike.

Your contract, of course, was with the East Tennessee Natural Gas Co.

Mr. PIKE. Yes, sir.

Mr. ELSTON. That company does not of itself have any gas. They obtain it from others and simply transmit it to you?

Mr. PIKE. That is correct; yes, sir.

Mr. ELSTON. And most of the supply comes from down in Texas?

Mr. PIKE. Texas and Louisiana, yes, sir; mostly in Texas, I think.

Mr. ELSTON. So that the companies down there that do the supplying may have all sorts of labor trouble and other troubles that would prevent a delivery of gas.

Mr. PIKE. I expect they will have the same troubles that any business would have from time to time. They are not immune, but they are not particularly subject to labor troubles either, Mr. Elston.

Mr. ELSTON. But it is not confined to one company. It is confined to a number of supplying companies.

Mr. PIKE. I think that is correct. My memory is not completely clear. I do not think the Tennessee Gas Transmission owns directly much of its own supply. It contracts for it from producers there. Of course, in all this thing we are going at the protection of the completely independent source of supply at the lowest possible price to the Government. That is what we think we have got.

In having the two completely independent sources, naturally we think we are better off than depending heavily on any single source.

Mr. ELSTON. Now, of course, you realize that the supply of gas is quite limited. I believe it is estimated there is a 25- or 30-year supply.

Mr. PIKE. That is, I do not believe, quite accurate, Mr. Elston, in this: That if we knew where all the gas in the United States was, if we had it all discovered, that would be about it. There is about 30 years' supply of gas, known gas, in the United States, known and delimited.

We are, however, finding gas each year to the point that, to the best of my memory, there has been no year in the last 15 or 20 that there has not been more gas in sight at the end of the year than there was at the beginning, even allowing for all consumption.

Mr. ELSTON. But at the present time there is only a 30-year supply.

Mr. PIKE. That we can see.

Mr. ELSTON. As to coal, there is a supply that is almost inexhaustible.

Mr. PIKE. There is a lot of coal. Coal is such that we probably know about all our coal resources, but the supply of coal is for our purposes quite unlimited.

Mr. ELSTON. It would last hundreds of years?

Mr. PIKE. Yes, sir.

Mr. ELSTON. Now, on the matter of costs again—and I would like to get this in the record—as I understand it, the annual total cost of the gas would be about \$4,960,000 estimated, to include charges for depreciation and interest at 4 percent. Now, you can check these figures later and see if they are correct.

The coal would be \$5,650,000 on the basis of \$7.25 a ton.

The oil delivered price of 4 cents per gallon yields a figure comparable to coal.

Now, on the basis of those figures, an increase of 3 cents in the gas rate would wipe out the estimated saving given by AEC, but I wanted you to know where I got my figures and what my estimate was based upon, and I would like to ask you to check those figures and report later on.

Mr. PIKE. That should be very simple. The price you quote for oil, I think, is lower than any price we could reasonably expect to get. As to the other costs, I just will have to look at the figures.

(The following was later submitted for the record:)

Five million, six hundred and fifty thousand dollars of \$7.25 per ton coal would equal 780,000 tons of coal. An equivalent amount of gas per year at the contract rate would cost \$4,170,000. Depreciation and interest are not included because they are covered by the contract price for the gas. The contingent liability assumed by the AEC is covered by an obligation of \$4,400,000 of contract authority which will not be converted to cash unless the contract is canceled in less than 20 years. This contingent liability will reduce by one-twentieth each year gas is consumed at Oak Ridge.

As to the cost of oil, the price paid by Carbide & Carbon Chemicals Corp. for 1,500,000 gallons of bunker C fuel oil in October 1947 was 11.03 cents per gallon, f. o. b., Blair siding, which is equivalent to coal at \$18.20 per ton. Present price quoted on fuel oil is 7½ cents per gallon delivered in tank-car loads to Blair siding or 8 cents per gallon delivered to K-25 siding. This is equivalent to coal at \$13 per ton.

Mr. ELSTON. The other day I asked you about what action the Commission took with respect to the subcommittee report, which was approved by the full committee, and you said there was some discussion about it.

Mr. PIKE. I have checked my memory since, Mr. Elston. We had in preparation a letter to the committee asking for a discussion with the full committee on the subject. I think that letter came up to the Commission last Monday, and, I believe, needed some revision. But as soon as we heard from the committee, we felt that our original decision was really in accordance with the facts and we wanted to discuss it with the committee. It has happened, I suspect, probably—we have been pretty busy the last several weeks, and I do not know whether that letter has been sent, frankly.

Mr. ELSTON. So we have not even as yet gotten the letter.

Mr. PIKE. That I do not know. I would have to check. That is an easy factual matter to find out.

Mr. COLE. May I interrupt to inquire: What was the purpose of the letter?

Mr. PIKE. The purpose of the letter, as I remember it, was to ask if we could have the opportunity of discussing with the full committee this whole situation, because we felt, at least I felt, that the committee in adopting the report of the subcommittee had not given enough weight to several facts that weighed very heavily with us.

Mr. COLE. What would be the purpose of a conference with this committee, since the Commission had already decided to go ahead with the project in spite of the report of the committee?

Mr. PIKE. You see, we were already going ahead with the project before the subcommittee report was made known to us. We felt that we had sound reason for feeling it should be continued, and we wanted to lay the facts before you and we thought you probably would agree with us when you saw the problem we had and the way we were trying to solve it.

Mr. COLE. Announcement was made on June 2 that the construction of the project was going to go forward in spite of the report of this committee, which was made on May 27, an interval of working days of only 2 or 3 days.

Mr. PIKE. I think that was about when the pipe was delivered. I do not believe we made that announcement.

Mr. COLE. The announcement came from the gas pipe-line contractor. That announcement must have been made after consultation with the other party to the contract, in other words, the Commission.

Mr. PIKE. That I do not know, Mr. Cole.

Mr. COLE. I fail to understand what would be the basis of any conference with this committee in view of the fact that the Commission had apparently decided to go ahead irrespective of this report.

Mr. PIKE. You might have said——

Mr. COLE. I want to emphasize that this committee did not recommend against building the line, did not report adversely. It simply said that the basis upon which the Commission reached a determination to build the line was unfounded.

Mr. PIKE. Of course, that is where we disagree.

Mr. COLE. Those are the bases which in your opinion are trivial.

Mr. PIKE. I still do not think they are as good as the bases on which we are going ahead and building it.

Mr. COLE. It is understandable that since the report lay on the desk for only 2 or 3 days before announcement was made that the Commission was going ahead with the construction of the line, irrespective of this committee's attitude, it is understandable why you would characterize the report as being trivial.

Is it not a fact that this is the first report this committee has ever sent to the Commission on any of its projects, on any of its operations?

Mr. PIKE. I do not think so, Mr. Cole. There was a subcommittee report on Du Page, one on Los Alamos, one on Oak Ridge housing. I think my memory is correct on those. There may be some others.

Mr. COLE. Does your memory serve you well enough to tell me what reaction the Commission had with respect to those reports?

Mr. PIKE. They were very helpful reports, very helpful reports.

Mr. COLE. Those were all subcommittee reports, however.

Mr. PIKE. Yes, sir. You mean from the whole committee?

Mr. COLE. This is the first report from the full committee, is my understanding.

Mr. PIKE. I think that is probably right.

Mr. ELSTON. Mr. Pike, was the action of the Commission reflected in your minutes?

Mr. PIKE. I think so; yes sir.

Mr. ELSTON. Can you produce the minutes?

Mr. PIKE. I do not have them; no, sir.

Mr. ELSTON. Will you produce those minutes and read them into the record, showing what action the Commission took on the report of this committee and when it was done?

Mr. PIKE. I will have to look and see; yes, sir. I will have to give that.

Mr. ELSTON. Now, there is a motion for a rehearing pending before the Federal Power Commission, is there not?

Mr. PIKE. I do not know, sir.

Mr. ELSTON. Do you know, Mr. Volpe?

Mr. VOLPE. I have not heard about it, Mr. Elston.

Mr. ELSTON. I think you will find there is a motion for a rehearing pending before the Commission.

Mr. VOLPE. On whose part, Mr. Elston?

Mr. ELSTON. I do not know who filed it, but I was informed there was such a motion pending. Of course, it would follow as a matter of course, since your contract is contingent upon approval by the Federal Power Commission, that if the motion for rehearing were granted, you would be relieved of all obligations under your contract. That is correct, is it not, as a matter of law?

Mr. VOLPE. Under the contract, Mr. Elston, the contract is made subject to the issuance of a certificate by the Federal Power Commission. The Federal Power Commission has issued a certificate. Now, I have not heard about a motion to reopen.

Mr. ELSTON. Well, if a certificate were issued and a motion were pending for a rehearing, and on rehearing they did decide not to grant the certificate, the Commission would be relieved of legal responsibility under the contract.

Mr. VOLPE. That is correct, sir.

Mr. ELSTON. You have not considered, not even knowing about the motion, the matter of holding up the contract until this committee had the opportunity to respond to the letter which you say is coming to us.

Mr. VOLPE. Mr. Elston, perhaps I can help clarify that a bit. When we received the subcommittee report, inquiries were made by the press and the Commission as to what action the Commission would take upon the subcommittee report. I do not recall the date offhand, but I believe it was shortly after the report was issued.

The Commission announced that it had received the report and was giving the report careful consideration. No action was taken by the Commission to suspend work.

A reason for that is the fact that a good deal of work had already gone on over the period of the last year and a half or so. The East Tennessee Co. had acquired a substantial amount of steel, they had made many arrangements for financing, and they were moving ahead, in other words, in a very substantial way to get in this line.

After the report was received and it was in the midst of these various hearings, the Commission asked the Director of Production to prepare a report to the Commission on the subcommittee report and to report to the Commission whether or not, in the view of the Production Division, there had been a change in circumstances or whether there had been overlooked certain matters which should in the view of the Director of Production require a change in what the Commission had done.

A meeting of the Commission was held last week, I believe, or it may even have been the week before—so many things have been happening that I am kind of faulty as to dates—and the Commission discussed this problem quite thoroughly. The Commission came to the view that there was not, in their view, any reason for changing their initial decision.

However, they did express a good deal of—I was going to say concern, but perhaps “concern” is not the right word—but they did express a good deal of interest in the subcommittee report, and the question was what to do about it.

The Commission suggested that a letter be drafted to be forwarded to the joint committee, asking the full committee for an opportunity to discuss the problem. I mention this, Mr. Elston, only to point out that the report was considered very seriously. The report was given a good deal of attention.

The fact that no action was taken to stop the work was only because a great deal of work had already been done over the past year and a half.

Mr. ELSTON. Mr. Volpe, you know that if the East Tennessee Gas Co. assumed any obligations at all or did any work over the last year and a half, it was all contingent upon getting a certificate from the Federal Power Commission to go ahead.

Mr. VOLPE. That is right, sir.

Mr. ELSTON. And they were not obligated to perform one single provision of their contract until that certificate was granted.

Mr. VOLPE. That is right.

Mr. ELSTON. And that certificate was not granted until what date?

Mr. VOLPE. I believe June 3.

Mr. ELSTON. June 3, which was just about the time——

Mr. VOLPE. I am not sure whether it was June 3 or May 3, but I believe it was the day after your subcommittee started hearings that the Federal Power Commission issued a certificate. I believe it was May 3, Mr. Elston.

Mr. ELSTON. All right.

Mr. VOLPE. Mr. Elston, you asked questions about what action the Commission took to clear this matter of natural gas with other agencies of Government who were concerned with this matter. I would like to tell you just briefly what was done.

The Commerce Department, under the law, has responsibility for allocation of steel. In connection with the allocation of steel for the natural gas line, there were very extensive discussions with the Commerce Department and, as a matter of fact, if my memory serves me right, there was also some discussion of taking the matter up with the National Security Resources Board. But this again, if my memory serves me right, was the responsibility of the Department of Commerce, because they had to make an allocation here.

In addition to the Department of Commerce, we also discussed this with the Bureau of Mines, and the reason we discussed it with the Bureau of Mines was at the time there was an Executive order directing the Bureau of Mines to coordinate among Government agencies the use of oil and natural gas in certain localities in the country. Under this Executive order we were required to coordinate this matter with the Bureau of Mines, and this we did.

Mr. ELSTON. You do not know that the Commerce Department took it up with the National Security Resources Board; do you?

Mr. VOLPE. I do not know whether they did or not.

Mr. ELSTON. For all you know, they may have anticipated that you would do it.

Mr. VOLPE. I do not believe that is right, Mr. Elston, because my recollection is that they felt it was their responsibility to do that.

Senator HICKENLOOPER. Mr. Chairman, I would like to ask is there not a record some place? Do we have to go on uncertain recollection here on a suggestion of that kind? Can we not be more specific about whether these things were actually done?

Mr. VOLPE. Senator Hickenlooper, the discussion with the Department of Commerce on allocation was definitely done. The conferences with the Bureau of Mines were definitely done. As to whether or not the Department of Commerce in carrying out their responsibility

discussed this matter with the National Security Resources Board, this would have to be determined from the Department of Commerce.

The CHAIRMAN. Mr. Hinshaw?

Mr. HINSHAW. Mr. Chairman, for the purpose of the record I would like to get some figures from one of the gentlemen here and some facts.

First, who operates the K-25 steam plant, the AEC or Carbide?

Mr. WILLIAMS. Carbide & Carbon Chemicals Co.

Mr. HINSHAW. Do you supply the fuel?

Mr. WILLIAMS. The Carbide & Carbon Chemicals Co. obtains bids for the fuel. Of course, we reimburse them for the payment.

Mr. HINSHAW. But they are the ones who actually conduct the negotiations?

Mr. WILLIAMS. Yes, sir.

(The following was later submitted for the record:)

Carbide & Carbon Chemicals Co. do obtain bids for coal and oil and of course the AEC reimburses them for the payment. However, the natural gas contract is a prime AEC contract and the procurement of gas is a direct AEC function.

Mr. HINSHAW. What is the capacity of the K-25 steam plant?

Mr. WILLIAMS. About 238,000 kilowatts.

Mr. HINSHAW. And how many units are there?

Mr. WILLIAMS. As I recall, 14.

Mr. HINSHAW. That is 14 boilers or 14 generators?

Mr. WILLIAMS. Fourteen generators.

Mr. HINSHAW. Is the capacity equally divided among the 14?

Mr. WILLIAMS. No; it is not.

Mr. HINSHAW. What is the capacity of each?

Mr. WILLIAMS. I could furnish you that. I do not know if I have it here. I am quite certain I do not have it here.

Mr. HINSHAW. Please furnish it for the record.

(The following was later submitted for the record:)

Number	Size	Total capacity
	<i>Kilowatts</i>	<i>Kilowatts</i>
1	35,000	35,000
6	25,000	150,000
1	20,000	20,000
1	12,500	12,500
1	10,000	10,000
3	3,000	9,000
1	1,500	1,500
Total		238,000

What is the fuel consumption of the K-25 plant at normal load?

Mr. WILLIAMS. We average on three-boiler operation approximately 16,000 tons a week.

Mr. HINSHAW. That is 64,000 or 65,000 tons a month?

Mr. WILLIAMS. That is  $4\frac{1}{3}$  times 16, which would be roughly 68.

Mr. HINSHAW. 68,000 tons. What is the generating cost per kilowatt-hour?

Mr. WILLIAMS. As I recall, it runs about 5 cents.

Mr. HINSHAW. Not 5 cents.

Mr. WILLIAMS. Five mills.

Mr. HINSHAW. That is better. Does that include depreciation?

Mr. WILLIAMS. No; that does not include depreciation. That includes the cost of fuel and all of the charges of the operation of the plant, handling of the fuel, freight, everything that is connected with the operation of the plant.

Mr. HINSHAW. It does not include any interest on the investment either?

Mr. WILLIAMS. No interest on the investment.

Mr. HINSHAW. And, of course, it does not include any taxes.

Mr. WILLIAMS. No taxes.

Mr. HINSHAW. 68,000 tons per month provides what constant load?

Mr. WILLIAMS. I would have to furnish you those figures. I can tell you the capacity of the boilers—750,000 pounds per hour of steam. That is per boiler, and there are three boilers. The load varies somewhat with the condition.

Mr. HINSHAW. Could you estimate what load 68,000 tons per month would provide?

Mr. WILLIAMS. Well, if you wanted to use all the steam for power generation, you could run all your turbines.

Mr. HINSHAW. Will you supply that figure for the record?

Mr. WILLIAMS. Yes, sir.

(The following was later submitted for the record:)

Average is approximately 183,000 kilowatts net or 198,000 kilowatts gross; 15,000 kilowatts is required for operation of power-plant auxiliaries.

Mr. HINSHAW. Now, I presume that that load is divided between the AEC load, the community facilities load, and at times the TVA load; is that not correct?

Mr. WILLIAMS. The load at the power plant?

Mr. HINSHAW. Yes.

Mr. WILLIAMS. The power plant; generally we consider it just for the plant. It has a possibility of interconnecting with the TVA system of a portion of the plant, but it is used primarily for the K-25. In fact, I think it is used completely for the K-25 plant.

Mr. HINSHAW. But you do sell power to the TVA; do you not?

Mr. WILLIAMS. We generate power at low water to help the TVA. That is, they have a contract with us to furnish, I believe it is 225,000 kilowatts, something like that, and any power that we generate would help their system in times of emergency.

Now, when we generate power to help their load conditions, they pay us for the cost of the generation.

Mr. HINSHAW. You mean they pay you 5 mills?

Mr. WILLIAMS. I would have to check that exactly. It is my understanding that they pay the increment of costs between what we pay them and what it costs us to generate. I would have to check that exactly.

Mr. HINSHAW. Would you put that figure in the record, please, because I think it is important.

(The following was later submitted for the record:)

TVA credits the AEC account with approximately 3.9 mills per kilowatt-hour for power furnished by AEC. This is approximately 0.43 mills more than AEC pays TVA each kilowatt-hour purchased from them.

Now, may I ask: During this period of August 1946 to August 1947, when you were overdrawing your coal stock pile in the AEC yard by 10,000 tons a month, were you delivering power to the TVA?

Mr. WILLIAMS. We were generating power at that time to about capacity, not essentially for the TVA, but due to the low water in the dams of the TVA system in order to keep the plant running and in order for TVA to balance their load it was necessary that we run our generators.

(The following was later submitted for the record:)

During the period of August 1946 to August 1947, AEC furnished power back to TVA for only a portion of 2 months. These were as follows: July 1947, 30,000 kilowatts or 12,213,000 kilowatt-hours; August 1947, 55,200 kilowatts or 38,411,000 kilowatt-hours.

Mr. HINSHAW. Would you place in the record the kilowatt demand or the average demand being furnished to the TVA during that period of August 1946 to August 1947?

You say that is on the basis of sale to the TVA and you are going to put the basis of that sale into the record, I take it.

Mr. WILLIAMS. Yes, sir.

(The following was later submitted for the record:)

The average being generated for the account of TVA during the 13-month period August 1946 through August 1947 was approximately 5,200 kilowatts.

Mr. HINSHAW. Do you have an arrangement for the purchase of TVA power?

Mr. WILLIAMS. We have a contract for the purchase of power from TVA; yes, sir.

Mr. HINSHAW. At what rate do you purchase it?

Mr. WILLIAMS. As I recall, about  $3\frac{1}{2}$  mills.

Mr. HINSHAW. Would you check that figure and be sure that it is accurate in the record, please?

(The following was later submitted for the record:)

AEC's purchases from TVA are on the basis of \$1 per kilowatt-hour per month for maximum demand during the month and 2.0 mills per kilowatt-hour for power used during the month. Average experience for recent typical months is as follows:

March 1949—3.465 per kilowatt-hour.

April 1949—3.497 per kilowatt-hour.

May 1949—3.465 per kilowatt-hour.

Mr. HINSHAW. There is no basis of exchange of power between the K-25 steam plant and the TVA; is there? Do you exchange kilowatt-hour for kilowatt-hour, or do you charge both ways?

Mr. WILLIAMS. We charge both ways, as I recall, sir. I might point out also, because there might be a misconception on the part of someone reading this record, that it would be possible for us to buy all of our power from TVA, since it is cheaper, and that is not the case, as I believe this committee is aware.

Mr. HINSHAW. Three and one-half mills is obviously cheaper than your generating cost if your generating cost is 5 mills.

Mr. WILLIAMS. Yes, sir; and there would have to be a reason why we generate any at all, and there is a good reason, and I believe this committee is fully informed on that reason.

Mr. HINSHAW. Now, I would like to know from the Commission or from its representatives as to whether or not this 10,000 tons per month during August 1946 to August 1947 period was drawn down for the benefit of firming up TVA power, or furnishing power to TVA, or whether it was required by the AEC itself.

Mr. PIKE. I think, Mr. Hinshaw, although again we should go to the record on that to be exact, I think we were buying power from TVA on a net balance all the time during this period, but when we could get a little bit more out of that power plant, it could be used in such a way as to take part of the load off them. We were still buying power from TVA net all the time.

Mr. HINSHAW. You were buying power net?

Mr. PIKE. Yes, sir.

Mr. HINSHAW. You say you bought a million and a half gallons of fuel oil at 10.31 cents per gallon during that period; is that correct?

Mr. WILLIAMS. That was the price quoted. I would have to check the record to be sure that is what we paid for every gallon. I believe that is right.

(The following was later submitted for the record:)

Carbide purchased, in October 1947, 1,500,000 gallons of No. 6 bunker C fuel oil from the Ashland Oil & Refining Co. for 11.03 cents per gallon, f. o. b., Blair Siding, which is 14 miles north of the K-25 power plant.

Mr. HINSHAW. Did you buy a million and one-half gallons, or did you buy more than a million and a half gallons?

Mr. WILLIAMS. As I recall, we bought 1,500,000 gallons. We had some fuel oil that had been left over from another operation.

Mr. HINSHAW. It is my understanding that in Washington during that same period fuel oil was being sold to domestic consumers at about 6 cents a gallon.

Mr. PIKE. I do not think that is true, not at that time.

The CHAIRMAN. I wish that were so.

Mr. HINSHAW. I guess I mean 10,000 gallon lots, barrel lots, tank-car lots.

The CHAIRMAN. When was that, Mr. Hinshaw?

Mr. HINSHAW. August 1946 and 1947. At the present time it is my understanding that bunker C is at the rate of 4 cents a gallon in 10,000 gallon lots in Washington.

Mr. PIKE. There has been a sharp decrease in bunker C in the last 5 or 6 months. There are two things. Of course, from August 1946 to August 1947, a real shortage was developing all through the oil area, and there were several very sharp increases, as you probably remember, in the price of oil. I think you would have to work out an average for the period. When you come to a place very close to water transportation on the Atlantic coast, you are apt to get better prices for fuel oil than at an inland point.

Mr. HINSHAW. You do not mean to say they do not have water transportation to Oak Ridge, do you?

Mr. PIKE. I would not call it the cheapest kind of water transportation, although I wish I was more of an expert on it.

Mr. HINSHAW. It is inland waterway transportation?

Mr. PIKE. Yes, sir.

Mr. HINSHAW. And I just want to say for the record that my information is that Bunker C during 1946-47 was \$2.45 per barrel, or 6 cents a gallon in Washington.

Mr. PIKE. That sounds about right.

Mr. HINSHAW. So that you were overcharged some 4.3 cents per gallon for the fuel.

Mr. PIKE. We would have to look back on the record to make it clear on that, but oil was in extreme shortage, as you will remember, particularly the latter part of that period.

Mr. HINSHAW. It would seem to me that the cost of transportation by inland waterway to Oak Ridge would hardly be any more than the cost of the ocean-borne transportation.

Mr. PIKE. That would be a matter of checking rates, but I suspect it would be much higher inland.

Mr. HINSHAW. On inland water?

Mr. PIKE. Yes, sir.

Mr. HINSHAW. I wish you would check the rates by inland waterway to Oak Ridge.

(The following was later submitted for the record:)

Since there is no barge line operating to Oak Ridge there are no published inland-waterway rates. However, quotations have been received from the A. L. Meckling Barge Line of Joliet, Ill., on the shipment of Grade 6 bunker oil from Memphis, Tenn., to Oak Ridge. The quoted rate was \$2.80 per ton river-freight which is equivalent to 1 cent per gallon, f. o. b. barges, Oak Ridge. Bunker C oil has been quoted at 4.14 cents per gallon at Memphis. Thus the delivered price to Oak Ridge is 5.14 cents per gallon. This is equivalent to \$8.40 per ton coal.

Mr. PIKE. That is quite a long way from any refinery; whereas, from here you have refineries all along the coast.

Mr. HINSHAW. Where did the 172 miles of East Tennessee Gas Co. pipe line cut into the main line of Tennessee Gas Transmission Co.?

Mr. WILLIAMS. As I recall, it is near Mitchellville, Tenn.

Mr. HINSHAW. Does this East Tennessee Natural Gas Co. have another application in for a pipe line?

Mr. WILLIAMS. I do not know.

Mr. PIKE. I think it does, Mr. Hinshaw.

Mr. HINSHAW. I believe it does, to furnish Knoxville, Tenn., and intervening cities.

Mr. PIKE. That is my understanding.

Mr. HINSHAW. Has a permit been granted yet for that line, do you know?

Mr. PIKE. I do not know.

Mr. HINSHAW. Has the East Tennessee Natural Gas Co. heretofore engaged in any sales of natural gas?

Mr. PIKE. I believe this is a fairly newly formed corporation.

Mr. HINSHAW. Now, the Tennessee Gas Transmission Co. owns the main line of transmission, does it not?

Mr. PIKE. That is correct, sir.

Mr. HINSHAW. What does it propose to do in order to furnish this additional gas to the East Tennessee Natural Gas Co.?

Mr. PIKE. They are laying additional pipe, and I think they have plans as far as 18 months or 2 years ahead. They have plenty of supplies in the field, and they are putting additional pipe in about as fast as they can get it to bring more gas up here.

My memory is that it is part of the additional gas which they can transport that we are going to get for this pipe line.

Mr. HINSHAW. Is it correct to state that the Tennessee Gas Transmission Co. will spend \$13,350,000 to expand its trunk line facilities from Texas to Tennessee?

Mr. PIKE. I would think they would probably spend a good deal more than that. They have a very large expansion program under way.

Mr. HINSHAW. Then, in addition, there is the approximately \$9,400,000 to build a 22-inch line 172 miles from Tennessee Gas Transmission trunk line to Oak Ridge, is there not?

Mr. PIKE. I believe that is about the cost.

Mr. HINSHAW. And your fiscal year 1950 budget provides the following figures, as I have them:

Oak Ridge municipal gas system, \$2,470,000; is that correct?

Mr. PIKE. That is my memory, yes, sir.

Mr. HINSHAW. And the gas heaters in all town buildings in Oak Ridge, \$2,350,000.

Mr. PIKE. I do not remember that one.

Mr. HINSHAW. Gas pipe lines to supply production plant, \$430,000; and to convert the K-25 boiler plant to gas, \$260,000.

To convert the boiler plant No. 2 to gas, \$100,000.

There is an estimated net cost to the AEC to convert to gas of \$5,610,000. Is that correct?

Mr. PIKE. I see what you mean now. That proposal to put gas in the town is a pretty different thing from what we have been talking about, and I can see where all of them put together would add up.

Mr. HINSHAW. It was in your fiscal year 1950 budget.

Mr. PIKE. I think we proposed to do that.

Mr. HINSHAW. So that is additional cost.

Mr. PIKE. And an additional saving, incidentally. It would be a tremendous saving to get natural gas in the housing there. As I remember it, coal delivered to the houses cost us the equivalent of nearly twice what it does in the cars there. I think it costs \$13 or \$14 a ton when it gets to the houses and then, of course, we have the ash disposal problem, too.

But they are rather different. As I remember it, we figured we would save three or four hundred thousand dollars a year on the domestic operation. This is in addition. This is a rather different thing from the thing we have been talking about here.

Mr. HINSHAW. In answer to a question by Mr. Elston a few moments ago, you mentioned \$260,000 would convert the K-25 boiler plant to gas, but failed to mention the other item in the fiscal year 1950 budget.

Mr. PIKE. I did not quite understand the question, and I am sorry, Mr. Elston, that I did not realize you were bringing in the proposal to pipe gas through the town.

Mr. HINSHAW. You state that the additional investment in doubling the stock pile of coal in Oak Ridge would be about  $1\frac{1}{2}$  million dollars; is that correct?

Mr. PIKE. In that neighborhood. We figure 200,000 tons at around \$7.

Mr. HINSHAW. So that the additional investment required to convert Oak Ridge to gas is \$4,000,000 in excess thereof, at least.

Mr. PIKE. If you bring in the domestic side of it. This is the first time it has been brought up.

Mr. HINSHAW. That is contained in the budget, so we were interested in finding out.

Mr. PIKE. Yes.

Mr. HINSHAW. Now, the East Tennessee Natural Gas Co. owns no gas wells at all, does it?

Mr. PIKE. I am sure it does not.

Mr. HINSHAW. Does the Tennessee Gas Transmission Co. own its wells or does it purchase?

Mr. PIKE. I think it purchases. I remember when that thing was started, the same group of people apparently were starting the pipe line and owned some very large gas-producing areas in Texas. My memory is that in the very early days of that line ownership of the gas properties was split from that of the pipe line, and I expect they are not in common any more.

Mr. HINSHAW. You mean the same owners own the well as own the transmission lines, but they are split from it?

Mr. PIKE. My memory is they owned or controlled these gas fields when they started to put the line in, and I suspect for legal reasons they did split ownership. I am sure, of course, that the areas from which the Tennessee Gas now gets its supplies are very much more extensive than those gas lines which the original promoters owned.

Mr. HINSHAW. Does the East Tennessee Natural Gas Co. have the right to reduce the delivery of gas from 60,000,000 cubic feet per day to 40,000,000 cubic feet per day?

Mr. PIKE. I do not think so.

Mr. HINSHAW. Must they furnish you the full demand?

Mr. PIKE. I believe 60,000,000, they are on the line. I think we have the privilege to go to 40.

(The following was later submitted for the record:)

The East Tennessee Natural Gas Co. is required to supply firm supply of 60,000,000 cubic feet per day. The Commission has the privilege of going down to 40,000,000 cubic feet per day.

Mr. HINSHAW. Is 60,000,000 cubic feet per day sufficient to sustain the 238,000-kilowatt capacity of the Oak Ridge plant?

Mr. PIKE. I think so, but I think Mr. Williams' answer would be more first-hand.

Mr. WILLIAMS. That is our estimate: that that amount of gas would completely replace the coal which we have been using at the power plant.

Mr. HINSHAW. Now, do you propose to furnish power from this source to the TVA after the pipe line is put in?

Mr. WILLIAMS. If it were necessary to use our boilers and our generators to assure the continuous production of K-25, we would.

Mr. HINSHAW. I do not get that clear at all. What your main job is is furnishing production to the K-25 plant. What has the TVA got to do with it?

Mr. WILLIAMS. We have a contract with the TVA to furnish a certain block of power.

Mr. HINSHAW. That is what I want to get at. What is that block of power?

Mr. WILLIAMS. As I recall, it was 225,000 kilowatts.

Mr. HINSHAW. You said a while ago that the capacity of your plant was 238,000 kilowatts.

Mr. WILLIAMS. That is what the TVA furnishes us, 225,000 kilowatts.

Mr. HINSHAW. When I asked you the question, what is the capacity of the K-25 steam plant, you answered 238,000 kilowatts.

Mr. WILLIAMS. That is approximately correct. It is either 232 or 238. I would have to add up the capacities of all generators, but

that is our generating plant, and that is the capacity which that plant has.

As to the TVA, we have a contract with the TVA to furnish us, in addition to our own generation, I think it is 225,000 kilowatts. I have to check the contract.

Mr. HINSHAW. The TVA furnishes you. I was asking you about your furnishing TVA.

Mr. WILLIAMS. I said I did not know, sir, the exact amount of power we furnish them. I will have to check the records.

(The following was later supplied for the record:)

The maximum rate at which AEC has furnished power to TVA has been 55,800 kilowatts which was furnished in December 1947. This is considerably less than the amount of power being purchased from TVA at the same time and it in effect only reduces the amount of electric power TVA would otherwise be obligated to furnish under their contract demand. The cost of generating power for the TVA account at the K-25 steam plant is slightly higher than the average price AEC pays TVA for power. That is because of the fact that most of the TVA power is hydroelectric which is less costly to generate. TVA therefore pays AEC the incremental cost for any power generated for their account and AEC continues to buy from TVA at the rate stipulated in the contract. There are definite advantages to both agencies in this arrangement.

Advantages to AEC are:

(a) The optimum amount of special-process power required by the gaseous diffusion plant is slightly more than the capacity of the two boilers in the K-25 steam plant but less than the capacity of three boilers. Whenever all three boilers are available for use it is more economical to operate all three of them if TVA is willing and able to take the excess power at the incremental cost of producing it.

(b) It takes approximately 8 hours to start up another boiler so with the three boilers on the line there is more control for the stabilized operation of the gaseous diffusion plant since the TVA load can be dropped at any time that our power plant equipment must be shut down.

Advantage to TVA is that the electrical power demand in the Tennessee Valley exceeds the available capacity and any excess generation that we can supply can be used by TVA particularly at a time when their water reservoirs are low.

Mr. HINSHAW. Mr. Chairman, when I visited the K-25 steam plant a year ago, they were furnishing 50,000 kilowatts to the TVA, according to the statement of the manager and that, of course, is quite a sizeable chunk out of the 238,000.

Mr. WILLIAMS. At one time we were furnishing that much. I remember that figure.

Mr. HINSHAW. Mr. Chairman, I think it would be important to know what the average demand furnished to the TVA during that period of 1946-47 and 1947-48 has been on a monthly basis in order that we may understand who is furnishing power to whom and how much.

(The following was later submitted for the record:)

During 1947 AEC furnished TVA power in the following amounts:

	Kilowatts	Kilowatt-hours
January through June: No power furnished TVA.		
July.....	30,600	12,213,000
August.....	55,200	36,411,000
September.....	55,200	22,011,000
October.....	55,200	1 24,621,000
November.....	53,400	1 39,267,000
December.....	55,800	1 40,718,000

<sup>1</sup> TVA furnished coal during these months.

During 1948 AEC furnished TVA power in the following amounts :

	Kilowatts	Kilowatt-hours
January.....	54,600	<sup>1</sup> 30,230,000
February.....	55,200	34,048,000
March.....	None	-----
April.....	None	-----
May.....	None	-----
June.....	48,000	17,431,000
July.....	54,000	29,113,000
August.....	25,000	8,488,000
September.....	27,000	19,490,000
October.....	27,000	325,000
November.....	27,000	16,054,000
December.....	27,000	16,882,000

<sup>1</sup> TVA furnished part of coal during this month.

NOTE.—During the period July 1947 through February 1948, because of extremely low water levels in the reservoirs, TVA desired that the K-25 power plant be operated at full capacity in order to relieve TVA of the need for furnishing part (approximately 55,000 kilowatts) of the firm supply of 225,000 kilowatts they are required to furnish Oak Ridge under their contract.

Previous arrangements whereby TVA and Carbide did not compete with each other for the purchase of coal were amended so that Carbide could purchase coal for the additional generation from dealers in western Kentucky who had previously supplied TVA but not Carbide. This arrangement helped some but did not prove adequate and on September 11, 1947, TVA was notified that because of the shortage of coal it would be necessary to discontinue the operation of the third boiler on September 18, 1947, at 9 a. m.

The TVA water situation did not improve and an understanding was reached on October 9, 1947, whereby the third boiler would be started again with coal for its use to be furnished by TVA by truck to the K-25 power plant. This arrangement was continued until early in January 1948 when the size of the K-25 stock of coal became adequate and truck delivery of coal by TVA was discontinued.

It is further suggested that the remarks "TVA furnished coal" be added opposite the months of October, November, December 1947, and the notation "TVA furnished part of coal" be added opposite January 1948.

Mr. PIKE. During all this period, Mr. Hinshaw, it is very clear that they were furnishing us net power. Here is the situation as I see it:

We have three boilers there. When normal operation takes about two boilers and because we have to arrange for periodical maintenance work, we figure one boiler out of commission a good deal of the time. Now, there are times of the year when you can run three boilers maybe for 2 or 3 months at a time. During those periods, particularly when the TVA is short of power, we can run the whole thing all out and take the load off them somewhat, but even when we are furnishing them some power, they are still furnishing us a lot more power, so that they are always supplying us net. It merely takes some of the load off their back when all our equipment can run.

Mr. HINSHAW. You mean to say that you furnish TVA—you furnish to the TVA at the same time they furnish power to you?

Mr. PIKE. I think that is right. I think that is the way the transmission lines are set up. We can pump a little back into their lines and take the load off them some.

Mr. HINSHAW. That is a curious arrangement to me.

Mr. PIKE. That is quite a usual arrangement.

Mr. HINSHAW. To transmit power from one power company to another, when the demands upon the power at the local source are greater than the supply available? I just do not understand it, but then perhaps it can be explained.

Mr. WILLIAMS. Mr. Congressman, I think it would be hard to determine whether the electricity we generate goes back to TVA or goes over to the K-25 plant. It is fed into the distribution system, and it is merely running our plant to help out the total picture, the over-all load picture, in that particular region.

Mr. HINSHAW. What is the total generating capacity of the TVA?

Mr. WILLIAMS. That I do not know.

Mr. HINSHAW. I am sure Mr. Lilienthal would know. He managed it for a great many years. I wonder if he could answer what the total capacity of TVA is.

Mr. LILIENTHAL. I am retired from that business, but my recollection is it is in excess of 2,000,000 kilowatts, but I do not know the up-to-date figures.

Mr. HINSHAW. So that the demand of the AEC would constitute about 10 percent of the total generating capacity of the TVA.

Mr. LILIENTHAL. No; I think that is oversimplifying it. You ought to get an electrical engineer to explain the relation between this installed capacity and the demand used. It is more complicated than that. We have got some around here.

Mr. HINSHAW. I would like to ask you why the TVA is not the best alternate source of power in the interest of national security?

Mr. WILLIAMS. You mean to replace—well, the answer is, we use TVA to the extent possible, but there is still a block of power which we have to generate, and I believe this committee is familiar with the reason for the generation, and that we have to continue to generate. We cannot buy it from TVA.

Mr. HINSHAW. I believe I understand that will not require a further answer. Nevertheless, TVA through converters could be used; could it not?

Mr. WILLIAMS. We looked into that. I cannot speak personally, because that happened before I came to the project, but I understand it was investigated earlier and it was found that it was quite costly and might not prove fully reliable.

Mr. HINSHAW. Are you aware of the installation of Johnsonville steam plant in the TVA?

Mr. WILLIAMS. Yes, sir; I am aware that there is a plant and that they did get some money. That is about the extent of my awareness.

Mr. HINSHAW. Do you happen to know that the distance from the Johnsonville plant site to the Tennessee Gas transmission line is 12 miles?

Mr. WILLIAMS. I do not.

Mr. HINSHAW. An examination of this map will indicate to you the location of the Johnsonville steam plant, which is approximately, as I gathered, about 12 miles, as it appeared to be on the map, from the Tennessee Gas transmission lines.

Mr. WILLIAMS. That would not meet our requirement, even if they had a gas line over there. We still require generation in our own power plant, even though the TVA were assured of all the generating capacity possible.

Mr. HINSHAW. That is not the purpose of my question.

Mr. WILLIAMS. Maybe I was anticipating it.

Mr. HINSHAW. I will arrive at the purpose of my question now. It is my understanding the the Johnsonville steam plant is to use coal. Do you know whether that is correct or not?

Mr. WILLIAMS. I have heard that is true.

Mr. HINSHAW. They are 12 miles from the Tennessee Natural Gas transmission lines.

Mr. WILLIAMS. I have heard that is true.

Mr. HINSHAW. I wonder why they would use coal if gas was found to be so much cheaper.

Mr. WILLIAMS. That I do not know.

Mr. HINSHAW. Do you not think it might be worth investigating from the Commission standpoint? The Commission makes the claim that gas is so much cheaper, and yet the Johnsonville steam plant, 12 miles off the transmission line, not 172 miles, is going to use coal.

Mr. WILLIAMS. I have an idea that at the time—this plant has probably been under consideration for some time—and at the time it was designed and plans made, I have an idea that there was a freeze order on gas and oil and so on. It has probably been under consideration for some time.

I do not know the reasons for using coal. It was probably the same reason they used coal in the K-25 plant in the beginning—that there was coal available.

But the Johnsonville steam plant is probably being put in to firm up hydroelectric power, and I do not know how continuous the operation will have to be. There are a lot of factors that have to come into this in order to get a complete picture.

Mr. HINSHAW. I may say to you that during the debates on the question of the Johnsonville steam plant on the floor of the House of Representatives it was pointed out that owing to the special requirements of the AEC, the Johnsonville plant was a very great necessity, and that was the reason for the building—that was a strong reason for building the Johnsonville steam plant.

Mr. WILLIAMS. We do plan to get additional power from the TVA.

Mr. HINSHAW. And it can be gotten from the Johnsonville steam plant, as I understand it, over the transmission lines of the TVA.

Mr. WILLIAMS. In an emergency, in low-water periods, I suppose that would be true. I do not know all the details.

Mr. HINSHAW. So it was stated for the record, and I presume the AEC must have made some recommendations to the TVA concerning the need for the Johnsonville steam plant insofar as the AEC was concerned. Do you know about that?

Mr. WILLIAMS. In fact, we had plans to enlarge our generating capacity unless TVA could assure us of furnishing this additional power.

Mr. HINSHAW. Then it is not your plan to further enlarge the present facilities for generation of power at K-25 steam plant?

Mr. WILLIAMS. Not for the present addition of the plant.

Mr. HINSHAW. I hope we do not duplicate facilities too much.

That is all, Mr. Chairman.

The CHAIRMAN. Mr. Van Zandt?

Mr. VAN ZANDT. Mr. Williams, on Friday last did you include among the many elements that were available in the vicinity of Oak Ridge gas that caused the location of the installation there?

Mr. WILLIAMS. No, sir.

Mr. VAN ZANDT. I mean coal. I should have said coal.

Mr. WILLIAMS. I did not.

The CHAIRMAN. You included coal.

Mr. WILLIAMS. I said that coal was not a major reason, I believe.

Mr. VAN ZANDT. I checked over the week end, and I found that coal was a factor, one of the factors that served as a basis for the location of the installation in that vicinity.

Now, if the Commission were to be guaranteed the necessary coal, would that be satisfactory for the installation there?

Mr. WILLIAMS. I do not know, sir, if you can consider this a hypothetical question or not that you are asking me, but if we could be definitely sure that every day we would have enough coal to run the boilers, that is our intention. That is our requirement.

Mr. VAN ZANDT. Now, during the consideration of the question of shifting from coal to gas, did you approach the coal operators in the South in an effort to work out an agreement that would guarantee you the necessary stock pile of coal?

Mr. WILLIAMS. Not that I know of.

Mr. VAN ZANDT. Did Mr. Pike?

Mr. PIKE. I do not think so, Mr. Van Zandt. They were well aware that this proposition was up and appeared in opposition to our application at the Power Commission.

If anybody in the coal business had come up and made a livable, workable guarantee of sufficient supply of coal at a price which is competitive with what we are going to get the gas for, we certainly would study it. Nobody did.

Mr. VAN ZANDT. We will hold the question of prices until later. Did you approach the southern operators?

Mr. WILLIAMS. No, sir.

Mr. VAN ZANDT. In an effort to provide a guaranteed stock pile of coal?

Mr. PIKE. No, sir; we did not.

Mr. VAN ZANDT. Did you talk to the United Mine Workers in an effort to work out a moratorium on strikes?

Mr. WILLIAMS. No, sir; we did not.

Mr. VAN ZANDT. In your consideration of the shifting from coal to gas—

Mr. PIKE. I would love to see that done, incidentally.

Mr. VAN ZANDT. Is it not true that during the war they had such a moratorium on strikes?

Mr. PIKE. They had plenty of work stoppages during the war. I do not know whether you call them strikes or not, but when I had to handle pricing of coal during the war, there were plenty of times we had work stoppages. I think they were given a different name.

Mr. VAN ZANDT. Is it not true that during strikes hospitals are furnished coal and other institutions that require coal?

Mr. PIKE. I have heard they were, Mr. Van Zandt.

Mr. VAN ZANDT. And my understanding is that during the war all the labor leaders gave to the Government assurance that they would get the products that were necessary to prosecute the war.

Mr. PIKE. There was real cooperation, of course.

Mr. VAN ZANDT. This is a national defense item, is it not?

Mr. PIKE. We think so.

Mr. VAN ZANDT. Now, when you gave consideration to the shifting from coal to natural gas, did you take into consideration the impact upon the jobs of the railroaders and coal miners in the vicinity of Oak Ridge?

Mr. PIKE. Yes, sir; but we did not weigh it very heavily, and I will be glad to tell you why, because we are spending Government money. Generally speaking, when we get several alternate sources of supply, we take the supply that will give us what we want at the best possible price.

During this last several years at that plant alone employment has run down from 11,000 to about 4,800, a drop of over 6,000 people. It would be quite an intolerable burden on management, it seems to me, when it makes an economy, to have to follow through to the ultimate effects. This is a competitive economy and I realize that 300 or 400 coal miners would probably have to peddle their wares in some other manner, but I do not think it can weigh as heavily with us who have the responsibility of economizing with Government money.

Mr. VAN ZANDT. You realize that the coal business of the Southern Railroad and L. & N. in that vicinity amounts to quite an item?

Mr. PIKE. Yes, sir; my firm used to control Southern Railway at one time, and we are pretty well aware that it hauls a lot of coal.

Mr. VAN ZANDT. In addition to the destructive effects on the jobs of coal miners, it also destroys the jobs of railroaders.

Mr. PIKE. It will cut down a good many cars a day.

Mr. VAN ZANDT. Of course, you realize that the coal miner very seldom shifts his location. He generally stays in one area.

Mr. PIKE. That is right.

Mr. VAN ZANDT. So, while you are talking about saving on one hand, you are destroying the job of a coal miner on the other, and probably forcing the taxpayers of the country to take care of him on relief; so is that a saving to the American taxpayer?

Mr. PIKE. Well, I suppose in the long run it is. This goes to a very tough question, Mr. Van Zandt, as you know very well. You create technological unemployment because you go to a better and cheaper source of supply, and somebody has to absorb those workers who were laid off. I doubt if it is primarily the responsibility of us as managers of an enterprise to carry through in every one of those cases. That is my personal opinion.

Mr. WILLIAMS. If I might, I would like to add a personal remark here. I worked in the coal mines 3 years and I know what it is. I personally feel that you are doing a man a favor if you do something to get him out of the mines and get him into some other business, after my experience in the mines. This is just a personal remark and I say this from experience. I worked 3 years in the mines when I was getting through high school.

Mr. VAN ZANDT. I appreciate the position of the gentleman, but still it is not saving the jobs that are being destroyed by this shift from coal to gas.

Now, a moment ago you talked about the pipe-line certificate that was granted by the Federal Power Commission to the East Tennessee Co. to provide gas, I think, for the city of Knoxville. Is it true that the Commission granted the certificate or did they not?

Mr. PIKE. I do not know, Mr. Van Zandt. It is a completely different application. I have not followed it.

Mr. VAN ZANDT. Is it not correct for me to say that you should have taken that into consideration? You should have checked with the Federal Power Commission to ascertain whether or not they had granted a certificate for this pipe line into Knoxville.

Mr. VOLPE. May I answer that, Mr. Van Zandt?

As I understand there were two applications before the Federal Power Commission by East Tennessee. One was an application for piping gas into Knoxville, which would have been a separate route; the other was to pipe gas into Oak Ridge. The East Tennessee Co.

could not go ahead with their application for piping gas into Knoxville, but did go ahead on their application to pipe gas into Oak Ridge.

Now, at the time the application was heard for piping gas into Oak Ridge, the Federal Power Commission did consider the question of whether or not if this certificate was granted there would be a supply of gas for the pipe into Knoxville and the other communities, and the Federal Power Commission was assured by Tennessee Gas & Transmission that there would be a supply of gas, so that, in brief, they did not go ahead with their application for piping gas into Knoxville but went ahead with their application for Oak Ridge.

Mr. VAN ZANDT. We have here evidence of the fact that the certificate was granted and since the AEC came along with this new pipe line they have abandoned the construction of the pipe line for which they have been granted the certificate.

Now, getting back to the coal miners, again: Mr. Williams, if we are to follow your observations, I would like to ask you the question of who is going to mine the coal that is necessary for the country?

Mr. WILLIAMS. Well, the demand for coal, in spite of temporary discontinuances here and there, I believe, has been mounting steadily, and I think that the men will have work—all those who want to work—and I think that possibly if you got into all the details of putting men out of work in the mines, that if you looked at some of the mines in West Virginia that I am somewhat familiar with, that I worked in, that there probably have been some men displaced, quite a few, by the mechanization of the mines.

Mr. VAN ZANDT. But still we have unemployed miners today.

Mr. WILLIAMS. That is probably the reason—I mean for a large number of them.

Mr. VAN ZANDT. Well, in Pennsylvania we have unemployed miners because the demand for coal has fallen considerably.

Mr. WILLIAMS. The demand has fallen considerably at the present time. The demand for coal, I suppose, is seasonal; but the over-all demand, from year to year, I believe has gone up.

Mr. VAN ZANDT. One more question, Mr. Chairman.

I would like to ask, Mr. Pike, whether or not a message had been conveyed to you from the chairman of this committee in which the Commission was asked that they should delay—or that it was suggested, rather—suggested that they should delay any further action on the construction of this pipe line?

Mr. PIKE. The chairman of the committee did not speak to me, sir.

Mr. VAN ZANDT. I wonder if Mr. Shugg is present?

Mr. PIKE. That is right.

Mr. SHUGG. Yes.

Mr. VAN ZANDT. Mr. Shugg, is it not correct that the chairman of the congressional committee suggested to you that it might be wise for the Atomic Energy Commission to stop the construction of this pipe line immediately?

Mr. SHUGG. I received a telephone message on that, Mr. Van Zandt, and passed that up to the Commission.

Mr. VAN ZANDT. Up to the Commission? You mean Mr. Lilienthal?

Mr. SHUGG. And——

Mr. PIKE. To me.

Mr. SHUGG. (continuing). One other member.

Mr. PIKE. I know what you mean.

Mr. VAN ZANDT. What consideration did you give to that request or to the suggestion of the chairman of this committee?

Mr. PIKE. We immediately got to work trying to get up a letter to obtain a reconsideration, but frankly there were so many things happening in such a short time that I am not very clear—

Mr. VAN ZANDT. You received the suggestion and apparently did nothing about it?

Mr. PIKE. I took it up with the Commission, I think, the next time we met; whether it was the next morning or not, I am not sure. We had several days go by without doing it at a Commission meeting at all. I would have to check the record on that, Mr. Van Zandt.

Mr. VAN ZANDT. Well, apparently the Commission disregards entirely the suggestions of this committee, and—

Mr. PIKE. I do not think that has been our policy, Mr. Van Zandt.

Mr. VAN ZANDT. Apparently; no action was taken. You must understand that we, the members of the committee, represent various sections of the country, and we have the economy of this country at heart just the same as you people should have, and our suggestions are apparently tabled; period.

Mr. PIKE. We have the economy of the AEC at heart, and as Mr. Williams has said, and Mr. Volpe, here is a contract on which work was not stopping. They had been very busy raising finances, they had been very busy getting their pipe; pipe was just being delivered; they had what they believed was a valid contract with us, and they kept on at work. I seriously doubt if we should stop that, Mr. Van Zandt. I do not mean that means any disrespect to that committee at all. I certainly am sure that none was ever intended.

Mr. VAN ZANDT. That is all, Mr. Chairman.

The CHAIRMAN. Mr. Elston?

Mr. ELSTON. Mr. Chairman, I just want to refer to the application for a rehearing before the Federal Power Commission. I have now been handed a copy of the application. It is dated June 1, 1949, and was filed by the National Coal Association, United Mine Workers of America, and the Railway Labor Executives Association, and, according to the application, the East Tennessee Natural Gas Co. was served with a notice of the application for a rehearing, and the Atomic Energy Commission was also served with a notice of this application for a rehearing.

Senator HICKENLOOPER. What was the date of service, Mr. Elston; does it show there?

Mr. ELSTON. The date of service does not appear.

It simply is a certificate—yes, certificate states:

I hereby certify that I have today served a copy of the within application and memorandum upon the following-named parties to the proceeding by depositing the same in the United States mail—

and the certification is dated June 1, 1949, and is signed by Tom J. McGrath, 324 Shoreham Building, Washington, D. C., who is the attorney for the parties asking for the rehearing.

Mr. VOLPE. Mr. Chairman?

The CHAIRMAN. Mr. Volpe.

Mr. VOLPE. I recall now the motion Mr. Elston had reference to. There has been no action taken, and you will recall that the coal association intervened in the application by East Tennessee, and they

participated in the proceedings, which took place before the Federal Power Commission on their request for a certificate.

The application now referred to for rehearing was made by the National Coal Association after the certificate was issued, and I do recall now that we have received a copy of it.

Mr. ELSTON. Do I understand you paid no attention to the application?

Mr. VOLPE. Mr. Elston, it is not for us to pay attention to the application of the National Coal Association. This is a problem for the Federal Power Commission.

Mr. ELSTON. If the Federal Power Commission grants the application for a rehearing and turns down the certificate which has already been granted, it seems to me that you would be very much interested in it.

Mr. VOLPE. Mr. Elston, whether the Federal Power Commission will take any action to hold matters in status quo, I do not know. They have issued a certificate to East Tennessee and, so far as I know, the Federal Power Commission has not advised Tennessee or the Atomic Energy Commission that they intend to disturb that certificate.

Now, they may want to, on their own motion, direct East Tennessee not to take any further action; but the proceedings in connection with the certificate are entirely in the hands of the Federal Power Commission.

Mr. ELSTON. If the certificate is granted, the application is granted, and the certificate is refused on rehearing. Then, of course, your contract does not mean anything; does it?

Mr. VOLPE. That is right. The contract is made subject to East Tennessee's getting a certificate from the Federal Power Commission.

Mr. ELSTON. Notwithstanding the fact that the refusal now to go ahead and grant a certificate might stop all the work, are you going ahead with the contract just the same?

Mr. VOLPE. Mr. Elston, we have at the present time a legally binding contract with East Tennessee. At the present time, in view of the fact that the Federal Power Commission has issued a certificate, if we stop work under that contract the United States Government is liable to East Tennessee for damages, because East Tennessee has complied fully with the terms of the contract since they have obtained a certificate.

Mr. ELSTON. Well, the certificate might be recalled, and if the certificate is recalled by the Federal Power Commission there would be no liability; would there?

Mr. VOLPE. That is true, sir, but that is not true of the present position, because they do have a certificate at the present time.

Mr. ELSTON. Yes, but there is an application for a rehearing pending before the Federal Power Commission.

Mr. VOLPE. Well, as Mr. Elston well knows, an application does not in any way minimize the Government's responsibility under this contract for damages in the event that the Government took action to rescind the contract.

Mr. ELSTON. If the Federal Power Commission rescinded the certificate, there would be no obligation on the part of the Commission.

Mr. VOLPE. That is true, but that is not the situation at the present time.

Mr. ELSTON. You do not know that they will not rescind it.

Mr. VOLPE. I do not, sir.

Mr. ELSTON. And yet you are going ahead with all the terms and provisions and conditions of the contract.

Mr. VOLPE. We have an enforceable contract at the present time, and what I am saying, sir, is that in the present state of affairs with a valid certificate issued by the Federal Power Commission, if we interrupt the contract—I mean if the Commission were to find that there was some reason for interrupting the contract at the present time—we would be liable to East Tennessee for damages.

Mr. ELSTON. Even though there is application for a rehearing pending?

Mr. VOLPE. Yes, sir. The application in no way affects that contract.

Mr. ELSTON. That is all.

The CHAIRMAN. It is correct to say that this is in line with respect to the present controversy, but I think it is worth while pointing out for the future that there is a provision in the act that, whenever atomic energy is developed far enough to be useful in our national economy, a license cannot be granted by the Commission for its use as a motive power, or any other way, until the Congress had an opportunity of 90 days within which to approve that proposed permit or license. I just want to make the observation.

Along the lines of Congressman Van Zandt's statement of displacing the coal miners, I imagine the hearings, if and when they come at some future time, will provide a most interesting time for the Congress in making such a determination. We do not have to worry about it, I am very happy to say, in one respect right now, but someday we are going to have to face that.

Now, if we are through with this phase of the matter——

Mr. WILLIAMS. Might I say something?

The CHAIRMAN. Yes.

Mr. WILLIAMS. I would like to point out, as a last remark, that on the question of laying people off or having people out of work, since about August 1945 we have laid off in the interest of economy at Oak Ridge, in the interest of economy to the taxpayers, something over 20,000 people. I could give the exact figures, but I know it is well over 20,000 people, and we have done it in the interest of economy.

Mr. COLE. Mr. Chairman?

The CHAIRMAN. Mr. Cole?

Mr. COLE. I would like to inquire of Mr. Pike whether he knows anything about the corporate structure, the incorporation, the incorporators, the stockholders, of the East Tennessee Co., which was, I understand, organized solely for the purpose of building this line.

Mr. PIKE. I have not had that in my head, but I think it is very easily available. We can furnish it very quickly.

(The information referred to above is marked "Exhibit 16" and will be found in the appendix.)

Mr. COLE. Was any inquiry made by the Commission?

Mr. PIKE. Yes, sir; we took a look at it. Very briefly, they seemed to be adequately financed. Of course, that is really up to them, and I believe the thing—and, of course, the Federal Power Commission in

its hearings goes into the ability to perform. They got their money; I believe they are quite adequately financed. I do believe it was formed very largely for these two purposes. It is a new company. I do not happen to know the people in it very well. I have met them at one or two of the hearings.

Mr. COLE. Are any of the people connected with East Tennessee in that venture connected by employment or relationship or kinship with anybody in the Atomic Energy Commission?

Mr. PIKE. Not that I have heard of.

Mr. COLE. Or in the Commission's enterprises?

Mr. PIKE. Not that I heard of. I would be very much surprised.

Mr. COLE. Do you know that the East Tennessee Co. is getting its financing from Government sources or not?

Mr. PIKE. I understand it is not. The record ought to be pretty clear. I understand they got their finances in New York; I think from some insurance company.

Mr. COLE. Do I understand that in your opinion this pipe line will pay off its cost in 10 years' time?

Mr. PIKE. I am not quite sure about the time. I think we sort of know semiofficially that they are putting in a line that will carry about 100,000,000 feet. They plan, as I have been told, to extend this line farther east into Tennessee to—let me see, I think Bristol—Johnsonville.

Mr. COLE. Whether it pays off in 10 years then will depend on the extension and the consumption out of the extensions, or will the 10 years' pay-off be reached through AEC consumption?

Mr. PIKE. Well, it would be reached quicker, of course, if they could fill the whole 100,000,000 feet, but I think they have figured that they can amortize this line selling gas by reason of the saving over the present cost of coal, and I do not know the time in which it will pay off.

Mr. COLE. Did the Commission give any consideration to the idea of building this line itself in view of the fact that it was apparently so profitable?

Mr. PIKE. Yes; we did think of it. We did think of it. I do not know how formal the thinking was, but I remember in several of the early discussions there was a real question as to whether we ought to put up 8 or 10 million dollars of the Government's money and go over there and tie into the East Tennessee line.

Mr. COLE. If it would pay off in 5 or 6 years, I think you would be amply justified in doing that.

Mr. PIKE. I think the "5 or 6 years" statement was an optimistic statement.

Mr. COLE. You say you are saving a million and a quarter each year.

Mr. PIKE. For us, yes. I think we could have shown a bigger saving, but one reason I would have rather been against it—one reason is that we are in every kind of business, and we have to be; and the second thing is, while this initially comes over with us as the only customer, it is completely obvious, with the history of the natural-gas business, that, when you run a line through, eventually people along the line will want gas from it, and you run extensions, and in

the long run this will probably be as much of a utility line as it will a line for us. We did think of it, and we made the decision not to go forward with that piece of Government construction. I am inclined to think that I would still——

Mr. COLE. You are satisfied that there is nobody connected financially or interested financially with the East Tennessee Co., who is directly or indirectly connected with the atomic energy program?

Mr. PIKE. I have never made any investigation, but I would certainly be very much surprised to find that anything of the case were true.

The CHAIRMAN. Now, if there are no further questions on this matter, we can proceed to another matter which Senator Hickenlooper wishes to inquire into.

I will say to the Commission, and its Chairman, that Senator Hickenlooper intends to inquire into the matter of the school at Hanford, the high school.

Will you please come forward and bring your witnesses.

**STATEMENT OF DAVID E. LILIENTHAL, CHAIRMAN, ACCOMPANIED BY CARLETON SHUGG, DEPUTY GENERAL MANAGER, AND JOSEPH VOLPE, JR., GENERAL COUNSEL, UNITED STATES ATOMIC ENERGY COMMISSION; AND H. A. WINNE, VICE PRESIDENT IN CHARGE OF ENGINEERING, F. E. BAKER, CONTROLLER, AND G. R. PROUT, VICE PRESIDENT, NUCLEONICS DEPARTMENT, GENERAL ELECTRIC CO.**

Senator HICKENLOOPER, Mr. Chairman, just for the sake of the record and without engaging in any controversy on this point, I would like to again recall that at the beginning of these hearings I wanted to use a substantial number of investigative cases to illustrate the mechanics of the procedure, but there was considerable objection raised, and the objection of civil rights and exposure, danger of exposure, of things was brought up.

But it is interesting to note that when the Bulletin of the Atomic Scientists in September of 1948 wants to take the case of Dr. A and abstract it, very favorably to Dr. A, the case of Dr. B and abstract that with favorable comments toward Dr. B, and the case of Dr. C, and a column or two about the alleged information contained in the file, the case of Dr. D and alleged information that is contained in the file, the case of Mr. E, the case of Dr. F, the case of Mr. G, with alleged statements of information contained in the investigative file, I heard no objection to the fact that civil liberties were being invaded; and I may also call your attention to the fact that I had no intention in the cases I was using of even attempting to abstract the information which was in the file.

It has caused some considerable editorial comment, these particular cases, and I would like, just for the sake of the record, to have this article called Some Individual Cases of Clearance Procedures, beginning on page 281 of the Bulletin of the Atomic Scientists for September 1948, be placed in the record at this point—just for the information therein contained.

(The article referred to is as follows:)

SOME INDIVIDUAL CASES OF CLEARANCE PROCEDURES

(By Committee on Secrecy and Clearance, Federation of American Scientists)

[This report illustrates in greater detail some of the findings of a survey on clearance procedures reported by the federation's committee on secrecy and clearance in the April and June issues of the Bulletin. Members of the committee are: S. H. Bauer, chairman, H. A. Bethe, L. M. Brown, P. J. W. Debye, G. K. Fraenkel, A. R. Moore, P. Morrison, R. S. Rochlin, and R. R. Wilson]

In previous articles 7, 8, this committee has reported the results of a questionnaire survey designed to obtain information on loyalty clearance procedures affecting scientists. These questionnaires were sent to the directors of representative Government and non-Government laboratories. We have, in addition, received many reports from individuals giving accounts of their personal experience with these procedures, and it is a sample of these reports which we present here.

This committee mailed in November 1947 a general request to members of the Federation of American Scientists to inform us of any cases known to them of allegedly unfair clearance procedures. In this manner we learned of 76 cases, of which 56 involve scientists.

In general, it is difficult to obtain such information. If an individual is denied clearance, he hesitates to inform even his friends because of the implied reflection on his character, however unwarranted the clearance denial may be. Therefore, the response to our request probably represents a small fraction of the total number of cases.

In view of the widespread interest in clearance problems, this committee has felt it desirable to make public a selected number of these individual cases in detail. We have, of course, no way of checking the veracity of each letter sent to us. We can state only that, in each case described below, the facts are taken directly from a letter in our files, signed by the individual concerned, and that specific permission to publish this information was obtained from each individual. For obvious reasons we have eliminated any details which would identify these persons.

THE CASE OF DR. A

Dr. A was offered a post as physiologist P-6 in an Army laboratory. He was informed that he had been cleared by Military Intelligence. Turning down other offers, he moved to the east coast from California, where he had been living for 20 years, to assume his duties. Prior to this, he had had 15 years of research experience at universities.

Dr. A. reports in a letter to this committee:

"\* \* \* Two months after I arrived here I was abruptly informed that the clearance I had received was only an interim one and that I was not cleared. I was offered the alternative of resigning 'without prejudice' or of being suspended. I was curtly informed an appeal would be fruitless and if suspended I would be ultimately dismissed 'with cause' and it would be so entered into my record. That evening, at the quarters of a representative of the Military Intelligence, where I demanded to know the reasons, I was told that there were no charges against me but that Military Intelligence considered me a potential 'risk' for the following reasons:

"(1) The birthplace of my parents.

"(2) I was a member of the Federation of Atomic Scientists.

"(3) I was a member of the Independent Citizens Committee of the Arts, Sciences, and Professions.

"(4) I knew too many left-wing people like the late ———.

"All the above information was, of course, incorporated in the PSQ form on which I had been given my original clearance. On the basis of the above, I was considered to be either a Communist or a 'fellow-traveler.'

"For your information, I am a Democrat, considered liberal by those who know me. I am not now, nor ever have been, a Communist or 'fellow traveler' (whatever the latter means). Furthermore, I view with equal repugnance dictatorships of either the left or the right. In addition to a good academic research reputation I have a 4½-year record of accomplishment as responsible investigator for OSRD-cmr and BuMed and Surgery projects. These were carried on during the war while I was at ———, and were highly classified."

Dr. A decided against resigning and so was suspended "in the interests of national security" without a hearing. Five months later, the Secretary of the Army ordered his reinstatement and stated that the "action taken was unjustified." He received his back pay and an apology. He then resigned to accept a better position.

#### THE CASE OF DRS. B.

Drs. B, husband and wife, had worked for a large electrical company as physicists, for 5 and 10 years, respectively. In October 1946 they were persuaded to accept positions doing nonsecret work at the Brookhaven Laboratory of the Atomic Energy Commission and made arrangements to leave:

"We purchased a house \* \* \* and in January 1947 we moved \* \* \* to Long Island. On our moving day we heard for the first time that our clearances were being held up. We were given no reason and could think of none. Dr. ——— was sure that the matter would be cleared up shortly although he wrote us saying that he could not make any commitment concerning our possible connection with Brookhaven later. In our conversation he requested us to refrain from any discussion of our case since he felt that publicity might be prejudicial to us. We could see that it would be undesirable from the laboratory's viewpoint and we agreed to this procedure.

"We then entered upon a period of uncertainty and virtual isolation which was to last until the middle of August, although periodic calls to Dr. ——— and other Brookhaven personnel elicited assurances that the matter would be settled in a week or two. Early in March we were visited by two representatives of the FBI who questioned us for an hour or so. Some of their questions concerned a college friend whom we had not seen for 6 years, and who was arrested during the Canadian spy scare. We attributed our difficulties to this connection for 2 days, but then our friend was acquitted, completely exonerated, and reinstated in his job at Queen's University. This apparently had no effect on our case. The FBI were also interested in our acquaintances among the UERMWA, the union under which the ——— workers were organized. They probed into our opinions and activities during the ——— strike and questioned us regarding our opinions of communism, international control of atomic energy, and the appropriate treatment for spies and saboteurs. In spite of the unpleasant implications of such questions we tried to cooperate as thoroughly as possible and to make it obvious that no reason existed for questioning our loyalty and integrity.

"Nothing further happened until July 9 when we were invited at 7 a. m. to go to Washington that same day at our own expense for a 'hearing.' One of us flew to Washington where he was questioned by a three-man group which was willing to identify itself to us only to the extent of stating it was not part of the AEC organization. The hearing covered exactly the same ground as had been covered 4 months before by the FBI.

"This expedition also produced no visible results. By this time even Dr. ——— agreed that no further purpose was to be served by reticence and we brought our situation to the attention of the Federation of American Scientists. The Federation wrote to the AEC early in August in our behalf making a strong request that our case be decided one way or the other. Perhaps as a result of this letter, or possibly by coincidence, we were granted provisional clearances on August 14 and shortly after started work at Brookhaven.

"We still have had no explanation of the delay. We are still working under provisional clearances. And we have had no compensation for the half-year period when we were without income."

#### THE CASE OF DR. C

Dr. C is a biologist of 19 years' experience who has published more than 60 papers. In 1946, he was made chief of a section at a United States Army research laboratory. This position terminated without notice or explanation after he had been there for several months. He gives his story as follows:

"\* \* \* Colonel X, the director of the Y laboratory, called me into his office, closed the doors, brought in Lt. Col. ——— as a witness, and told me he had received an order from the commanding general of Y to terminate my services, because I could not be cleared for access to classified documents. I explained that I had already been cleared during the war, had read numerous secret documents in the course of my work, and was myself author of a number of classified publications, and the holder of patents pending with the Army and

Navy, likewise classified. Col. X then said that if I resigned straightaway, nothing further would be said about the matter. I replied at once that I would do nothing of the sort, as it would be tantamount to an admission of guilt concerning charges of which he refused to apprise me, and of which I was ignorant (and still am).

"I made preparations for leaving early the following morning to look for a job in Washington, and returned late the following night to my quarters in one of the officers' barracks \* \* \*. The next day a GI entered my bedroom at 6:20 a. m. without knocking and ordered me to report to the kitchen. He returned a short time later, and said he had orders personally to conduct me there, and that a civilian on a military reservation had no civil rights, but was subject to military discretion. By this time I was fully roused and half dressed, and telephoned the officer in charge at the mess to inquire what he wanted. He said that he had been looking for me all the previous day, and ordered me to vacate my room at once. I explained that in the course of 2 months I had brought many of my personal effects, books, and some paintings, and it would take some time to pack them. He replied that if I did not follow his orders he would send over some soldiers, and throw the stuff out.

"With the aid of a number of friends, and a borrowed car, I managed to collect cartons, and pack my things \* \* \*. At lunch time I ran into Colonel X, who was accompanying a civilian who was considering a job at Y. The latter asked me how things were. I felt obliged to tell him frankly what had transpired and in the presence of Colonel X, who did not contradict a single word. In the presence of this person Colonel X also suggested that I explain to anyone inquiring why I had left Y. that I had done so because I did not like the place. I replied that I would tell no such untruth to anyone."

Dr. C then spent several weeks trying vainly at various places, including the Pentagon building and the Civil Service Commission, to ascertain the charges presented against him.

"\* \* \* At G-2 HQ (military intelligence) in ———, I had rather a unique interview with Colonel ———, who refused to tell me what charges were preferred against me (even though as I subsequently learned this is required in the Civilian Personnel Regulations), denied some of the basic principles of civil service, and blew up because I recorded his statements in a notebook. I even showed him what I had written.

"I might state here that I have never been a member of the Communist Party, and know practically nothing of their activities. \* \* \* Why I was denied clearance at Y, after having (previously) been cleared at the ——— laboratory, I have been unable to ascertain. Both my parents were born in Kovno, Lithuania (formerly Kovno, Russia). I subscribe to PM, In Fact, The New Republic, Consumers' Union, and receive about a dozen scientific publications. After the war I received a letter of commendation from the group leader and a certificate of effective service from the OSRD."

After 5 months of unemployment, Dr. C secured another position doing unclassified work. In spite of the fact that he was not able to learn the charges against him, much less contest them, he is apparently not to be given the chance to be judged on his merits in his new job.

"\* \* \* After having been at the Z laboratory about 6 months, I was informed only recently that the Army's Central Intelligence Bureau, unsolicited, sent representatives to the Assistant Director of Z, and to the chief of the laboratory I have been working in, to make representations concerning me. It appears that the Army proposes to 'hound' me out of any position I may succeed in obtaining. There is no question that the Y dismissal has made it difficult for me to obtain another job, as my subsequent attempts demonstrated. This is true despite the fact that the report of the President's Scientific Research Board \* \* \* bewails at great length the shortage of adequately trained and experienced personnel to attack the Nation's urgent health problems. \* \* \* It may be appropriate to point out at this juncture that these health problems are as yet unclassified projects."

#### THE CASE OF DR. D

Dr. D, a young physicist, had recently received his Ph. D. and had been employed in the research laboratory of the ——— Co. at the time he was refused clearance. So sure was he that a mistake had been made in his case, and so important to his future did he consider this action, that he spent a year and a half trying to obtain a statement of charges and a hearing, first from the Man-

hattan District and then from the Atomic Energy Commission. He did not succeed, however, and in a recent letter to this committee, he wrote:

"Frankly, I'm quite discouraged and am ready to give up. I'm looking for a university position now. \* \* \* I hope I never hear the word 'clearance' again. This is probably running away from my problem, but I've wasted enough time here, and I've got to get out and do some physics."

Some of the experiences in trying to find out the reasons why he was not cleared may be of interest:

"On October 14 I spoke to Lt. ———, officer in the area engineer's office here in charge of clearance. He told me some things that were not responsible for my not being cleared, and then lectured briefly on the evils of organization in reference to an organization I had belonged to in ———. However, he would not commit himself to the statement that this was the reason for refusing my clearance. In fact, he said that there was 'something' further about the case that he would like to tell me—for your own good—but that he could not for security reasons. He said that my record indicated no reason to doubt my personal loyalty. In answer to my query as to what I could do, since I did not feel satisfied, he suggested that I ask the ——— Co. to request a review of the case."

This request was made, and clearance was again refused. The organization mentioned above, membership in which was the only specific item mentioned by any official in a year and a half of searching by Dr. D, was described by him as follows:

"[It was] a group whose purpose was to work for equality of opportunity for all people, regardless of race or color \* \* \* The objectives of the organization, \* \* \* were in accord with those of churches and other humanitarian organizations with whom they cooperated \* \* \* Typical examples of things we did are: \* \* \* participated actively in campaigns to try to obtain fair employment practice legislation; visited the mayor of——to urge him to act to stop an upsurge of racial prejudice and discrimination in the city, and made concrete suggestions for a city-wide educational program on racial tolerance; drew up definite plans for public housing programs for low-income groups, into which class most of the people of the organization fell; spoke to managers of establishments known to discriminate against Negroes, and tried to convince them that such action was morally wrong and in violation of existing \* \* \* State laws. \* \* \*"

In addition to the above, Dr. D points out in considerable detail that while he was a member he never had any reason to suspect that any members of this organization were Communists, and that ever since 9 months before applying for clearance he has had no relations with this group or its members.

#### THE CASE OF MR. E

The author of the following letter was refused clearance and dismissed from the research laboratory of a prominent electrical manufacturing company. He writes:

"A year ago [December, 1946] I was summoned to the office of Dr. ———, head of the laboratory, and was abruptly told to submit my resignation because I had not been cleared by the Army for ——— work. This came as a complete shock as I had been employed by the laboratory for seven and a half years, including the war years when I had been covered by security clearance. For these reasons, I was referred to the V laboratories security officer who told me nothing but suggested 'that they know who my friends were.' This may have referred to my personal or my social friends; I do not know. No appeal was possible. I was subsequently informed that the 1-month period initially given me 'to get out' was modified to cover such time, up to several months, as was necessary for me to find employment elsewhere. Dr. ——— and other laboratory managerial personnel had meanwhile received protests of other members of the laboratory who either felt there had been no previous understanding that failure to receive clearance would result in dismissal or who felt that I had been treated too harshly. In no manner, to repeat, was I given either the opportunity to appeal my case or to learn any more definitely the reasons for my failure to receive clearance."

"To make matters worse, the V Co. was able to use me on nonsecret work at their J laboratory, for I was asked to make a visit there for an interview. This interview, however, was canceled by the J people after 'checking with the research lab in——.' Similarly while I was visiting [a separate industrial firm] where clearance was no issue, my interview was abruptly terminated—they informed me they had 'checked with the V research laboratory in——.'"

## THE CASE OF DR. F

Dr. F is a physicist and mechanical engineer who had worked for a number of years in the aircraft industry. In his case failure to obtain clearance has had rather drastic effects. He states that inasmuch as practically all work being done in aircraft research is being financed by the armed services, his clearance difficulties practically eliminate this field of employment for him.

During the war, Dr. F had been cleared by Navy Intelligence, Army Intelligence, and by the FBI (for OSRD). After the war, he was employed by a large aircraft company on an Army Air Force project. Application was made for clearance early in 1946. Dr. F was transferred to other work of a nonsecret nature and when this was completed he was given a leave of absence without pay. Later he received a letter from the company which said in part:

"Notice was received by us in January 1947 that your services could not be used on classified projects, pending complete investigation. Following receipt of this notice, we \* \* \* assigned you to unclassified work. When the unclassified work available was completed, and your clearance had still not been received, there was no alternative but to terminate your employment.

"Your work had been satisfactory, and inasmuch as a large amount of classified work for which you were qualified has continually existed since your termination, it is probable that your employment by us would have continued, provided that your clearance for access to classified information had been received."

In Dr. F's letter to this committee he states:

"The 'complete investigation' is presumably still going on [March 1948]. I am on leave of absence without pay; I am neither cleared nor uncleared.

"Mr. —, the local AAF leg man in such matters, tells me that there are cases in which this indeterminate condition has existed for 18 months and is still going strongly. My offer to aid in the investigation was declined. I voluntarily wrote a long letter giving my views and personal history in practically every category which I thought might have bearing. \* \* \* I have been unable to find the reason for the delay or the nature of the difficulty. \* \* \* I do not know of any action which I can take which will stimulate a decision. \* \* \*

"I applied for a job requiring Navy clearance. The same day the local office of Naval Intelligence was able to inform my prospective employer that, \* \* \* they also would not be able to clear you for confidential work.' Again no hint as to the reasons, no effective method of review.

"I have discussed employment with the head of the mechanical engineering department of — University. I learned that approximately 99 percent of the funds currently being spent on research are supplied by the Navy and that again the Navy clearance is required of all university employees who participate in the spending of this money. Needless to say, my probable difficulty in obtaining this clearance did not enhance my value as a prospective employee."

In the letter mentioned above, which was addressed to the general in command of the AAF project for which clearance was refused, Dr. F' states, in part:

"As opposed to any existing or proposed alternative forms of government, I much prefer our own, I have repeatedly defended its virtues in arguments with people who advocate other systems. By and large, I subscribe to the editorial policies expressed in the Wall Street Journal, Fortune, and Time magazine. I have been a subscriber and reader of all of these publications for several years. \* \* \*

"I view with great apprehension the rising tide of communism throughout the world. I favor all measures, including a vigorous military research and development program which will strengthen us and our Government."

## THE CASE OF MR. G

Mr. G is a chemist who has traversed a complex path of clearances and denial of clearance for a period of 2 years. For 4 years previous to the events described below, he had worked on various classified projects including 3 years during the war with the Manhattan District. During this time, his clearance status was not questioned.

Early in 1946 he was asked to join a group urgently needed at Los Alamos to work on the Bikini atomic bomb tests. Mr. G made immediate plans for leaving, but the day before his planned departure, a telephone message was received stating that he had not been cleared. He writes:

"This came as a shock to my wife and me. \* \* \* I know of absolutely no reason why I should not be cleared. I have never belonged to any subversive

organizations nor taken part in any subversive activities, nor has my wife. \* \* \* The denial of clearance resulted in a series of indignation meetings among my associates. \* \* \* Dr. ——— who had gone on to Los Alamos, had been told that my case had gone up to the highest authorities, who had personally refused my clearance. Accordingly, on February 21, I sent a telegram to Gen. Leslie R. Groves asking either that I be cleared or be told the reason why clearance was refused. \* \* \* On February 26, I received a reply from General Groves:

"Apparently there has been some misunderstanding concerning your clearance status. I have checked into this matter and find that you have been cleared for employment at Los Alamos—Maj. Gen. L. R. GROVES, *Manhattan District, Washington, D. C.*"

Upon arrival at Los Alamos, Mr. G was told to make preparations for going overseas, which he did. Three days before the party left, however, the laboratory director told Mr. G that he was unwilling to request the additional clearance needed for leaving the country, as he anticipated trouble in obtaining it. A few days later the same official told Mr. G that there was not the slightest doubt but that he would have been cleared to go overseas, but that he was needed to take charge of ——— at Los Alamos.

When Mr. G returned from Los Alamos he inquired about the possibility of becoming a consultant-without-pay to the AEC laboratory at which he had been employed during the war. He writes:

"\* \* \* Reasons for doing so were: (1) I had been assured that provided the work was of the proper quality, I could use as thesis material for a Ph. D. degree some of the work I had done for the ——— Laboratory; and (2) some members of the laboratory staff were interested in having me available as a consultant on those problems with which I had been directly connected. \* \* \* Again, it was necessary that I be cleared."

Mr. G waited for 3 months and was then told he could not be cleared. In February 1947 he wrote a long letter appealing his case directly to the Atomic Energy Commission. Twelve months later he was granted partial clearance for "access to files" to complete his thesis. He has not yet been told whether he can be employed again at an AEC laboratory. In his letter to the AEC, Mr. G wrote, in part:

"The clearance difficulties in which [I] have been involved raise a number of questions which seem to lead to inconsistencies. The telegram which I received from General Groves states that 'apparently there has been some misunderstanding concerning your clearance status.' But if the denial of clearance was really the result of a misunderstanding, why should there have been any question concerning my clearance to go overseas [or to work at the] ——— Laboratory? \* \* \*

"The personal results of [my] security difficulties have been many. [I] have suffered financial loss, personal discomfort, and great personal embarrassment. \* \* \* The implications, moreover, are far reaching in their effect and can quite conceivably prejudice one's status for many years. \* \* \* Since being first employed by the Manhattan District, I have planned to make this field my life work and to go back to work in one of the national laboratories concerned with atomic energy when I have obtained my Ph. D. degree. Now, unless a change in decision is made, this is no longer possible. \* \* \*

"However, the broader implications of the denial of clearance are, of course the more important, far-reaching ones. The fact that a man can be judged without knowing what is held against him and without having a chance to clarify his position is intolerable. A security system based upon such false premises seems entirely incompatible with a democracy. It is only reasonable and just that one should know the facts in his own case and have an opportunity to speak in his own behalf. I should welcome an opportunity to do so."

13. United States Atomic Energy Commission. Interim Procedure (for cases before local personnel security boards). Dated April 15, 1948. 12 pages, mimeographed. Partially summarized in press release of May 20, 1948, which appeared in *Bulletin of the Atomic Scientists*, 4, 1948 (July 1948). (Full text obtainable from United States Atomic Energy Commission, Washington 25, D. C.)

14. White, S. Dispatches on Oak Ridge loyalty hearings, with statements of charges made. *New York Herald Tribune*, May 19, 24, and 29, 1948; editorial, May 20, 1948; letters to the editor, May 27, 28, and 31, 1948, and June 1, 1948. Much of this material is reprinted in *Bulletin of the Atomic Scientists*, 4, 194 (July 1948).

The CHAIRMAN. Senator, it is true that those cases were furnished by the individuals involved, as I understand it.

Senator HICKENLOOPER. I think they were, perhaps, with the consent and cooperation of the individuals, but I was merely attempting to show the American people something about their own business and administrative procedures, and it seemed that I was invading civil rights—I merely call it to the attention of the committee that I have noticed no violent objection to the action of the *Bulletin of Atomic Scientists* when they undertook to abstract those cases.

Now, Mr. Chairman, this morning—this is one of a very substantial number of cases. If we approach these cases as individual cases—I mean, there is a long period of a controversy on each one, if we go through individually each of these cases that have a long period of time on each case, we will be here all summer.

I would, this morning, because I had announced that I would do so, like to go into the matter of the construction of the Hanford Junior High School, called Carmichael School, at Hanford, bearing in mind that this is a reimbursable contract in which the Government reimburses the builder, and there is a cost-plus-fixed-fee item in two or three of the operations.

It is just an example of a number that I went into on explainable costs. Now, the information that I developed on this indicated, first—through Mr. Heller of the joint committee staff—that this junior

high school, Carmichael Junior High School, of Richland, Wash., was originally estimated in the 1949 budget at \$1,786,000. The same figure also appeared in the budget estimate for 1950.

The information Mr. Heller developed through his inquiries for me was that the final cost of the building was \$3,996,000, \$4,000 short of \$4,000,000, on a building that was estimated in the new budget to start, where it ought to be \$1,786,000.

The school was reported to Mr. Heller as being a junior high school for 750 students—I beg your pardon, that is another school.

Then, we checked a little further, and I have this information developed: The high school in question started out, originally started out, with, I believe, well, something less than 100,000 square feet of space, and the information which Mr. Heller finally developed in detail for me on June 16 is that the building finally as completed contains 101,000 square feet of space, and its designed capacity is for 650 pupils, 13 regular classrooms, 15 special-purpose rooms, including cafeteria, auditorium for 700 people, a gymnasium, shops, library, and music rooms.

The actual enrollment on April 27, 1949, was 688 pupils. The original estimated cost was \$1,786,000. The costs as finally developed by Mr. Heller in this last document are \$3,980,000.

This is a reimbursable contract. I am informed that Atkinson-Jones was the over-all contractor, but I do not find Atkinson-Jones' name mentioned in this later information of June 16.

The architect-engineers were J. Gordon Turnbull, Graham, Anderson, Phobst and White, and their lump sum fee was \$68,204.

The construction subcontractor was McNeill Construction Co. of Los Angeles, and they had a fixed fee, as I understand it, on top of all costs of \$60,405.

Now, the overrun on this particular building is over \$2,000,000. It is well over 100 percent of the original; that is, the cost is over 200 percent of the original estimate, which was \$1,786,000, and the final cost being in excess of \$3,900,000.

Now, I submit, Mr. Chairman, that this is merely one of a number of items. As I say, this is one of a number of items which will be cumulative in the long run, but I submit this is an item that is not only difficult for me to understand, but it seems to be a completely inexcusable expenditure of Government money and an overrun that I see no reason for at all, and I will be very glad if there is some explanation for it.

Mr. LILIENTHAL. Mr. Chairman and members of the committee, Mr. Harry Winne and Mr. George Prout, who are vice presidents of the General Electric Co., the Commission's prime contractor at Hanford, and Mr. Shugg of the Commission staff are here; and Mr. Winne and Mr. Prout can supply the facts and circumstances involved in this and in other cases at Hanford to which the Senator may refer.

I think before we are through with this phase of this investigation, I doubt whether this morning is the time, but at some phase in connection both with Los Alamos or Oak Ridge and Hanford, that the committee should hear—perhaps the witnesses this morning can go into this—the special circumstances surrounding the building of facilities for school, for community facilities, and in general the problem of making these sites desirable for the kind of people who are needed for the works themselves.

The Commission, of course, does not authorize the building of communities or community facilities except as they are part of the supporting operation. But perhaps that would come more clearly after some of these particular cases are examined.

I would suggest therefore that Mr. Winne give the committee between now and the noon hour some background on this particular case, and this will probably bring out the general points better than a general dissertation would.

The CHAIRMAN. Mr. Winne?

Mr. WINNE. Mr. Chairman, Senator Hickenlooper, and members of the committee, this high school is one part of a program to provide adequate facilities for the village of Richland in which are housed the workers for the Hanford plants.

Now, in carrying on this operation at Hanford—and this is true, I think, of most of the Commission's operations—a considerable percentage of very high-grade technical people are required, as well as a large number of skilled people in the various production operations.

Those of you who have visited Richland, and I think many of you have, will realize that it is a rather isolated community; that it is a community which was built up on the desert more or less. It is gradually taking the form of a more desirable place to live, and people who have lived there for any length of time, in the majority of cases, are very well satisfied with the location, and like it there. But we have had a considerable amount of difficulty in recruiting the high-grade technical and administrative people which we require there, and one of the inducements which the Commission and we feel, and I think rightly, that it is necessary to offer such people is adequate facilities in the community; that is, adequate schools, adequate so-called commercial facilities, stores, moving picture theaters, and that sort of thing, and adequate housing.

Now, at the time that this school, this so-called Carmichael Junior High School, was authorized and construction started, we could not honestly tell our people that we had at that time adequate school facilities, because we did not. All we could tell them was that they were projected. We were operating in many of the schools on a two-shift basis, with pupils receiving only  $4\frac{1}{2}$  hours of instruction instead of the normal 6.

Senator HICKENLOOPER. Mr. Chairman, perhaps I can shorten this up. I am not raising any question with respect to the construction of the high school. The only objection is why a school which is estimated to cost \$1,786,000 costs \$4,000,000.

Mr. WINNE. Senator, if you will permit me to go along, I will tell you some of the reasons, and they are involved in the matter of speed, and so forth, and I was simply trying to show why we and the Commission felt that speed was necessary, because our schools were overcrowded, and on this two-shift basis, teachers carrying a pupil load on the order of 40, made it difficult for us to get good teachers also. So that this school building, while no plutonium is produced in it, nevertheless it is a part of the whole facility which looks toward the maintaining of satisfactory output of that plant.

Now, the estimate for the school was made by the architect-engineer on the basis of school costs in a normal city, fairly low school costs, at least, as compared to school costs in New York City with which I

am generally familiar, and that estimate was accepted without an extremely thorough review.

Furthermore, it did not—

Senator HICKENLOOPER. Did not the architect-engineer know that the school was to be built at Hanford, Wash.? Did he not know the transportation problems involved? Did he not know the location of the materials that went into the school? Did he figure a Hanford school on a New York basis?

I would think he would have those factors in mind.

Mr. WINNE. Senator, he knew those things but apparently did not adequately weight them, and these factors were not taken—these are some of the factors which apparently were not taken into consideration.

Senator HICKENLOOPER. He got \$68,204 as a fee, according to this report that I have.

Mr. WINNE. Yes, and we do not consider that that fee is out of line with normal jobs.

Senator HICKENLOOPER. It may not be, but he got a professional fee for doing a professional job. Whether it is out of line—

Mr. WINNE. Yes, he did, and the estimate was very low, Senator Hickenlooper; no question about it.

Senator HICKENLOOPER. Therefore, we would have a right to hold him to professional ability and accuracy in making an estimate. Would that not be true?

Mr. WINNE. That is true, but it does not help us any in paying the costs, what the school actually cost, of course. As I say, the estimate was based on too low a fundamental basis. It did not include, as was the practice at that time in making the estimates, the design and construction overhead of the General Electric Co., which was allocated finally to all of those projects on a percentage basis in order to reduce the amount of accounting required. It did not include an adequate amount to allow for the type of site on which the school was located.

The school is on a sloping site, which made it necessary to utilize a number of different levels in the construction of the school.

Now, you may ask why this site was chosen. Well, it was the site at which the surveys made by ourselves and by the Washington State school authorities showed the general location of the school should be in order to adequately serve the population. There was no other suitable site of suitable size in that particular area other than this one on this hillside.

Now, that involved not only additional construction costs—

Senator HICKENLOOPER. Did he not know where the school was to be located when the architect-engineer drew the plan?

Mr. WINNE. He knew approximately where the school was to be located.

Senator HICKENLOOPER. He knew this—

Mr. WINNE. I am not citing this as an explanation for the low estimate. I am citing it as explaining the actual costs of the school which, considering what we have there, we feel, after a thorough investigation not only by our Hanford people but, because of the size of the overrun, by a crew of three people from our General Electric Realty Corp. spend a considerable amount of time at Hanford and made a detailed report on this project, which is available, which

the Commission has, and I presume they would be glad to make it available to you if you desire it.

As I say, this site, the terrain incurred additional costs. Then, also through this same site, there is a large irrigation flue. It was necessary to put that in a steel casing, and it was thought to avoid the possibility of excessive repairs and maintenance sometime in the future, that that should also be encased in concrete. That added considerably to the cost of the school.

The size of the school was increased; the estimate was based on some 86,000 square feet, as I remember it. Actually there was built about 101,000 square feet.

Then again, in utilizing just an average figure of some \$14 per square foot, which, as I understand it, the architect-engineer used in making up his estimate, that would not take into account some of the facilities which were provided to make this a community center as well as a school, such as the rather large, and what would be for a normal school a rather elaborate auditorium with stage and curtains and height for the scenery, and all that sort of thing. Because, you see, we do not have in Richland, other than this school, the normal community facilities which are usually available in a city of that size, and so, in planning this school, we and the Commission felt it advisable to try to make it as much a community center as well as a school.

For example, there is a parking lot for 500 cars. Now, nowhere that I know of, other than there, can you find a school where a parking lot of that size is needed and required, because it certainly is here because this school is used as a community facility. So that all of these things increased the cost very materially above the estimate.

Then, as I say, there is included in the final figure which, according to my figures this is not a great difference at all, but is approximately \$3,800,000, a little less, rather than the \$3,000,000 which you are using—I do not know where that discrepancy comes about, and it is not a very large amount in percentage of the total, anyway—that, perhaps, can be reconciled here.

Senator HICKENLOOPER. There is an item in these last figures, and as I say these were developed by the committee staff for me, presumably from the Commission records—there is an item of reduction or deduction from the \$3,980,000, which is the total cost—there is an item of reduction of \$187,000 for adjustment to indirect costs.

Now, I do not know what that means.

Mr. WINNE. I know what that means.

Senator HICKENLOOPER. That leaves the alleged total of \$3,793,000.

Mr. WINNE. Well, that is the correct figure, Senator, and the reason for that is this: As I say, there is a considerable amount of cost in the so-called design and construction overhead. I can get the details of that if you wish it from Mr. Baker for the whole project. That is the building and operation of the North Richland construction camp, and isolation pay, that is, payment to workers who work at a distance from Richland, of a rate which is higher than the normal rate, and that sort of thing.

Senator HICKENLOOPER. Well, the figures I have here, the figures are the figures that the construction costs with G. E. overhead and distributives show \$37.50 a square foot, as compared to the, I think, \$14.14 a square foot that was the original figure.

Mr. WINNE. Which was used in the estimate, although to that \$14 were added certain percentages.

Senator HICKENLOOPER. Without the G. E. overhead and distributives, the figure I have is \$29.50 a square foot, which is still twice, over twice the amount that the estimate was based on, \$14.

Mr. WINNE. Well, the crew from our General Electric Realty Corp. which investigated the costs on this project, taking out the overhead costs not incurred directly by McNeill, and incidentally, if I may insert there, you apparently received incorrect information, because Atkinson-Jones did not have anything to do with this contract; it was a contract directly between General Electric and McNeill, but against—

Senator HICKENLOOPER. I gave no figures on Atkinson-Jones. That was just a memorandum.

Mr. WINNE. Yes, but I think the record should show that. Taking out the yard work and equipment which ran some \$400,000, overtime premiums, premiums paid for materials, and that sort of thing, in order to get it down more or less comparable to the ordinary production on schools, you might say, or construction our realty people arrived at an estimated net building cost of \$2,467,000, or a cost per square foot of \$24.43, and that compared to schools in New York, ranging up and down from around \$20, so that it is somewhat higher on that basis and, of course, very considerably above the estimate.

Senator HICKENLOOPER. Now, Mr. Winne, I have taken—

Mr. WINNE. I wanted to explain that, if I may, Senator.

Senator HICKENLOOPER. Excuse me.

Mr. WINNE. That reduction from \$3,980,000 to \$3,794,000; that comes about through these General Electric overheads and distributives, which, as I say, include the construction camp and all that sort of thing.

In allocating that to the various projects out there, we have used a flat percentage. Now, that probably results in a book value for cost of this school higher than it should be because this school did not use the same amount of heavy construction equipment and that sort of thing as the other parts of the project. But we have felt, and the Commission has agreed with us, that it was not worthwhile to try to run that down to any finer degree. The over-all money has been spent anyway, and we would simply spend more money in accounting and trying to arrive at a more detailed allocation of those costs.

Now, in first applying that percentage to this school it was applied on top of McNeill's overhead, as well as his direct labor and material costs which should not have been done. That resulted in that \$3,980,000 figure.

Taking out his overhead, and then applying the percentage—it sounds rather complicated—but it is the way of figuring those jobs, that brings it down to \$3,794,000—

Senator HICKENLOOPER. Yes.

Mr. WINNE. Which again is a very large overrun, and is the reason that we sent a team from our G. E. Realty Corp. out there to look into it.

Senator HICKENLOOPER. Yes.

Mr. WINNE. And, as I say, they came back with this report, which indicates that to their minds, in general, we have got what we paid

for, that there was no misuse of funds, no malfeasance or anything like that, that we could find at all.

Senator HICKENLOOPER. I call your attention, Mr. Winne, to a news release of June 14 last, which we were told the other day was a joint news release of the company and AEC, on page 2, in discussing the cost, where it says:

Another Hanford project in which there was a big percentage of overrun was the junior high school where the original estimate was \$1,786,000 and the final cost approximately \$3,800,000. The original estimate was made before designs were at all complete and contemplated a conventional high school of 86,000 square feet of floor area. As finally completed, the school contains approximately 101,000 square feet, and provides facilities to adapt the building for use not only as a junior high school but for many community activities for which Richland did not have other available and adequate facilities.

Then, the last sentence of that paragraph:

Nevertheless the company and the Commission are of the opinion that the costs of school have proven to be high.

Mr. WINNE. That is the reason, Senator, as I say, that we sent this G. E. realty team to investigate because the costs looked high to us. It is a very fine school; it is quite an elaborate school. The Washington State school authorities entered the planning, and included many—caused many of the features to be included in the architectural design.

Senator HICKENLOOPER. I understand.

Mr. WINNE. It is really a fine school. It is a permanent structure, designed to carry on for as long as may be necessary; and some of this cost—and I do not know how much offhand, perhaps Mr. Baker can tell us—is unquestionably due to urgency, to the overtime premiums that were paid, to expressing on material, and that sort of thing, and by hurrying this school along we were able to get by without building a junior high school in North Richland construction camp which the people there wanted very much and were putting pressure on us to build, but by going ahead on this and going ahead without complete designs, again it is one of those cases where construction was right up or ahead of design all the while, we did not have—

Senator HICKENLOOPER. Yes.

Mr. WINNE. That is the reason it was on a cost-plus-fixed-fee contract. Normally if we had time to get complete designs we would have let this on a fixed-price contract, if we could find a contractor to take it that way, and it is quite probable we could have at that time. But the designs were nowhere complete enough, so that any contractor would bid on a fixed-price basis.

Senator HICKENLOOPER. On this information that we developed from the records, it indicates that construction started on May 13, 1948, and the directive completion date for this school was ready for use September 1, 1948.

Mr. WINNE. That is what we endeavored to shoot for, Senator, and we missed it.

Senator HICKENLOOPER. It was ready for use February 28?

Mr. WINNE. That is right.

Senator HICKENLOOPER. 1949?

Mr. WINNE. That is right. That is what we endeavored to accomplish, and it failed. It actually went out into use February 28 of this year, Senator.

Senator HICKENLOOPER. Now, Mr. Winne, I want to call your attention to this: Do you think that it is more costly to get lumber and materials and to build in Hanford than it is in Washington, D. C., or would you have any idea on that?

Mr. WINNE. I do not feel competent to say. I do not know what the costs of building in Washington, D. C., are. I do know that we had difficulty in recruiting labor out there. We had this factor of isolation pay; we had the fact that overtime was used a great deal in order to sometimes speed things along, and other times in order to satisfy the building people, because, of course, with an overtime week they get more take-home.

Senator HICKENLOOPER. Yes.

Mr. WINNE. And even in the East we have had that same condition. We have had to utilize overtime weeks when we really did not need it in order to hold the building trades people on the job.

Senator HICKENLOOPER. Yes.

Now, let me review again just hurriedly, because I want to make some comparisons, that this building eventually was 101,000 square feet.

Mr. WINNE. That is correct.

Senator HICKENLOOPER. Built for 650 pupils. It had 28 rooms, 13 regular classrooms, and 15 special-purpose rooms, including a cafeteria, an auditorium for 700 people, a gymnasium, shops, library and music rooms.

Now, I have undertaken to compare some costs, and I find that the Sousa Junior High School of Washington, D. C., is one of the most modern junior high schools in the United States. It has just been completed. Its estimate, and the amount of the budget for its building was \$1,895,000.

Instead of having 101,000 square feet the Sousa Junior High School has 153,600 square feet. Instead of being built for 650 students, it is built for 1,200 students, almost twice as many. Instead of having 28 rooms, including these rooms, it has 50 rooms, and it has these 50 rooms which include two gymnasiums, instead of one; one auditorium—the seating capacity I do not know, but I presume the auditorium is big enough to take the 1,200 students, so I think it would be fair to say that it has at least a 1,200-seating capacity auditorium.

It has a cafeteria, it has a complete modern central sound system with intercommunication facilities to all classrooms; it has a full community facility for the use of the community as well as for the strict use of the school.

Now, it was built and fully equipped with practically twice the capacity, about 52 percent greater square footage than the one at Hanford, and it was built for \$1,895,000, and completed with its equipment here in Washington.

Now, we developed those figures from the architect, the District architect here, and the comparison is really remarkable to me.

Mr. WINNE. Well, it is remarkable to me because of the extremely low cost which I get from using those figures of about \$12 a square foot.

Senator HICKENLOOPER. Well, the figures are not mine, Mr. Winne. We developed them—

Mr. WINNE. I appreciate it.

Senator HICKENLOOPER (continuing). From the District of Columbia architect, and we asked, "Now, is that all of the cost?"

Mr. PRICE. Senator, are there any real-estate costs involved in there?

Senator HICKENLOOPER. I do not know. We said, "Is that the entire cost of the project? Starting in with the whole ball of wax, and completed, ready to go?" We were told that it did. It was with the community facilities, with two gymnasiums, with the cafeteria, auditorium, with its modern equipment, and, as I say—

Mr. WINNE. Do you know what type of construction was used in this school, Senator?

Senator HICKENLOOPER. I do not know, but they say it is the customary permanent type construction that they have here. I presume it is brick.

Mr. WINNE. I mean it is just inconceivable to me that even knowing as little as I know, and maybe that is the reason, knowing nothing about school costs, that the school could be built in Washington of that size and adequate facilities at \$12 a square foot. I do not mean to question your figures, but it seems to me—

Senator HICKENLOOPER. I am not an engineer.

Mr. WINNE. There must be some unusual circumstance to bring that about.

Senator HICKENLOOPER. But I would suggest those figures came from the official architect of the District of Columbia, from his office, which had charge of these plans. In other words, it looks to me—the building at Hanford, we must recall, on the original estimate was \$1,786,000, which might be considered somewhat comparable to this school, although this school is substantially bigger.

Mr. WINNE. You call this the Sousa—

Senator HICKENLOOPER. It is the Sousa Junior High School in Washington that has recently been completed at that figure.

Mr. HINSHAW. Mr. Chairman, if the Senator will yield a second—

Senator HICKENLOOPER. Yes.

Mr. HINSHAW. It was pointed out by a representative of the General Electric Co. that the basic cost of this school was \$2,400,000, although it actually cost \$3,800,000, and that \$1,400,000, consequently, were spent in overtime and in bonuses and in miscellaneous items, as I understand his reading of the statement. Is that correct?

Mr. WINNE. Well, no, nowhere near all of that \$1,400,000 was overtime and bonuses.

Mr. HINSHAW. Isolation benefits, and so forth?

Mr. WINNE. There were roughly \$750,000 which were the overhead costs allocated to this on the same percentage basis that they are allocated against the production facility built out behind the barricades, and that sort of thing.

Mr. HINSHAW. That was a charge by the General Electric Co. for supervision then, is that correct?

Mr. WINNE. Well, it is much more than just supervision. I will be glad to have Mr. Baker, our controller for the nucleonics department, tell you a little more in detail of what goes into those figures.

Then there was a very considerable expense for taking care of this 60-inch, I think it was, irrigation sluiceway under the school, for new sanitary sewage facilities, which was located under the school, and for various other yard work, and that sort of thing.

Mr. HINSHAW. How much of it was in overtime and in isolation payments, and so forth?

Mr. WINNE. In overtime premiums, it amounted to about \$115,000. I cannot tell you the rest, but perhaps Mr. Baker, if you would care to hear him, can. I think, perhaps, Mr. Baker might go into this whole subject of overhead costs for you, Mr. Hinshaw, if you would like.

Mr. HINSHAW. I would like to know where the difference between \$2,400,000 and \$3,800,000 comes.

The CHAIRMAN. Will you give your name to the reporter?

Mr. BAKER. F. E. Baker.

The CHAIRMAN. What is your official capacity with the company?

Mr. BAKER. Controller, nucleonics department, General Electric.

In establishing a cost-accounting system for the major construction program that began about the middle of 1947, we, in consultation with the Commission decided upon these principles: First, we would account for the direct labor incurred in the construction of each project.

Second, we would account in detail for the cost of materials incorporated in the structure for each one of these jobs.

The other costs involved in this construction program were designated as indirect costs. They included such things as the temporary construction facilities, which include guardhouses, timekeeping stations, movable material shacks, the cost of maintaining and the depreciation of major construction equipment, the cranes, the bulldozers, and so forth; the field expenses, which include employment of people, giving them physical examinations, obtaining security clearance; the cost of the social-security taxes applicable to the wages of those employees; the cost of workmen's compensation insurance applicable to their employment; this item of isolation pay, which is an amount paid to the employee over and above his established rate for traveling to a work area.

The CHAIRMAN. How much did that amount to?

Mr. BAKER. This is approximately for the entire program, \$6,000,000.

Mr. COLE. How do you determine it?

Mr. BAKER. It is determined and set forth in the agreement with the unions under which these workers work at varying amounts from a dollar and a half to \$2 per day.

Senator HICKENLOOPER. Are those items, except the cost of investigation, which runs about \$100 a person, and your policy of isolation pay, the rest of the costs, are they not common? Are they not common to building, whether it is workman's compensation, insurance, and all those things, are they not common to any contractor any place on a big project? There is nothing peculiar about them at Hanford, is there?

Mr. BAKER. I am attempting to answer the question as to how we account for the construction costs at Hanford.

Senator HICKENLOOPER. All right.

Mr. BAKER. The class of costs which I last described was grouped by kind of expense, and no attempt was made during the first few months of the program to allocate those costs to individual pieces of work, individual projects.

The intent was to allocate all of those costs to the individual jobs upon completion of the major construction programs. The exact extent of that program was not known at the beginning; possibly it

still is not. The exact amount of those kinds of costs which would be incurred in total was not known at the beginning.

Senator HICKENLOOPER. Incurred in what?

Mr. BAKER. Incurred in total.

Senator HICKENLOOPER. In total.

Mr. BAKER. Now September of 1948, it was decided to change this practice and attempt to obtain an allocation of this group of indirect costs to individual jobs each month.

For the sake of convenience, and in order to save in clerical work, a simple method was devised of allocating these costs to individual jobs. There are a number of bases used—16 as a matter of fact—and in effect it results in allocating these costs to individual jobs on the basis of the direct labor content of each job. This is a convenient way of doing it, and may not result in an allocation of the exact amount of these costs allocable to any one job.

To determine the exact amount allocable to any one job was thought to require too much clerical at extra cost, whereas the total amount to be distributed would not be affected by the method used in allocating it to any one job.

Senator HICKENLOOPER. Let me ask you: You work for General Electric, do you not?

Mr. BAKER. Yes, sir.

Senator HICKENLOOPER. Does General Electric operate its private business that way, without accurate cost allocations to jobs on projects, or do they just lump the whole thing in a pot and, at the end of the year see how much money they have taken in and see if they can find the money to pay it?

Mr. BAKER. I am sorry if I left the impression that this was an incorrect allocation. We think that it is a correct allocation insofar as being practical in allocating it is concerned. This allocation can in no way affect the total amount of expense incurred.

Senator HICKENLOOPER. That is true. The Government pays the bill, whatever it is.

Mr. BAKER. No; the control of that type of expense comes through controlling it at its source rather than in its allocation to an individual job.

Mr. WINNE. If I may break in, Senator, I think this is an analogy: If in an established plant we are going to build one new building, then we can get very accurately against that one building all the costs that go against it. But if we are building a complete new plant, let us say, consisting of several buildings, as we did at Syracuse not so long ago, then a lot of the allocation of this type of item will be done among the various buildings and facilities in exactly that sort of way.

Mr. BAKER. That is correct.

Mr. WINNE. There, it seems to me, is a point more nearly in point, because we had a lot of construction projects going on all at once.

Mr. HINSHAW. Do I understand that you have allocated \$750,000 to the school building in accordance with that method of allocation?

Mr. BAKER. That is correct.

Mr. HINSHAW. Then, you have an additional \$700,000 approximately to account for in other items over and above the \$2,400,000 that the gentleman stated should be the normal cost of the building.

Mr. BAKER. Part of which was the overtime premium, some \$115,000; premiums paid for materials, \$33,000.

Senator HICKENLOOPER. What do you mean premium paid for materials?

Mr. BAKER. Cost of expediting, getting it to the work site ahead of normal delivery dates.

The CHAIRMAN. What did you do, fly it in?

Mr. BAKER. Yes, and personal expediting of the material at vendors' plants.

The CHAIRMAN. How much of this did you fly in?

Mr. BAKER. I do not know. I do not have that figure.

Senator HICKENLOOPER. Of course, it was not completed on the original directive day.

Mr. WINNE. That is true.

Senator HICKENLOOPER. So that it was not expedited, apparently. According to this report that I have, the directive completion date was September 1, 1948, and it was not—that is ready for use, September 1, 1948, and the actual completion ready for use was February 28, 1948.

Mr. HINSHAW. 1949.

Senator HICKENLOOPER. 1949.

Mr. WINNE. That is true, Senator.

Senator HICKENLOOPER. Some 6 months.

Mr. WINNE. That we did not meet the requested date. We would have been still later if we had not adopted this expediting.

Now, as to what was flown, I am not sure of that, I am not sure whether very much was flown in on this particular job or not. I know a considerable amount was flown in on the 235 project which we talked about the other day, but flying anything in here, I presume, would be some very critical items, and not any heavy, bulky materials, such as bricks, and so on. But without the expedition we would have been farther behind than we were.

Senator HICKENLOOPER. May I ask here—the chairman says that he would like to recess, and I want to cooperate—I would like to ask, was there one contractor who did the entire work on this school?

Mr. WINNE. Well, the McNeill Construction Co. was the over-all contractor on the school. Now he, McNeill, had various subcontracts such as on piping and electrical work and that sort of thing, as is perfectly normal.

Senator HICKENLOOPER. Yes.

Mr. WINNE. In the contracting business, as you well know.

Senator HICKENLOOPER. How much gross was paid to the McNeill Construction Co.?

Mr. BAKER. We cannot answer that question right now because the amount to McNeill includes his payments to his lump sum sub-subcontractors.

Mr. WINNE. Is that what you wanted?

Senator HICKENLOOPER. I want to know how much was paid to the fellow who did this job. I assume that he would pay his subcontractors and be responsible for that, but it is the total amount, unless General Electric or the Commission made direct payments to others than McNeill in the project.

Mr. WINNE. Senator, Mr. Baker apparently is having difficulty in finding that in his figures here. I presume this hearing on some of these matters will go on tomorrow, and we can, if you like, be sure to have this figure for you tomorrow.

Senator HICKENLOOPER. Yes.

Mr. WINNE. I assume, Mr. Chairman, that this particular project or other Hanford items may be the subject of hearing tomorrow; that is, I do not want people to go back to Hanford again, as they did last week?

The CHAIRMAN. I do not want them either. I understand from Senator Hickenlooper that he has three or four matters he wants to inquire about with respect to Hanford, and we will expedite that and clean that up tomorrow.

Mr. WINNE. We will remain on call then tomorrow.

Senator HICKENLOOPER. Mr. Chairman, I would like to talk about and finish this, the river pump house and pipe-line project where a lot of money was spent, and then abandoned; and I would also like to discuss this lumber stock-pile operation which went on at Hanford, and so far as those items are concerned, I think I will leave Hanford then for at least a day or two. I am having trouble getting any understandable data on the whole Hanford situation out there so far as other things are concerned, because the way the books are kept, that is, it is a little different operation from some of the others, and it is not broken down, but if I did go into other things at Hanford, I will give notice.

It is my opinion, Mr. Chairman, and it seems to me to be utterly useless to bring these people from Hanford, fly them over or whatever it is, clear across the United States; it would seem to me on those projects there should be reports within the Commission, reports giving reasons for these things, and those are the things I want to go into.

It seems to me completely needless to bring people from way out there when I think the information should be with the Commission here. The Commission pays these bills, and the Government puts up the money for all these things and reimburses them.

It would seem that the explanation and the details should be in the records readily obtainable here in Washington.

Now, I may be wrong about that.

Mr. COLE. Let me say for the Senator's information, if this inquiry had anything to do with an operation of the National Military Establishment, the people from the Pentagon would come across the river and tell us the story. They would not have to send out to the Pacific coast to get the answer.

Mr. LILIENTHAL. This is a very important difference, and this goes to the very—

Mr. COLE. That may be.

Mr. LILIENTHAL (continuing). Method of operation.

We are trying, as best we can, to have the actual operation of this enterprise which has such a strong industrial flavor, technical and scientific, as much in the hands of American industrial corporations and American scientific and educational institutions as we can.

The only way we can make that effective is to keep the responsibility there as much as we can, and to have these individuals, the very best qualified, to provide the committee with what it is entitled to, that is, first-hand information here.

If this investigation were not regarded by us as the most important matter of business that we have, these people would be at Hanford, and we would give you what information we have here. That is not the way we feel about it.

Senator VANDENBERG. Mr. Lilienthal, that is the question that perplexes me. What is the chain of command in a project of this nature? Does the Atomic Energy Commission authorize the original contract? Do they decide to build this high school? Who decides in the first place to build a high school?

Mr. LILIENTHAL. Well, the Commission—that is, the Commission's management and the Commission decide that upon recommendation, usually from the General Electric Co. in this case, who is responsible for the results.

The General Electric Co.'s judgment that a high school is needed is an appropriate step to take, and then they develop recommendations as to the kind of high school, and these are then reviewed, but we try to keep the responsibility for those matters with the company which is—

Senator VANDENBERG. Excuse me. You say these are then reviewed. Reviewed by whom? By whom, by the Commission?

Mr. LILIENTHAL. By the Commission staff.

Senator VANDENBERG. Commission staff.

Mr. LILIENTHAL. Yes.

Senator VANDENBERG. When and where does the responsibility finally come back to the Commission, (a) for the original contract, (b) for the approval of an overrun on the contract? Does the Commission ever find itself in responsible contact with those decisions?

Mr. LILIENTHAL. Yes. This is by way of report; this is by way of approval of the inclusion in a budget estimate of a project. There are a variety of ways in which the Commission itself is kept in touch with these problems. It is also kept in touch—the Commission itself initiates or is responsible for the degree of urgency put upon various undertakings, realizing that that degree of urgency will affect cost, economy, and so on.

The ultimate responsibility is the Commission's, but the way in which the Commission is kept in touch with developments varies depending on circumstances.

Senator VANDENBERG. Well, who officially decides whether \$1,700,000, a project of that amount, shall become a \$4,000,000 project? Is that the General Electric Co., or is that the Commission?

Mr. LILIENTHAL. Well, that is not the way—what the Commission decides is, or what the Commission approves, its management approves, is that there is a high school needed of a certain kind, and estimates have been provided, which it is hoped will take care of the cost.

Those estimates are provided by the General Electric Co. They are improving this method of estimating. It is obvious that it requires improvement.

I think the important element in all of these decisions as to estimates coming to these particular cases, Senator Vandenberg, is that the Commission made the decision that there was a matter of urgency here; speed was necessary. With that decision went a realization that you could not have a detailed set of drawings, estimates, the way you would carry on a normal undertaking. Therefore, we had to accept the responsibility then for the likelihood that these estimates would not be as close to actual costs as would be the case, say, of the Sousa High School or something else, carried on under different conditions of urgency.

The element of urgency here is as to the schools, example, and was of a piece with the urgency of the plants that we have discussed here, the pressure on the General Electric Co. from its employees and from those whom it was seeking to recruit, which was probably as great in respect to lack of schooling facilities as anything else.

Mr. COLE. Yes; but that did not develop after the first estimate. did it? That urgency existed before the first estimate, I assume.

Mr. LILIENTHAL. That is correct.

Mr. COLE. And the realization that you had to have a little fancier kind of school than in normal places because of the isolation, that realization existed at the time of the first estimate, did it not?

Mr. LILIENTHAL. The condition existed, but it was apparently not given adequate weight.

Mr. COLE. The thing that—that is right; that is the nub of it. Why do you not say that?

Mr. LILIENTHAL. That is what Mr. Winne said.

Mr. COLE. That the first estimate was all wrong.

Mr. LILIENTHAL. Mr. Winne said that.

Mr. WINNE. I said that.

Mr. LILIENTHAL. He did say they did employ a competent architect-engineer, and his first estimate was probably as good as an ordinary architect-engineer would make under any circumstances, because ordinarily they would wait until their drawings were completed, and they would wait and see what they were going to build.

Mr. Winne said, and we certainly said to Mr. Winne, that this original estimate may have been as good as could have been made under the original estimate, but it was an original estimate.

Senator VANDENBERG. I still do not understand about this chain of command, if I can still resolve that, still resolve my own ignorance.

Conceding the urgency, do I understand that having assigned the General Electric Co. to this urgent task, it then becomes exclusively the responsibility of the General Electric Co. to decide how it shall meet the emergency?

Mr. LILIENTHAL. No. We share that responsibility, and we have the responsibility, and there is no way this can be escaped, and we do not try to escape it; but we do delegate to the General Electric Co. the responsibility for carrying out the authorized project, so that the chain of command, Senator, or whatever the places where authority is vested, and responsibility if vested, is something like this: The Commission authorizes a project of several parts of which a school is a part, and authorizes urgency in respect to the carrying forward of that project which includes or certainly carries with it authorization that building shall commence prior to full detailed drawings, and so forth.

Then, the details from that point on are handled in the field, and we get reports, and approve budgets. We have sought to place in the hands of the Manager at Hanford a large part of the Commission's responsibility for supervising the carrying out of this authorized undertaking.

I think the authority runs from the Commission to its field office, thereby to the General Electric Co. under its contract.

Senator VANDENBERG. Is the Commission conscious of the fact that this \$1,700,000 contract is going to run up to \$4,000,000 or there-

abouts in the course of the operation? Is the Commission conscious of that fact?

Mr. LILIENTHAL. The Commission in this case—it is likely the Commission was not, and the Commission field officers are, and I have no doubt its General Manager was.

Senator VANDENBERG. So that the Commission never finally is in a position to exercise final judgment as to whether \$4,000,000 shall be spent or \$1,700,000?

Mr. LILIENTHAL. Yes. In this case that is correct, and it simply goes back to the proposition, I think—at least this is my opinion—that in an enterprise of this kind, the Commission—I should like to say—as distinguished from the institution, must of necessity delegate to management a large share of the authority which it has.

This does not in any way diminish its responsibilities, but it must, of necessity, do that.

The CHAIRMAN. Do you not think, Mr. Lilienthal, that it would be highly desirable if in the event of overruns and overcosts, over original estimates, that there be a requirement by the Commissioners that the Commission be advised of that fact immediately and periodically as the job proceeds?

Mr. LILIENTHAL. Yes; although there are—this, I am sure would be a useful thing to do, but its usefulness would be limited by the fact that the Commissioners cannot do very much about improving a situation where they have authorized the conditions under which it is to be carried out. They can stop the undertaking.

The CHAIRMAN. No; but in addition to stopping it, which would be a very dangerous thing to do, probably, it would be possible to have an inspector general—if you want to call him that—of the Commission to immediately render an independent report to the Commission of the fact that this overrun was taking place.

Mr. LILIENTHAL. This is what was done in the case of the Hanford facilities; a special group of investigators.

The CHAIRMAN. That is what I have in mind.

Mr. LILIENTHAL. But I want to be very candid about this: This operation can be carried on without overrun. The General Electric Co. can get estimates—this is, after all, a great company—and they know how to do business—they can get estimates which will be within a very small percent of the actual expenditures under the ordinary limitations of that expression, and indeed the total expenditures runs within 3 percent of it; but we will have to pay for that in another way.

We realize that, and this is true of all other places: If as a result of, say, criticisms which we make, or criticisms which the General Electric Co.'s internal organization make, you will get an element of caution in here which, under ordinary circumstances would be useful, but you will not get construction started until you have 75 percent of the detailed drawings under way.

The Commission will have this information. We will feel a sense of conservatism—I am not saying this is what you are suggesting, Mr. Chairman, but this is the inevitable course of events, that when overruns are taken, that is to say, where low estimates are taken as an evidence of what a project should necessarily cost, if there is a basis of severe criticism of the company or an agency for having failed to come within an original estimate, people, being human, will

wait until they have detailed estimates. Perhaps, that is what should be done.

The CHAIRMAN. No.; I do not agree, because I can realize and appreciate the necessity for speed, and I certainly was regretful that Mr. Winne said the other day that they were going to change the procedure no matter what the urgency, to see that 75 percent was done. My point is that when these things happen, if we knew that the Commission knew that it was happening at the time and had an independent examination made by a force—for lack of a better word—inspector general, that you would be aware of that fact at the time, and have a perfect record which you could display on request.

Mr. LILIENTHAL. Well, our record would be better, but our meeting the national security requirements would be worse. That is my concern about it.

People, no matter what we do, because of this rather severe criticism of these what are called overruns, will necessarily result in there being an element of caution injected into this enterprise which, if we come into another urgent situation—and your committee has been advised that such a one is in the making—it is just inescapable as long as human beings are what they are, that we will not be much more cautious. We will wait until we have detailed estimates. We ran into this situation—I say this with complete understanding—before the Appropriations Committee, where it was hard for the committee to understand why we made an estimate in respect to a new facility, until the basis for detailed estimates was there.

Now, you would not build a house that way; you would not build a dwelling, I mean. You would not build a commercial establishment that way; you would not know where you are, and this is, I am afraid, going to be very difficult for us, not to proceed with a great deal more caution, and perhaps that is right, but we will pay for it, is what I want to say.

The CHAIRMAN. As long as the money is honestly used, as long as the urgency and necessity of a particular project are established, the fact that an overrun does exist does not disturb me at all. There should be overruns, I think, perhaps, in this business. It cannot be avoided, and, as you say, the price that we might pay for that would be disproportionate, to say the least. I think the point that I want to leave with you is this: That when those overruns are taking place if the Commission itself, instead of leaving it purely to even a good general manager in the installation to O. K. the overrun, was to say to Mr. Schlemmer, if he is the general manager out there, "Well, you have reported an overrun in this school of a couple of million dollars," or which is threatening now, not 2,000,000, it has gone over 500,000, 800,000; we understand that.

It is explicable, it is understandable, and we understand it is a desirable thing to do. I think, Senator Vandenberg, is that your point?

Senator VANDENBERG. Surely. It does not seem to me that it is necessary to involve ourselves in the hazards that Mr. Lilienthal contemplates, the hazards that I would not want any share of, and yet to have a far closer information currently available to the Commission than evidently has been available, and thus a closer Commission responsibility for what happens.

Certainly I am not reflecting on the General Electric Co., which is one of the great institutions of this land, but the General Electric Co. is not the Government of the United States, and the Atomic Energy Commission is, so far as this sort of enterprise is concerned, and it seems to me that when a Member of Congress wants to inquire as to what happened in connection with an overrun of this character, as Senator Hickenlooper indicated, it ought not to be primarily necessary to send to Hanford for the General Electric officials in order to establish the basic facts, because, it seems to me, the Atomic Energy Commission is responsible for the basic facts, and it also seems to me that they have not been intimately responsible for the development of the situations that the basic facts reflect.

Mr. LILIENTHAL. We are getting really down to the kind of fundamental problems we face in your comment. I would like to say this: The reason we rather insist on having the responsible contractor here is what we are trying to do is to develop a sense of that same responsibility for a Government dollar which we ourselves should feel, and one of the ways for the General Electric Co. and the Carbide Co., and the universities to get that is to be right here with the Congress of the United States, with the joint committee, when these things are explored. This is the way to build up that kind of responsibility, because they do not feel that we will become a policing agency rather than one seeking to encourage this company to do the best possible job. This is a fairly fundamental proposition. This is not like, if I may say so, the ordinary contract entered into, let us say, for the building of a bridge in which you build a bridge from A to B, and when you are through, the private company goes out, and that is the transaction which is over.

We are trying to build up something that is between private and public enterprise, as I said the other day, and it helps a great deal to do that to have the University of Chicago and the Argonne National Laboratory director and others, and the General Electric Co. right here while these proceedings are going on, to acquire a greater sense of responsibility.

Senator VANDENBERG. I think that is so, and I agree with you completely, but I do not think it ought to be indispensable.

Mr. LILIENTHAL. It is not indispensable. I think it helps to the extent that these proceedings can be educational, I think it is helpful.

Senator VANDENBERG. Certainly.

Mr. LILIENTHAL. The second concern, the second point I should like to make, because what I think the chairman of the committee and what Senator Vandenberg have said are exceedingly constructive and helpful, is that we should like to have Mr. Schlemmer and some other witnesses—Mr. Schlemmer being the other witnesses—to tell you at another meeting what is being done to improve on these accountability procedures, and a great many things are being done, and I think from these you will see that the direction is in the very direction as has been suggested here by Senator Vandenberg and Senator McMahon.

Senator HICKENLOOPER. Mr. Chairman, may I just call attention to the fact that with respect to notice or information, that the estimate carried in the budget for 1949 was \$1,786,000, and that this same figure of \$1,786,000 was carried in the budget estimate for 1950. In

other words, there was no change whatsoever in those two budget estimates which were furnished by the Commission. I get that assurance from Mr. Heller of the committee staff.

May I just say one more thing. Mr. Lilienthal said something about their becoming a policing agency. I submit, Mr. Chairman, that while I believe that the contractor system of operation has its merits, and I am not opposed to it, nevertheless, I think it is the very function of the Atomic Energy Commission to be a policing agency over seven hundred-and-some million dollars of public funds, and over 400,000,000, let us say, of contract authority.

I feel that there is a definite policing responsibility. Otherwise what would be the use of appropriating these vast sums to the Commission if they are not going to police the general application of the funds to see that they are applied properly and efficiently, and that construction projects in general are carried out in the best interests of public expenditures. To that extent, I think they must be a policing agency just as they must be a policing agency in security and in other matters of that kind.

Mr. LILIENTHAL. I hope there will be an opportunity to discuss this because there is quite a difference of view between us.

Mr. COLE. Mr. Chairman, may I make inquiry of Mr. Lilienthal apropos of this observation that in his opinion it is wholesome to bring these management people, representatives of industry into hearings such as this to impress upon them the importance of the undertaking, and the necessity of the Government's getting a dollar value out of every dollar that is spent, and all that sort of thing?

I wonder if he has that same feeling of wholesomeness with respect to investigations and hearings such as this, so far as impressing upon the Commission itself of the necessity of doing that very same thing?

Mr. LILIENTHAL. To the extent that there are discussions such as of the character we have been having in the last half hour I should say it is extremely helpful, and I am only sorry—after all the committee is a continuing investigating body—that there are not more opportunities with as good an attendance as we have had in these open hearings to discuss in this way for that purpose.

It serves a very useful purpose. There are other things about the investigation that may not be, but I think certainly this is on the credit side.

Mr. PRICE. Mr. Lilienthal, you never at any time have opposed these hearings, have you?

Mr. LILIENTHAL. No, I think my views about the importance of the congressional investigating authority are fairly well known, and over a long period of time. When I said this morning I do not think there is anything that these men could be doing which is more important than what they are doing here, being here and hearing what has gone on at this meeting in the last couple of hours, I meant that literally.

The CHAIRMAN. Well, all right, gentlemen. It is now one-half hour after our time. The committee will meet in executive session at 3 o'clock.

(Whereupon, at 1:30 p. m., the joint committee adjourned subject to the call of the Chair.)

# INVESTIGATION INTO THE UNITED STATES ATOMIC ENERGY PROJECT

TUESDAY, JUNE 21, 1949

CONGRESS OF THE UNITED STATES,  
JOINT COMMITTEE ON ATOMIC ENERGY,  
*Washington, D. C.*

The joint committee met pursuant to call, at 10:45 a. m., in the Caucus Room, Senate Office Building, Washington, D. C., Senator Brien McMahon (chairman) presiding.

Present: Senator McMahon (chairman); Representative Durham (vice chairman); Senators Millikin, Knowland, and Hickenlooper; Representatives Price, Jackson, Cole, Elston, and Hinshaw.

Also present: David E. Lilienthal, Chairman; Sumner T. Pike, Commissioner; Lewis L. Strauss, Commissioner; Gordon E. Dean, Commissioner; Henry D. Smyth, Commissioner; Carroll L. Wilson, General Manager; Carleton Shugg, Deputy General Manager; Frances Henderson, Assistant to the Chairman; Brig. Gen. James McCormack, Jr., Director, and Capt. James Russell, USN, Deputy Director, Division of Military Application; Walter J. Williams, Director, Division of Production; Joseph Volpe, Jr., General Counsel; Bennett Boskey and Everett L. Hollis, Office of the General Counsel; Fletcher Waller, Director, Division of Organization and Personnel; Morse Salisbury, Director, Shelby Thompson, and Rodney L. Southwick, Division of Public and Technical Information Service; Bruce Uthus and Edward Brosnan, Division of Security; Fred C. Schlemmer, Manager, and Lloyd Bergeson, Assistant to the Manager, Hanford Operations Office; all of the United States Atomic Energy Commission.

G. R. Prout, Vice President and General Manager, Nucleonics Department; H. A. Winne, Vice President in Charge of Engineering; and Forrest D. Baker, Comptroller, Nucleonics Department (Hanford Works), of the General Electric Co.

The CHAIRMAN. The meeting will come to order.

Since I arrived at the hearing room, a number of reporters have questioned me concerning a story that has been put out by the International News Service, as I understand it, to the effect that we are investigating "a loss" at Oak Ridge.

We have been investigating an inventory discrepancy at Oak Ridge. This is not the first time such a discrepancy has occurred, nor, I think, will it be the last.

In a manufacturing operation of a complexity not hitherto known, with hundreds and hundreds of the most intricate kinds of operations to be performed, with the tremendous difficulty that occurs in taking an inventory of materials that exist from time to time in the form of gases, liquids, and solids, inventory discrepancies within certain limits are, I think, bound to occur.

The plant at Oak Ridge—the management of the plant at Oak Ridge—has taken great precautions not only to arrive at an inventory as near as it can be arrived at, but to safeguard the installations.

Dr. Zinn of Chicago in his testimony recently enlightened us as to the difficulties they had in maintaining such an inventory. We are getting further education on that subject.

I personally believe that the inventory discrepancy that we have been looking into is not of the kind for the American people to become alarmed about.

Two years ago in September, the Atomic Energy Commission installed a new inventory accounting system. As experience grows with the keeping of this new kind of inventory, it will probably be possible to arrive at more exact results.

Senator MILLIKIN. Mr. Chairman?

The CHAIRMAN. Senator Millikin?

Senator MILLIKIN. Should it not be stated, I respectfully suggest, that the investigation of the matter has not been completed, and that it remains to be determined whether it is really merely a bookkeeping error or whether this is a loss of material?

The CHAIRMAN. Yes, I think that can safely and well be said. We will not close the investigation of any discrepancy until we have become satisfied with the results of our investigation.

Now, Senator, Hickenlooper, have you some further matters to present?

Senator HICKENLOOPER. Well, yes, sir; there are some matters to be commented on, some information to be developed on the high school situation at Hanford that was brought up yesterday. But, first, Mr. Chairman, I have just received the report of the emergency clearances by the Atomic Energy Commission for the month of May 1949, and it shows in the various installations a total emergency clearance at all installations of 115 for the month of May; total clearances with access to restricted data, 115; total clearances without access to restricted data, none.

Again as in other cases, this report is marked "confidential" but there is a summary sheet on the front which has been presented before with the number at the various installations, but not the names of the people nor the dates, and I ask if the chairman would care to consider that it will go into the record.

The CHAIRMAN. Is there any objection?

(The report, referred to follows:)

*U. S. Atomic Energy Commission—Summary report of emergency clearances granted, May 1949*

	Emergency clearances	Access to restricted data	
		With	Without
1. Chicago.....	18	18	0
2. Dayton.....	1	1	0
3. Hanford.....	4	4	0
4. Idaho.....	2	2	0
5. Los Angeles.....	2	2	0
6. New York.....	8	8	0
7. Oak Ridge.....	49	49	0
8. Project Roger.....	3	3	0
9. Project Royal.....	6	6	0
10. Santa Fe.....	3	3	0
11. Washington.....	19	19	0
Total.....	115	115	0

All emergency clearances listed were granted by the managers of operations under authority of GM Bulletin 101. For the purposes of this report an emergency clearance is defined as follows: (a) Clearance of any direct employee of AEC with or without access to restricted data; and (b) clearance of any contractor's employee, prospective contractor, consultant, or employee of any other Government agency, with access to restricted data prior to full FBI investigation. Emergency clearances are granted only after the duties for the job for which emergency clearance is requested have been specified and the clearance specifically states that access is granted only to information required in the performance of these duties. Clearances under the interim security measures for the armed forces, issued May 23, 1947, are not included.

Senator HICKENLOOPER. Mr. Chairman, I think yesterday, among other things, I asked for the total amount of money that had been paid or is to be paid in all categories to McNeill Construction Co., of Los Angeles, which, I understand, is the construction subcontractor on the high school. Those figures were not available yesterday, and I wonder if the General Electric Co. has them today.

**STATEMENT OF DAVID E. LILIENTHAL, CHAIRMAN, ACCOMPANIED BY CARLETON SHUGG, DEPUTY GENERAL MANAGER, JOSEPH VOLPE, JR., GENERAL COUNSEL, FRED C. SCHLEMMER, MANAGER, HANFORD OPERATIONS OFFICE, AND LLOYD BERGESON, ASSISTANT TO MANAGER, HANFORD OPERATIONS OFFICE, ALL OF THE UNITED STATES ATOMIC ENERGY COMMISSION; H. A. WINNE, VICE PRESIDENT IN CHARGE OF ENGINEERING; F. E. BAKER, COMPTROLLER, AND G. R. PROUT, VICE PRESIDENT, NUCLEONICS DEPARTMENT, GENERAL ELECTRIC CO.**

Mr. WINNE. Mr. Chairman, Mr. Baker, our Comptroller for the Hanford Operation, has the figures which, I think, one of the committee members asked for yesterday as the amount paid to McNeill, and also the items which are included in the indirect costs which were given in a tabulation here as somewhere on the order of \$750,000, as I recall it, so Mr. Baker can give you that information.

Mr. BAKER. The information I have was taken from our construction cost accounts last evening, and read to me over the telephone from Richland.

It shows that as of May 31, 1949, the costs of this school paid to McNeill Construction Co. were \$2,495,000.

In addition to this amount, there were costs for labor and material procured by others than the McNeill Construction Co. of \$277,000, and indirect costs charged to the job, such costs being incurred by others than McNeill Construction Co. were \$742,000.

The total of these items represents the actual construction cost booked to May 31, 1949, in the amount of \$3,514,000. Design costs to that date were \$68,000; the total project costs booked to May 31, 1949, were \$3,582,000.

As of May 31, 1949, there were outstanding unpaid commitments of \$141,000, so that the total actual cost, plus commitments to May 31, 1949, was \$3,723,000.

Senator HICKENLOOPER. The estimate that was developed and given to me through the committee staff from the Commission indicates an item book cost—and this has been mimeographed this morning; this

indicates book cost to April 30, 1949, as \$3,898,000; estimated cost to complete, \$82,000; making up the item of \$3,980,000.

Now, there is still the discrepancy there that——

Mr. BAKER. I believe I can explain that, sir.

Mr. Winne made reference yesterday to an investigation of this job which was undertaken by the General Electric Realty Corp. As a result of this investigation, it was discovered that certain items of overhead costs incurred by McNeill Construction Co. had been classified as direct labor costs. The effect of this, as I explained yesterday when I mentioned our method of allocating these indirect costs to individual jobs, was that a double amount of certain of the indirect costs was charged to this particular job. The necessary adjustments were made on the books in the month of May and are reflected in these figures that I have just read.

Mr. WINNE. Mr. Chairman, if we may, I would like to have Mr. Baker also list some of the items which are included in these indirect costs which have been variously referred to in the public press or broadcasts as administrative and supervisory expenses of the General Electric Co. amounting to some \$750,000 or \$760,000, and I would like to have you get a clearer understanding of what items are included in those.

Also there was raised yesterday the question with reference to this item of \$33,000, approximately, covering premiums paid for materials, and there seems to be an impression that the major part of that was for air express, which is not at all the case, and I would like to get a fairer understanding of that on the record, if we may.

The CHAIRMAN. Well, I think that will be helpful because, perhaps, that was the impression which was left with some people, but not with me.

Mr. WINNE. Thank you, sir.

Mr. BAKER. The indirect costs are broadly classified into three groups: One, major construction equipment usage, and this represents the depreciation, plus the maintenance costs, of all of the major construction equipment used in the Hanford construction program. It is allocated to individual jobs on the basis of usage rates.

A record is maintained of the specific pieces of equipment used on a particular job, and the length of time that such equipment is used on that job.

Application of individual rental rates results in charges to individual jobs to liquidate the cost of the equipment and the cost of maintaining it. This accounting distribution has resulted in a charge to the Carmichael Junior High School of \$174,000.

Senator HICKENLOOPER. Mr. Baker, when a man takes a contract to build a building, as a contractor, does he not furnish his own equipment?

Mr. BAKER. In the case of the major construction program at Hanford works, substantially all of the major construction equipment is furnished by the Government to cost-plus-fixed-fee construction subcontractors.

Senator HICKENLOOPER. Yes; that is the point.

Mr. BAKER. But the cost of operating and maintaining that equipment must be charged to individual jobs, as it is used on those jobs. So while——

Senator HICKENLOOPER. I used an illustration yesterday of a high school here in Washington which was costing \$1,800,000, approximately twice the size of this building at Hanford, and I cannot say to you, because I have not checked it, but I think it is a fair assumption, because of the ordinary practices, that the construction contractor is furnishing all of his own equipment, and included in the price of his construction is the depreciation on his own equipment, and an item for the depreciation of that.

I do not take it that the school district of the city of Washington is furnishing major equipment for which a charge would be made on top of that fee or that cost.

Mr. BAKER. Yes, sir; I believe that would be correct.

Senator HICKENLOOPER. I cannot say that is true, because I have not checked that particular item, but I am assuming that is a customary practice, and—

Mr. BAKER. If I might say—

Senator HICKENLOOPER. Yes.

Mr. BAKER (continuing). In this case, McNeill Construction Co. did not furnish the major construction equipment. It was furnished by the Atomic Energy Commission, used by McNeill Construction Co., and the cost of such use was incurred by General Electric and others, and was charged to this job in accordance with the accounting practices in effect.

Senator HICKENLOOPER. Let me ask you, Mr. Baker, was the contract with McNeill Construction Co., was that a cost—

Mr. BAKER. Plus a—

Senator HICKENLOOPER (continuing). A fixed or a percentage fee?

Mr. BAKER (continuing). A fixed fee.

Senator HICKENLOOPER. It was a fixed fee of \$60,485?

Mr. BAKER. Yes, sir.

Senator HICKENLOOPER. That is the item given on this last, that is the source of my information.

Mr. BAKER. Another classification of indirect expense is defined by us as field expense. This includes the following items: Expendable office and engineering supplies, office equipment maintenance, nonproductive salary and wages, employment and termination allowances, patrol and fire protection and security, workmen's compensation and other insurance, social-security taxes, welfare plans, Washington State business tax, first-aid and medical expenses, maintenance of offices and shops, power, light, heat, water and ice, maintenance of roads and railroads.

The third classification is defined as project administration, and includes the following items: Management, reproduction section, procurement, construction supervision, engineering office, lay-out and survey, accounting, timekeeping and pay rolls, general office service, personnel, safety and fire prevention, traffic and transportation.

Mr. Winne has just pointed out to me that I have omitted a number of other distributive costs in addition to major construction equipment usage. They are: Depreciation of shop equipment and small tools, maintenance of shop equipment and small tools, major equipment operators' wages not charged direct to individual jobs, depreciation of temporary construction facilities, warehouse material handling costs.

All of the kinds of expenses which I have listed incurred by each CPFF, cost-plus-fixed-fee construction subcontractors at Hanford, are accumulated in these accounts. They are allocated to individual jobs in total on some 16 various bases, the effect of which is to charge each job with its proportionate share of the total that the labor content of that job bears to the total labor incurred for the construction program.

Senator HICKENLOOPER. So that these extra costs that you are talking about represent the cost of the entire cost-plus-fixed-fee contract program?

Mr. BAKER. Yes, sir.

Senator HICKENLOOPER. And the costs for this high school are allocated in proportion to the labor involved by some formula which you believe is allocable?

Mr. BAKER. Substantially; yes, sir.

Senator HICKENLOOPER. Therefore, the extra costs which I have added over the exact amount which the McNeill Construction Co. and others have received, those are costs then that are properly chargeable to the costs of this high school?

Mr. BAKER. In our opinion, they are.

Senator HICKENLOOPER. And that cost, then, is \$3,000,000—I forget the figure you gave—but the figure is \$3,980,000 gross?

Mr. BAKER. That will come down to approximately the \$3,800,000 after giving effect to the adjustment of indirect costs that I mentioned previously this morning.

Senator HICKENLOOPER. About \$187,000?

Mr. BAKER. \$187,000; yes, sir.

Senator HICKENLOOPER. So that total, after reflecting the indirect cost, would be \$3,793,000, according to this mimeographed report?

Mr. BAKER. That is the presently indicated final cost.

Senator HICKENLOOPER. I see.

Now, on your so-called isolation pay, Mr. Baker, that is paid, is that in the nature of a portal-to-portal or residence-to-residence travel time formula?

Mr. BAKER. I do not believe that I am familiar enough with that situation to explain it.

Senator HICKENLOOPER. Well, who is?

Mr. SHUGG. I can speak to that, sir. When that job was originally set up, the biggest bulk of the technical plants to be built were quite a few miles away from the camp they ran, 20 to 30 miles away from the nearest that we could locate the construction camps. A previous lump-sum contractor, working up in that area on a repeat job, had been paying approximately \$5 a day for the length of time the men had to start out ahead of the 8 hours on the job.

Isolation pay is just a term we gave it because it is not exactly based on portal-to-portal.

When the big construction job was set up, with the cost-plus-fixed-fee work, this amount was the subject of a great deal of bargaining with the unions, and, I believe, we started out with the bulk of the workers getting \$1.50, and two trades got \$2.

I think since, in recent months, that has been raised on the part of those two trades to \$2.50, but the average was close to \$2 per day, representing what was almost an hour of travel time that the men took

to get 20 or 30 miles up to the job. That would not apply to that extent on the high school.

Senator HICKENLOOPER. You say it would take about an hour's time for these people to travel to and from their work?

Mr. SHUGG. Yes, sir.

Senator HICKENLOOPER. I have just been interested in the number of Government workers in Washington who take 40 minutes to an hour to get to and from their work, and I do not believe that they are paid for that time on an isolation theory. Many other people in many other places travel that much going to and from their work where they live at some distance, and I was just interested in the theory of payments of that sort.

Mr. WINNE. Senator Hickenlooper, if I might interrupt for a moment?

Senator HICKENLOOPER. Yes.

Mr. WINNE. That was a necessity as a matter of manning the job, and we have found that that is a practice which exists in many other construction projects where the men have to go from what may be considered as their normal headquarters to any distance.

Senator HICKENLOOPER. It may be a necessity.

Mr. WINNE. I think it was absolutely necessary to man the job.

We did not like it any better than anyone else, of course, because it does represent additional expense to the job, but we considered it to be an absolute necessity.

Senator MILLIKIN. Mr. Chairman, would it interfere with the Senator's continuity if I asked a question?

Senator HICKENLOOPER. No, sir.

Senator MILLIKIN. Is the labor scale there the same as generally?

Mr. PROUT. The labor scale, Senator, is common for labor rates in that area for corresponding crafts.

Senator MILLIKIN. So that the labor scale did not reflect the isolation factor?

Mr. PROUT. No, sir.

Senator MILLIKIN. I think I "dropped a stitch" during the earlier part of your testimony; if I did, you catch me up quickly. The contractor gets paid for all of these allocations of overhead items that you mentioned?

Mr. BAKER. No, sir; he does not. The contractor is paid only for the costs which he incurs directly on the job.

Senator MILLIKIN. His own material?

Mr. BAKER. The material which he incorporates into the work, the labor which he furnishes for the work.

Senator MILLIKIN. Now, who determines the correctness of his allocation formula?

Mr. BAKER. The construction subcontractor does not have any formula for allocating these costs to the job. An accurate record is maintained of the labor costs incurred on the job by an audit of pay rolls; an accurate record is maintained of the material costs, that is, the cost of the material incorporated into the work, through a series of purchase requisitions, purchase orders, receiving reports, and canceled checks.

Senator MILLIKIN. I was thinking of labor and material that are shifted around from one job to another.

Mr. BAKER. This labor charged to any individual job is determined daily by timekeeping records and is reconciled with the gross amount of the pay roll paid to all of the contractors' workers each week.

Senator MILLIKIN. Yes; but who determines the allocation?

Mr. BAKER. I believe it is fair to say that the labor costs are direct charges to the job and not allocated to the job.

Senator MILLIKIN. Suppose you had a traveling superintendent. Who determines what part of his pay is charged to a particular job?

Mr. BAKER. The traveling superintendent would be classified under our accounting system as construction supervision, one of the administrative costs that I mentioned previously, and this allocation to individual jobs is determined by General Electric Co. under a formula that was devised jointly by the Atomic Energy Commission and G. E.

Senator MILLIKIN. So the Atomic Energy Commission participated in setting up the formula?

Mr. BAKER. Yes, sir.

Senator MILLIKIN. What supervisory control did the Atomic Energy Commission exercise in following through the administration of the formula?

Mr. BAKER. A series of reviews of the clerical work carried on by G. E. employees. The General Electric Co. employees make this allocation and distribution in accordance with the formula, and this allocation is subject to review by the Commission people at Hanford.

Senator MILLIKIN. What review did the Commission people give to the matter? What current review did the Commission people give to the matter?

Mr. BAKER. I do not believe I can answer that specifically.

Senator MILLIKIN. Who could?

Mr. BAKER. I believe the Commission could.

Senator MILLIKIN. Coming back now to materials, so far as materials are concerned, which are shifted from one job to the other, who determined the formula for allocating the costs of that material to particular jobs?

Mr. BAKER. The material charges to any one job originate from two sources: First, material which is ordered specifically for a job delivered to the work site, the cost of that material is then charged directly to the job through this series of purchase requisitions, purchase orders, vendors' invoices, receiving reports, pay checks, and so forth.

Senator MILLIKIN. Is there a credit back on the remaining value of the material after it has served its purpose?

Mr. BAKER. I am speaking of the material which is physically incorporated in the work.

Senator MILLIKIN. I am not speaking of that; I am speaking of roving material, of material that you use on several jobs, machinery. You have an electric hoist, for example; you have portable scaffolding; you have dirt-moving machinery.

Mr. BAKER. Yes, sir.

Senator MILLIKIN. Material that you move from one job to the other. Who determines the formula of allocation?

Mr. BAKER. This is classified by us as major construction equipment, and records are maintained by the subcontractor, reviewed by

General Electric as to the period of time that each piece is used on each job.

Then, the dollar value of that usage is determined through these rental rates which I mentioned, that are established to liquidate the cost of the equipment, plus the maintenance of that equipment.

Senator MILLIKIN. Did the Commission participate in these formulas?

Mr. BAKER. These formulas were worked out jointly by General Electric and the Commission at Hanford.

Senator MILLIKIN. What review did the Commission exercise over the administration of the formulas?

Mr. BAKER. To the best of my knowledge, this was done during their periodic reviews of our allocation bases.

Senator MILLIKIN. I am talking about actual inspection in the field as to the use of the particular material.

Mr. BAKER. I cannot answer that question.

Senator MILLIKIN. What percentage of the whole cost is represented by the item that you have mentioned?

Mr. BAKER. Somewhere between 35 and 40 percent of the total.

Senator MILLIKIN. Does that coincide with the usual practice?

Mr. BAKER. It is the average percentage for the individual projects at Hanford. Yes, sir.

Senator MILLIKIN. How about Nation-wide?

Mr. BAKER. I do not have sufficient information to answer that question.

Senator MILLIKIN. Well, out of your knowledge of the subject, the Nation-wide figure is much less than that, is it not?

Mr. BAKER. As a percentage, I do not know. I do believe that a comparison of percentages at Hanford with Nation-wide percentages would require a comparison of the two elements of cost which go to make up that percentage.

Senator MILLIKIN. I understand that.

Mr. BAKER. There is the direct and the indirect.

Senator MILLIKIN. And, of course, it would depend on the kind of jobs that you were talking about, but the contrast may lend perspective on the thing. Would you not say that is a very high percentage?

Mr. PROUT. Mr. Chairman, I wonder if I might answer that question?

Senator MILLIKIN. Sure.

Mr. PROUT. As Mr. Baker has pointed out, percentages are useful for comparison from week to week or from month to month on a particular job for control purposes, but in order to compare percentages in one construction project such as this with a construction project conducted by someone else at another location, it is necessary to understand what elements of cost are included in these indirect charges, and one might appear to be high compared with another because it includes more items.

For example, on an ordinary construction job, there would be no isolation pay, which is included here as an indirect cost. The heavy construction equipment usage might be charged as a direct charge to the job by some construction contractors, where here it is included for a number of reasons as an indirect cost.

Senator MILLIKIN. I think everything you are saying is quite evident.

Mr. PROUT. You see—

Senator MILLIKIN. But if out of other experience you have learned that these items might amount to 15 percent, you have a red lantern for careful scrutiny of something that goes up to 40 percent; that is what I was driving at.

Mr. PROUT. Yes, sir; I understand that.

Now, what we are doing—

Senator MILLIKIN. I am not saying that there is a complete analogy between any two jobs; I am not saying, so far, that the 40 percent or more that you have discussed is excessive. I am trying to get at what supervision ultimately—I am trying to get at what supervision did the Commission exercise as these costs accumulated and mounted.

Mr. COLE. Mr. Chairman, I wonder if the Senator would yield?

Going back to the isolation costs, is it not a fact that there are a considerable number of workmen who live at Hanford or within a stone's throw of Hanford?

Now, the question is: Do those people get isolation wages?

Mr. PROUT. No, sir, Congressman. There are no construction workers who live in the area where the major construction is being conducted. That work has been conducted at varying distances from 25 to 35 miles from the city of Richland, and about 4 miles less than that from the construction camp in North Richland, where a preponderance of the construction workers live.

Mr. COLE. What is the nearest, the shortest distance, where the construction workmen live?

Mr. PROUT. Well, on a major job, somewhere in the neighborhood of 20 miles, maybe 25.

Mr. COLE. How about for this school?

Mr. PROUT. Well, for the school the construction workers in the main lived in the construction camp about 4 to 5 miles from this work. However, in the allocation of isolation pay to jobs, all of the isolation pay costs that were incurred were allocated on a percentage basis, you see.

Mr. COLE. Well, then, the workman gets the isolation pay irrespective of the distance that he lives from the job.

Mr. PROUT. No, sir.

Mr. COLE. Is it measured by the distance that he lived from the job?

Mr. PROUT. They get isolation pay only for work behind the barricades.

Mr. COLE. That is not my question.

Mr. PROUT. Yes, sir.

Mr. COLE. They get isolation pay then no matter what distance they live from their job, whether it is 4 miles or 50 miles.

Mr. PROUT. Yes; that is right. If the work is done—if they are doing work beyond the barricade, that is right.

Mr. COLE. Doing work beyond the barricade?

Mr. PROUT. That is in the barricaded area, the exclusion area.

Mr. COLE. If they work on the nice side of the barricaded area, they do not get isolation pay even though they might live 75 miles away?

Mr. PROUT. That is right.

Mr. COLE. What has the barricade got to do with the determination of isolation pay?

Mr. PROUT. Well, the philosophy under this isolation pay was that it would be paid to workers who worked beyond the barricade.

Mr. PRICE. What is the barricade?

Mr. PROUT. The barricade is the gate across the highway that is the entrance to the exclusion areas where people have to have clearances to go to work. Now, in that area no people have been permitted to live, and, therefore, the philosophy on which this procedure was based was that in an ordinary community people have the privilege of deciding where they will live if they can find a place. Here, they were not privileged to live near the work.

Now, it was a combination of that circumstance plus traveling from the construction camp into the exclusion area that brought about this determination of paying isolation pay.

Mr. COLE. Nobody lives within the exclusion area?

Mr. PROUT. That is right.

Mr. COLE. Behind the barrier?

Mr. PROUT. That is right.

Mr. COLE. This school is not located behind the barrier, is it?

Mr. PROUT. That is true.

Mr. COLE. You said a minute ago that the people who got the isolation pay were only those who worked beyond the barrier.

Mr. PROUT. That is true.

Mr. COLE. And yet this school job is not behind the barrier. Clear it up, will you?

Mr. PROUT. Yes, but all of the isolation pay that is paid to all of the workers is lumped in one sum and all allocated to all jobs for accounting purposes.

Senator HICKENLOOPER. Is any isolation pay at all reflected in the amount of \$2,495,000 that McNeill Construction Co. got?

Mr. BAKER. No, sir.

Senator HICKENLOOPER. Is any isolation pay at all lumped, reflected as actually paid, in the \$277,000 for other labor and materials by others than McNeill?

Mr. BAKER. There may be some included in that figure.

Senator HICKENLOOPER. So that all the isolation pay is included in the \$742,000?

Mr. BAKER. Yes, sir; it is.

Senator HICKENLOOPER. Indirect costs?

Mr. BAKER. Yes, sir.

Mr. WINNE. I think, Senator, it is important to understand that this isolation pay, while allocated to this job, in order to simplify the overall accounting, allocated to all jobs, very little of it was actually incurred on the school job, so to that extent, the costs are, you may say, overstated in that one item.

Senator HICKENLOOPER. Well, it would seem to me, by the same token, that the costs are increasingly questionable because no isolation pay is reflected in the \$2,772,000 cash for this building that was paid in the two items to McNeill and the labor and materials furnished by others. They would not include any unusual pay for the workmen. That gives a total of \$2,772,000, as I get it, exclusive of the \$742,000 that are reflected in these other charges.

Mr. HINSHAW. Mr. Chairman.

Senator HICKENLOOPER. That would compare, using the comparison of yesterday, with a building twice as big here in Washington and approximately twice as many students for \$1,800,000, and that is not even

considering the \$742,000 service charges of various kinds referred to as indirect costs.

Mr. WINNE. Well, as I remarked yesterday, when we had a team of three people from the General Electric Realty Corp. make an investigation of this cost, because it appeared high to us, they tried to separate out as well as they could the items which they felt were incurred because of, shall we say, the peculiar construction conditions at Hanford, and separating those out, they arrived at an estimated net building cost, as I think I mentioned, of \$2,467,000, or approximately \$24 per square foot. I would like to read to you a paragraph from their report with reference to that which, I think, may be of use in this record:

Although construction costs of schools vary greatly depending upon the requirements, information obtained indicates that costs of typical schools in New York State where labor rates are reasonably comparable to those at Hanford, have run in the neighborhood of \$20 per square foot, and \$1 per cubic foot. Although the costs of the Carmichael School are somewhat higher, a part of this additional cost undoubtedly resulted from certain of the items incorporated in the design which have been mentioned previously. The cost of these items in comparison with other facilities could be determined only by a detailed analysis and comparison. In addition it appeared from observations made during our review that the efficiency and production of construction labor was lower than that of similar labor in New York State. The lower labor efficiency would, of course, contribute to additional costs. In our opinion, these two factors account for at least the major part of the excess of the costs of the Carmichael School over that of a typical school in New York City.

Now, as I said yesterday, this school is a very fine school.

Senator HICKENLOOPER. What is the construction type, incidentally? What is the material, I mean?

Mr. WINNE. Well, it is a concrete block wall, as I recall it, with steel framing, but as I said, it is on a sloping hillside which, with a difference in elevation, the floor and other lay-outs are cut up by the changes in the elevation, the lay-out of the north wing, with a single row of classrooms requiring a large amount of wall and corridor construction in relation to the floor area.

Another item is the use of high ceilings with monitors and side lights for the corridors, overhang eaves for the monitor roofs, a head room of 27 feet 6 inches in the auditorium, and 53 feet in the loft for handling scenery, extensive refinements of interior finish, with built-in equipment and glazed tile, systems for supplying filtered and washed air to the rooms, and an item which will greatly decrease maintenance costs in the future, the use of pipe tunnels along the exterior walls to facilitate the installation and maintenance of steam and water piping.

Now, looking back with hindsight, this design, in my opinion, is somewhat more elaborate than is needed for that school. Probably you may say that the General Electric Co. should have caught that in the design stages, and looking back with hindsight we can say the same things to ourselves and criticize ourselves for not doing it.

Of course, at this same time we were carrying on a construction program of important production facilities many, many times in volume of the school item, and so that it probably suffered in supervision as compared to the important production facilities, and if we were doing this alone, I think we could make—doing it over again—we could make a considerable reduction in costs. We must admit that.

Senator HICKENLOOPER. Yes. I think, without passing any judgment on that testimony at the moment, it might well pose the question as to whether the system of operation there in construction should have a revamping and a different approach to the various construction problems.

Senator KNOWLAND. I would like to ask if the cost did not include the equipment of the school other than, as you have mentioned, I mean desks and——

Mr. WINNE. Yes; the cost includes the school completely equipped, Senator Knowland.

Senator KNOWLAND. Ready for use?

Mr. WINNE. Ready for use, and it is in use.

Senator MILLIKIN. Mr. Chairman, may I ask a question?

The CHAIRMAN. Certainly, Senator.

Senator MILLIKIN. I am trying to establish the relationship of the Commission to what we are talking about. Were the blueprints and the changes in the blueprints approved from time to time by the Commission?

Mr. WINNE. Yes, I think that is correct, Senator. Of course, the Commission looked to us as the prime contractor at Hanford to be responsible to see that these things were right, as well as we could, but they did also look over the drawings and specifications. I think I am correct in that, and approve them as is required by our contract with the Commission.

Senator MILLIKIN. From time to time?

Mr. WINNE. I think that is correct. It is my understanding that that was the case, Senator. I was not right there on the job myself to see that.

Senator MILLIKIN. What did the Commission have, inspectors, other inspectors on the job?

Mr. WINNE. Perhaps one of the Commission men, familiar with the operation at Hanford, should answer that, Senator, rather than myself. I cannot tell you from my own personal knowledge.

Mr. SHUGG. Senator, we had an office charged with the complete supervision of design and construction which at the time I left there was about 35 people. That did include everybody in the office, and the field inspectors.

It was a small group, but there were roving field inspectors not tied down to any one spot, who did have the opportunity to look at anything and did have the chance to find out as much as they were smart enough to find.

Senator MILLIKIN. As distinguished from roving inspectors, were there any inspectors attached to this high school?

Mr. SHUGG. We had the field staff split up between a certain area in the technical plants and another area, and a third area involving community work. That was the nearest assignment. We did not have people—we did not have enough of them—to follow each building and each job. The General Electric, in the first place, had people, and in some cases, the architect-engineer had people under them in order to see that their plans were carried out, and then the contractor had—there were about three layers already, sir, and ours was a very light check over that.

Senator MILLIKIN. But you had someone in charge, charged with the inspecting of all of these operations at Hanford?

Mr. SHUGG. We had an office, a total office of 35 people, which was responsible for exercising our end of all design and construction.

Senator MILLIKIN. Did that office make any reports at any time on any of the matters that have been discussed here as to possible over-elaboration of design?

Mr. SHUGG. Yes, sir; plenty—the life in those days was just one continuous discussion of a whole lot of things that were in disagreement. We had plenty of disagreements and plenty of times we were wrong, and sometimes the contractor was wrong, and it was a very busy time of arguing over this job from all angles.

Senator MILLIKIN. Did those matters come into the Commission here in Washington?

Mr. SHUGG. Sometimes they did, sir. On a couple of occasions, when we had too big a package piled up, it came to Washington, and we had Commission meetings on it. We had one early in November of 1947; we had at least one in January, February 1948, and we have had several since.

We had a 2-day session here February 19 of this year; that is, a stock taking and a review, and a mutual exchange of ideas and to see if we can do it better.

Senator MILLIKIN. Did the staff at Hanford have any comments to make on the method of allocation of costs of the type which we have been discussing?

Mr. SHUGG. Well, I can say that I myself have always felt that in taking the over-all management and field expense and equipment costs for a job of that type out there, where the bulk of it is of a complex, highly technical nature, means that the total of those overhead costs is high—and I think justified to a very large degree for that type of job.

Now, you have thought that taking that and applying the same percentage for something simple down in the town as is applied to a highly technical plant up beyond the barrier, does not put the best foot forward on the job down in the town; but to try and make two or three scales, two or three percentage scales in order to only put on the town as much as can be figured for the town, does not save any money. It would not save a dollar. It would mean that as much as you lighten the town job, the extra would go on a plan job, so it would not save any money and, at the same time, it might cost some money in further complication of the bookkeeping. So I agree——

Senator MILLIKIN. Although the total might not be lessened.

Mr. SHUGG. Right, sir.

Senator MILLIKIN. But the basic question is whether the allocations are correct, whether they are overweighted.

Mr. SHUGG. I definitely think that it results——

Senator MILLIKIN. What was the rate of depreciation on roving material? Take a bulldozer, take any item? Did you follow the standard practices on that?

Mr. SHUGG. Yes. I do not know it personally, but I believe it will be found that the rates of depreciation on the heavy equipment are based upon its average life under that heavy usage.

Senator MILLIKIN. I mean, there are certain standard practices for tax and other purposes; certain standard practices of the trade——

Mr. SHUGG. Yes, sir.

Senator MILLIKIN (continuing). On what should be the percentage of depreciation of, we will say, bulldozers.

Mr. SHUGG. Yes, sir.

Senator MILLIKIN. Were those followed or were they exceeded?

Mr. SHUGG. I cannot tell you personally that I compared those, but I have confidence in the people, and we have some pretty practical men, too, who helped set that up. We have one man who specializes on that.

Senator MILLIKIN. I think it would be useful to know what their opinion was. Can any of these gentlemen tell us?

Mr. BAKER. Yes sir; I can answer that question, Senator. The rental rates that are used by us in allocating the cost of major construction equipment usage are based on those which are used by the trade in general.

Senator MILLIKIN. I am very glad to have that information. Thank you for it.

Now, were these various matters that we have just been talking about, so far as questions that came up among the members of the local staff at Hanford, who were there representing the Commission, were those matters passed on to the Commission? Or were they decided on the ground without reference to the Commission?

Mr. SHUGG. There were a lot, sir, that had to be decided on the ground, and we should have decided, and did decide.

It was only those that we could not handle that were brought higher up, and those were more in the nature of a general stock-taking and a general tightening up, and oftentimes in connection with being behind schedule, too.

Senator MILLIKIN. Now, what action was the Commission taking to see that the questions which should have been referred to it were referred to it? Did the Commission send anyone out to check what you were doing there locally?

Mr. SHUGG. Well, sir, there were some times when I thought that there was a pretty steady parade of Washington staff people out there. Now, there were not enough Commissioners to come there all the time.

Senator MILLIKIN. Were they on parade or were they there for a purpose?

Mr. SHUGG. They were there to find out what we were doing, and I know I can speak definitely that they did find out plenty. I can speak of the fact that in one project later on there was a very major change which was made as the result of one of those visits.

Senator MILLIKIN. Was it systemized supervision of what you were doing there, or sort of a "shooting from the hip" operation? Did they have people come out at regular times with a regular mission, or did sightseers come out and engage in general "yak-yak" on the subject?

Mr. SHUGG. No, sir; we had a very regular group of visitors there who took over construction out on our job, and not only these staff people but the Division Director. It is a general question to answer, Senator, but I do not think we suffered from Washington interest.

Senator MILLIKIN. Then, you would say as a result of everything that you have said that the Commission here was thoroughly informed and if there were any mistakes there, they are directly attributable to the Commission?

Mr. SHUGG. I would say, sir, that as far as we could in the field we informed the Commission of those things that we did not think

we could handle ourselves. I will say that I did not hand out any more than I could handle.

Senator MILLIKIN. Let me ask you my question again: You have detailed now the direct knowledge of the Commission of what was going on out there through this parade of people that were constantly there. Would you give it as your opinion that the Commission was so thoroughly informed that it has complete responsibility for the result, whether good or bad?

Mr. SHUGG. I would not say, sir, that the Commission had complete responsibility—I was responsible, while there, for anything under me. That was definite; what the manager in the field failed to do, I think, the Commission would know about and would know what was going wrong or right in the manager's job as a whole. What happened below me, sir, did not get up to the Commission if I could help it, if I thought I could handle it.

Senator MILLIKIN. Well, I repeat my question: Did the Commission have enough information on what was going on there so that it would be fair to say that it not only was theoretically responsible, which it is for all of these operations, but that it had enough actual knowledge of what was going on to be held to actual responsibility?

Mr. SHUGG. I would rather not answer, sir, as to whether they had sufficient knowledge because I certainly would involve myself then in my own judgment as to whether I passed up enough.

Senator MILLIKIN. But you do not detract anything from what you have said as to the frequency of Commission inspections?

Mr. SHUGG. Washington staff?

Senator MILLIKIN. Yes.

Mr. SHUGG. No, sir.

Senator MILLIKIN. All right.

The CHAIRMAN. May I ask a question of Mr. Winne?

Mr. Winne, you stated the other day that the General Electric contract was subject to a reaudit at the conclusion of your general contract by an independent firm of certified public accountants. Would this item of the high school come within the purview or the intent of such a post-audit?

Mr. WINNE. No, Senator McMahon. The item in the contract which is subject to that audit by a firm of certified public accountants, acceptable to the Government, is this \$200,000 per month administrative fund against which we charged such expenditures as we incur in connection with this contract, which are not directly reimbursed at either Hanford or the Knolls.

The item such as the actual expenses of operation and contracts and so forth which are reimbursed right at Hanford or the Knolls are, of course, available for the Commission's staff at those places to audit at any time, but so far as I know, no outside firm of accountants is called in.

The CHAIRMAN. Thank you.

Mr. HINSHAW. Mr. Chairman?

The CHAIRMAN. Mr. Hinshaw?

Mr. HINSHAW. In this operation at Hanford, is there any separation in the General Electric Co.'s handling of construction projects within the barrier and without the barrier, or are they all handled through the same office?

Mr. WINNE. I think Mr. Prout can tell you that.

Mr. PROUT. They are all handled through the same office.

Mr. HINSHAW. Mr. Chairman, that is in contradistinction to other locations of the AEC where there is a town management group which is responsible for the community facilities, including schools, roads, sewers, and other community facilities.

It would appear that through the convenience of allocation of funds, that the same kind of an allocation is made to town facilities as is made to construction within the barrier. I rather believe that if we were to separate the two, that is, the town management as one item, and facilities within the barriers as another item, that we would find an entirely different overhead charge on the town management.

I will ask Mr. Winne if that is not correct?

Mr. WINNE. In my estimation, Mr. Hinshaw, that is quite possible, because, as Mr. Baker pointed out, the indirect costs are allocated as a percentage of direct labor, by and large, and it is quite possible that in that item there is an overcharge on the high school which should have gone against some of the production facilities if you could accurately separate those items and take the time and expense of accounting to do it.

Over all it would not save the Government a dollar, as I see it. In fact, I think it would cost the Government several dollars for the additional accounting, and so forth, required to do that job.

Mr. HINSHAW. Well, as a matter of fact, Mr. Winne, there is very little if any isolation pay, for example, in this high-school project.

Mr. WINNE. That is true. There is very little actual isolation pay paid on the high-school job.

Mr. HINSHAW. And yet something—

Mr. WINNE. Although in distributing the indirect costs the same percentage is applied to the direct labor—the same percentage of indirect costs—as on the other jobs, so that it unquestionably has in that particular item of isolation pay more charged against its book costs than was actually incurred on it.

On the other hand, that isolation pay was actually paid out, and if it did not appear against the school, it would appear against one of the production facilities, so again there would be no net saving to the Government and, as I pointed out a few days ago, the over-all record on the over-all construction job there involving some \$230,000,000 is an overrun of only about 3 percent, so that the performance over-all is, I think, excellent.

There are individual items where the costs have overrun considerably, such as on this school, overrun the estimates considerably, such as on this school and on the project we discussed the other day.

Mr. HINSHAW. I call attention to the fact that when an item from the AEC is sent into a budget for the Congress in the amount of \$1,700,000 or \$1,800,000 for the construction of the school, that it either places the Commission in a false light or else provides a false guide for the Congress in making the appropriations.

We had no way of checking as to the cost of such a project if costs are included in the final cost which are not actually a part of the cost of construction and supervision.

Mr. WINNE. It is true that there are some inaccuracies there, Mr. Hinshaw, but again it is a question of whether the game is worth the candle. It is a question, that is, of whether we should spend the money and the time to endeavor to get a single item out of a major

construction program allocated its share of this indirect expense with extreme accuracy when over all doing it that way does not, as I say, save a dollar, and it would actually cost dollars in accounting and so forth to do it.

Mr. HINSHAW. I realize that the totals——

Mr. WINNE. I realize the effect on your budgeting and so forth; I can well agree with that.

Mr. HINSHAW. There is no way possible for the Congress to understand what is going on and to make an appropriation of funds unless we know what things are going to cost approximately.

Mr. WINNE. That is true. But, of course, I think the inaccuracy is not very great. I do not know what amount is included in this particular school cost item to cover isolation pay. Do you have that?

Mr. HINSHAW. About \$100,000, as I remember the figure given.

Mr. WINNE. Well, there was about \$100,000 for actual overtime, but Mr. Baker says around \$100,000 is fairly close for the isolation pay, in addition to the overtime.

Mr. HINSHAW. Yes, but from the standpoint of the Congress and the budget of the Commission submitted to the Congress in its Appropriations Committee for the purpose of making appropriations, it is a very impractical guide.

We have no way of judging whether or not the amount requested is going to cover the amount finally expended. In other words, we are off some 40 or 50 percent because while the contractor actually paid out something in the neighborhood of \$2,000,000 or \$2,400,000, these other costs add something like 40 percent to the bill.

I would like to know how anyone can expect the Congress to properly appropriate funds for the Atomic Energy Commission unless it has some reasonable statement made to it beforehand as to what actually is intended to be expended for that purpose.

Mr. WINNE. This is a very good question, and we want to give you the best estimates that we can of any of our projects.

As I said yesterday, the estimate on this school was admittedly altogether too low.

Now, the inclusion of this isolation pay of \$100,000, is not a very large percent of the total, and it does not by any means account for a large part of the overrun, as you well know.

Mr. HINSHAW. But the total allocation from the Commission of about—from the General Electric Co. of about \$1,400,000 completely changes the picture as far as costs are concerned. It is not \$1,700,000 or \$2,400,000, it is \$3,800,000, or some such figure as that; and, of course, we cannot appropriate on that kind of a basis.

Mr. WINNE. Well, but my point is, Mr. Hinshaw, that the \$2,400,000 in itself is over the initial estimate, that is, our initial estimate, the estimate made by the architect-engineer, which was way too low, and there is no question about it.

Mr. HINSHAW. Yes, but as stated by Mr. Baker a few moments ago, that \$2,400,000 does not include the use of heavy machinery and a great many other items.

Mr. WINNE. That is right.

Mr. HINSHAW. Which you placed on the job and which should be charged to direct costs.

If those direct costs are separated from the \$1,400,000 that General Electric spent and applied to the cost of the school, it is going to run considerably over \$2,400,000, is it not?

Mr. WINNE. Yes.

Mr. HINSHAW. So that in order to arrive at any kind of a figure, whatever that will be, of any sort of a guide as to whether expenditures are being properly allocated and made, we should know what all of the direct costs are that are involved in the project, and what the indirect or supervisory costs are.

Mr. WINNE. It would be desirable from the standpoint of getting an extremely accurate cost of the construction if we had that. As I say, we did not do it because we had this whole major construction program.

This, while in itself is a large item, is less than 2 percent of the total construction program we were carrying on.

Mr. HINSHAW. Let us multiply this school by all of the different schools that go into all the projects of the AEC, and supposing they come in with a budget of \$1,700,000 per school, and there are 10 schools, and it ran \$1,400,000 or \$2,000,000 over on each one of the 10 schools, we would have \$20,000,000 involved in a budget item.

Mr. WINNE. That is correct.

Mr. HINSHAW. And, of course, we just cannot appropriate that way, and the Congress, so far as I can see—it is an impossibility for us to make any kind of an estimate because then the Commission would have to come in to us and say, “We have a deficiency which we desire to obtain in order to make up the cost of these facilities.”

Mr. WINNE. That is perfectly true, but the point that I want to make is that this total overrun is not due entirely or in large part, indeed, to the indirect costs allocated to this job. They are a very substantial item, but they did not account for the total overrun. It comes back again to the fact that the estimate was too low for the type of building which was actually built.

Mr. HINSHAW. I recognize that, and I recognize also that the overall appropriations for the entire Hanford project would be no different, whether the overrun ran one place or another.

Mr. WINNE. That is right.

Mr. HINSHAW. But, on the other hand, in order to justify the budget of the Commission, some more reasonably accurate figure must be had, both as to direct costs and as to indirect costs.

Now, at the present time we will find that the overhead charged to the construction within the barrier is too low; hence, those costs are not high enough because some of those costs have been charged to a school and, perhaps, to other projects that are on the job there. I do not know what percentage of the total budget of G. E. is applied to projects inside and projects outside the barrier, but if that rate is to apply for all the projects outside the barrier, then those costs are obviously too high and the costs within the barrier are correspondingly too low. Is that not correct?

Mr. WINNE. I think that is correct, Mr. Hinshaw, that on jobs like this school the indirect charges, including this isolation pay, et cetera, are probably somewhat too high, and that, correspondingly, the costs of the work behind the barriers are somewhat understated, but, again, it is not a large percentage.

Now, perhaps, for your work, getting your budgets, and so forth, perhaps we will have to work out with the Commission a different method of accounting and allocating such costs in the future.

Mr. HINSHAW. That is all, Mr. Chairman.

The CHAIRMAN. Mr. Elston?

Mr. ELSTON. Just one question, Mr. Winne. Do the workmen who receive this isolation pay, pay for their own transportation?

Mr. WINNE. Perhaps Mr. Prout can answer that.

Mr. PROUT. Some of them do and some do not. Bus fares are collected on some proportion of the workers who go into the area to work.

Mr. ELSTON. Under what circumstances are fares collected and under what circumstances are they not collected?

Mr. PROUT. I am unable to answer that question. I am sorry.

Mr. ELSTON. Do I understand that in some cases the Commission furnishes transportation free?

Mr. SCHLEMMER. May I make an observation in that connection. The situation is that busses are provided to take employees into exclusion areas. In cases where employees enter those areas, they are transported by bus for which they pay a fare of 5 cents.

In connection with certain of the workers on construction work, they are permitted to enter the area within their own vehicles. These are not exclusion areas.

Mr. ELSTON. Did the workers on this high school building, who received isolation pay, pay their own fares or not?

Mr. SCHLEMMER. The workers on the high school building did not receive isolation pay. They paid their own fares to that project.

As Mr. Winne explained, no isolation pay was paid to construction workers on the high school, but in the allocation of indirect charges, which are made against all projects, both those in exclusion areas as well as those in the community areas, the isolation pro rata was charged against that project.

Mr. ELSTON. That is all.

The CHAIRMAN. Senator Hickenlooper?

Mr. SCHLEMMER. May I make a further observation in connection with Mr. Hinshaw's observation on budgeting and allocation?

The total funds authorized and obligated by the Congress up to and including June 30, 1947, amounted to \$345,000,000. That covers all of the projects of any nature at Hanford.

The presently estimated final costs applicable against those appropriations and obligations are \$335,000,000, or a favorable difference of \$10,000,000 in the case of the total Hanford project.

The CHAIRMAN. Senator Hickenlooper?

Senator HICKENLOOPER. Mr. Chairman, with respect to the last remark, I think that it may become apparent that the philosophy of operating this project is to stay within the budget rather than to operate with a degree of efficiency that good business practice would dictate. In other words, if one stays within the budget, then everything is all right, because we have been appropriated that much money and if we do not spend more than we were appropriated, we are doing the job. I am afraid that philosophy may gain some support in these matters.

So that the fact that a person does stay within his budget would not necessarily be an answer to efficient operation.

Mr. SCHLEMMER. Senator Hickenlooper, that does not happen to be the philosophy, and my observation was directed only to Mr. Hinshaw's point regarding funds appropriated and funds spent.

If I may also, Mr. Chairman—

Mr. HINSHAW. I would like to point out that I was referring only to a high school. I was not referring to the entire project, and the gentleman cannot deny that the high school cost a great deal more than it was budgeted for.

Mr. SCHLEMMER. That is correct.

Mr. WINNE. Senator Hickenlooper, I would like to point out, if I may, that it is not our operating philosophy simply to stay within the budget. We are trying to run that job as we run any of our own jobs in our own commercial works, trying to obtain the same degree of efficiency, the same safety, the same improvements in operation which, if time permits, sometime today or some other time, I would like to bring to your attention, as to the improvements, reductions in operating expenses, et cetera, that we have made in the operation of this whole project, including not only the operating facilities but the town as well; because, as I think Mr. Hinshaw brought out, contrary to the practice at two of the other sites, we are responsible at the present time for not only operating the facilities, but the village of Richland as well.

Senator HICKENLOOPER. I will say, Mr. Winne, that from time to time I have been on both sides of the operating expense theory at Hanford. There was a time when I thought that the operating town site expense at Hanford was very, very efficient indeed in comparison to some of the other towns that were being operated by the Commission.

I tried to get into that and found that, at least so far as any information that the staff could develop—found that the accounting system is such that it is difficult to isolate these matters, and I have been unable to find any information on an accurate determination of town operation in Hanford, because it is all operated as one unit, and out of the same offices and charges are allocated to this project and charged to that project, and so on, in a way which I feel makes it very, very difficult to evaluate the activities of Hanford outside of the highly technical areas and operating activities.

I am not saying that it is inefficient or that it is efficient at this time, because I still feel that there is no comparable yardstick available, at least to a complete laymen in those things, that will furnish a basis for comparison as, for instance, between Hanford and Oak Ridge and Hanford and Los Alamos.

I do not raise that particular question at the moment.

Mr. WINNE. May I just make a short statement on that point?

I think your remarks are quite correct as directed to the condition a year or so ago. The expense of operating the town was in many respects intermingled with the expense of operating the plant, but during 1948 we have segregated the operations and the accounting, and so forth, for the village, so that we are now in a position to know very definitely what the operations of the village are costing as distinct from those of the plant; and, so far as we can find, they compare very favorably with the other Commission towns.

The Commission is in much better shape to speak on that than are we.

Senator HICKENLOOPER. I would like to mention two other matters.

Mr. PRICE. Mr. Chairman, before we go to another matter, I would like to ask something on this.

Senator HICKENLOOPER. Excuse me.

The CHAIRMAN. All right, Mr. Price.

Mr. PRICE. Mr. Winne, during what period was this project under construction?

Mr. WINNE. I cannot speak of my own knowledge, but Mr. Baker and Mr. Schlemmer tell me about April 1948, and we moved the children in the 1st of February 1949, Mr. Price.

Senator HICKENLOOPER. The date on this mimeograph we have here shows construction was started May 13, 1948.

Mr. PRICE. What were the general conditions in the construction industry during that period as to cost of production on various jobs throughout the country?

Mr. WINNE. I do not think I am competent to speak on that, Mr. Price.

Mr. PRICE. Had the General Electric been engaged in any construction programs of their own during that period?

Mr. WINNE. Very definitely; yes, sir.

Mr. PRICE. Do you know anything about their experience in overruns?

Mr. WINNE. Some, yes. I know we have had a great many of them during the whole postwar construction period because of rising labor and material costs, and in some cases they have been very material overruns.

Mr. PRICE. Can you give us any idea about how much they amounted to?

Mr. WINNE. Well, I can recall one rather large project on which the final cost was more than double the original estimate. Now, there was an intervening period of time of a year or so in there in which there were rising material and labor costs, of course, which very largely accounted for that.

Mr. PRICE. So that, in addition to the circumstances that were peculiar to this Carmichael High School project, there were other economic conditions that entered into the overrun.

Mr. WINNE. I think there were labor increases during the course of the construction.

Mr. BAKER. Yes, sir.

Mr. WINNE. During the course of construction of the high school there were some labor increases.

Mr. PRICE. Of course, Mr. Chairman, I could fill the record with examples of this in both private construction projects and from records of our armed services on different projects, but I do not see the advisability of doing so, since I think that the Commission and General Electric have given an adequate presentation on the cause of the overrun at Hanford.

During the past few days, Mr. Winne, we have been talking almost exclusively about the Carmichael High School, and a few days about the U-234-235 facilities. I wonder if you could tell us something about what the General Electric and AEC have accomplished out there in the past 2 years?

Mr. WINNE. Well, yes. As I mentioned a few moments ago, I will be delighted for the opportunity to tell you briefly of some of our accomplishments in the actual operations of the plant and also in construction.

We have built, among other things, two new production facilities, which I do not feel on the basis of security I can describe here, but I think your committee knows what they are.

In both of those cases the final indicated costs are below the estimates, and our time for completion is very materially less than it was felt by the people who built the initial plant that it would take us to build these facilities.

That is on the order of only 60 percent as much time as was estimated, based on the building of the original facilities. In those facilities we have made improvements in design which will lengthen their life, increase their output and save the Government a great deal of money so long as it continues to operate these plants.

Now, I will go through this rather quickly, if I may, Senator McMahon; just a few of the items in the operation.

The CHAIRMAN. Yes.

Mr. WINNE. When we took over the operation of the Hanford Works, some of these major very costly production facilities were deteriorating rather rapidly. I want to emphasize that this was not due to any fault of the organization or organizations which designed and built these plants. This deterioration resulted from a condition which could not be foreseen on the basis of information available at the time it was built, but this did occur, and, as the Commission has said sometime in one statement which I saw in the press, threatened the continued operation of that plant.

Now, by action on the part of our technical and operating staffs, we have retarded, or we hope stopped at least for a long time, this deterioration so that the life of these expensive facilities has been very greatly increased. Had we not been able to accomplish this, a good many millions of dollars in additional investment would have been required to maintain production.

We have also materially increased the average output of these production units. We have reduced very greatly the amount of raw material required.

At present rates of production we estimate that this will amount to an annual saving on the order of \$20,000,000.

We have reduced by 20 percent, and expect to increase this to 50 percent, the amount of liquid waste which must be stored. That will result in a saving on the order of a million dollars a year at least.

We have reduced very materially the loss of plutonium going into these waste solutions, and, of course, plutonium is particularly valuable. As I mentioned before, in these new production facilities we have incorporated factors which, we think, will materially increase the output and lengthen their life.

Other savings resulting from changes in methods and processes and organization, et cetera, that we have put into effect during the year 1948 are estimated to amount to an annual rate of approximately \$3,900,000.

The net result of all this is that if the savings in raw materials, reduction in depreciation rate, and all other items are taken into account, and on the assumption that the plant must be continued in operation for a number of years—that is, that the equipment must be maintained and continue to produce—we feel that we can honestly and conservatively estimate that our operations of the plant have resulted in savings at an annual rate on the order of 40 or 50 million dollars.

That takes into account depreciation, which very often is not taken into account in Government accounting apparently, but you have

the depreciation, and if the equipment depreciates at a fast rate, you will have to replace it that much sooner, which means you will have to expend this money for these various expensive facilities.

In addition to that, we have maintained a very enviable safety record in the operation of this plant, and this record compares very favorably with any other industrial operation in spite of the very peculiar nature of the operations that we carry on there.

In my estimation, it is a remarkable safety record. The du Pont people, who operated the plant at first, also had a very good safety record, and we have maintained this very enviable safety record.

Mr. PRICE. Mr. Winne, you said a moment ago that you tried to put into this effort the same skill and efficiency that you would put into one of your own projects.

Now, do you carry that to the extent that you tried to place in charge of your operations there the same high-type top personnel that you would in your own operations?

Mr. WINNE. We have endeavored to do that. As I pointed out—I think it was last week—we have now in charge of our Hanford operations, the gentleman on my left, Mr. George R. Prout, vice president of the company, who was formerly—at the time he went out there—vice president and general manager of our air-conditioning department. He was selected because of his technical background and his administrative experience and his general ability as the man that we wished to operate that plant.

We have just augmented his staff by appointing as assistant general manager a very capable younger man, who has been assistant to the general manager of the apparatus department, which is the largest department in the General Electric Co.

We have put out there additional numbers of administrative people and high-grade technical people. We are honestly trying to operate that plant just as efficiently and effectively as we do our own commercial plants.

Mr. PRICE. And you feel that you are?

Mr. WINNE. I feel that we are approaching that, yes. We took over an organization which was trained under different methods of operation somewhat than we use in the General Electric Co., but I feel that now we have that organization pretty well functioning as a General Electric organization and that we have the top administrative and technical people there who are getting efficient and effective operation out of that plant.

Mr. PRICE. Those are all the questions I have.

Mr. DURHAM. Senator Hickenlooper?

Senator HICKENLOOPER. I would like to hurry on to two other items, because I do not like to delay these gentlemen from the General Electric.

I may say in passing that the operations of the technical facilities and production of materials have not been a question that I have raised.

Now, I referred yesterday to the two things I wanted to mention today in passing, or yesterday I had hoped. One was the water system and the pumping station at Hanford. The staff of the joint committee has prepared two digests: one on that question, and one on the lumber stock pile, which I said I would mention in passing.

I would like to read the digest of the waterworks construction matter compiled by the staff of the joint committee. It is as follows:

J. A. Terteling & Sons of Boise, Idaho, was the successful bidder on a contract to construct a new sanitary water system at Hanford on a bid of \$2,509,450 awarded December 31, 1947.

The work called for was a river pump station, new water lines to and including a settling basin, and water-treatment plant and other necessary connecting trunk and branch water lines. This system was to supersede to the present system of flooding an area in which wells are drilled with irrigation water from the Yakima River. Water pumped from these wells, after it filtered down into the wells, was chlorinated and distributed.

The plans for the new system were originated by G. E. detailed by Dewitt C. Griffin, architect-engineers. \$305,000 was authorized by AEC to pay G. E. and Griffin for their services on this job.

About the middle of January 1948 the AEC called in a water consultant, A. E. Gorman, who reviewed the plans and shortly issued a highly critical report: (a) a drainage ditch discharged into the Columbia River just above the proposed intake pump station; (b) a main water line crossed this same ditch and in case of a break, the sanitary water line could become contaminated; (c) the proposed filtered water reservoir was to be located adjacent to and slightly below the level of an open irrigation ditch with the resultant possibility of contamination; (d) certain elements of the design of the filtration plant were unsatisfactory because raw river water could enter the filtered water supply.

By this time, Terteling had found that it could not drive piling for the pump-house foundation as deeply as specified and as deep as test borings had indicated. With Gorman's report at hand, AEC directed, and G. E. concurred in stopping Terteling's work on March 2, 1948.

Alvord, Burdich & Howson, of Chicago, were hired as architect-engineers at \$25,000 to design a modified system to use a river pump to lift water to flood the dry-well area, instead of using irrigation ditch water. Terteling's contract was, meanwhile, terminated at a cost to the Government of \$241,331.79 minus perhaps a part of the \$27,497 home office overhead expense item being discussed. This is the cash cost to AEC and does not include \$130,764 paid Terteling in addition to the \$241,331.79 which represents the cost of special tools and equipment and a concrete-mixing plant, which could be and were used for other work at Hanford.

Meanwhile, the Columbia River pump was installed and when started up would not pump water because it was so far above the water level. Therefore, G. E. bought and installed a vacuum-primer pump at a cost of \$5,000, which is supposed to make it work.

For the design work on this water system which was abandoned and for the new sewage system, G. E. was paid \$39,200 and Dewitt C. Griffin & Associates \$193,700.

It appears that the Washington office of AEC initiated the action to stop work on the water project on January 20, 1948.

That is one item, and I would like to put out this other item in passing with reference to the Hanford lumber stock pile. I heard some time ago about the lumber stock pile, and I asked for the details, most of which I had, but I asked that the staff give the information from their standpoint and compile it for that authenticity.

In other words, the total stock pile purchased by the AEC through the Corps of Engineers under Government priority in 1947—I think you will recall lumber was quite high at that time and quite scarce—total stock pile purchased was 100,957,000 board feet at a value of roughly, as given here, of \$9,000,000.

The average price is given as \$89.631 per thousand board feet.

There has been consumed to date in 1949, 56,000,000 board feet, slightly over half of it. There has been shipped to other facilities, other AEC installations 4,000,000 board feet. There now remains on hand of this expensive lumber, purchased in 1947, 41,000,000 board feet.

The estimated future requirements at Hanford, which I take to be the total estimated future requirements at Hanford, are given here as 22,000,000 board feet, leaving a complete and total excess at the present time, including the estimated future requirements, of 19,000,000 board feet. As I said, this stock pile was procured through the Corps of Engineers under Government priority in 1947, and it is noted by the committee staff that lumber executives stated in hearings before the McCarthy Subcommittee on Housing in the winter of 1947-48 that the stock piling at Hanford tended to reduce the lumber available for housing and increase the lumber price at that time.

Now, I state this from memory, and I will have to ask Mr. Shugg at the proper time whether or not he verifies this statement: This lumber was purchased in 1947 at approximately \$2 a thousand over the Navy procurement price. That information, as I recall, according to a notation I have in my office, was the result of a telephone conversation with Mr. Shugg, and I have no documented proof of that other than that telephone conversation.

I am interested in the water-pumping station and its various ramifications, and apparently its final abandonment, and I believe G. E. might be interested in that.

I think the lumber stock pile G. E. had had nothing to do with. I do not know.

Mr. SHUGG. May I speak on that? On the water supply, the figures which you cited, as fast as I could follow them, were all right.

Senator HICKENLOOPER. There is a mimeographed copy of this prepared by the staff.

Mr. SHUGG. The only one was an insignificant point, at the end: This question of the vacuum pump; but I will come to that later.

There is no question but what we were going on a certain path there, and we changed our minds, because we thought we saw a better way.

Now, about four things happened at once to bring about that decision. There was, as you have stated, the opinion of our sanitary engineer. Some of the technical features of this plant—I heard a good deal of that argument. There were quite a few experts on the job, and we had the Washington State Department of Health people there, too. It was hard to know which expert was right.

There are almost two schools of thought in regard to water out there, whether you use ground water or whether you use a filtration plant.

On that technical feature, the hardest thing to evaluate was the sanitary engineer's findings as to the hazard if two things happened at once, if two or three accidents happened simultaneously or in a row. The normal operation of the plant was perfectly well designed, and what we had difficulty in doing was to try to evaluate the hazard as presented to us by the experts as to the chances of all these wrong things happening at once.

Now, in regard to that feature, we went at least to the best authority we could, Abel Wolman, at Johns Hopkins, and that technical argument was discussed with Dr. Wolman, who found in favor of the course that we followed.

At the same time that this technical disagreement was before us, there was this foundation trouble, which you have cited.

At the same time, the time of high water was approaching out there, and due to the fact that the town itself was doubling and did double

in population by the end of 1948, and the fact that the construction camp in North Richland added another 12,000, it meant that the total facilities we had to serve were tripled by the end of 1948, as compared to the summer of 1947. It went from 11,500 to 36,000.

Now, at the same time there was a healthy suspicion that the other way, the ground-water approach, the recharged ground-water approach, might be less expensive, and that discussion was a mutual one between the General Electric and its contractors and the Atomic Energy Commission.

When we did decide that we could do it a better way and at less expense, we did work fast. My records show the lump sum award to Terteling for \$2,500,000 was made on January 6, 1948, the actual award.

Senator HICKENLOOPER. January 6, 1948?

Mr. SHUGG. Yes, sir. I think we approved the selection of the bid on December 31, 1947. That was the figure you cited, sir. I think the formal award was on January 6, which is a week later.

These several reconsiderations, which almost came at once, resulted in a first partial hold being put on Terteling on February 10. The most uncertain thing was held as quickly as February 10.

On February 12 he was held on all but the pump house itself.

On February 20 that approach was canceled, and on February 27, in another week, we started him to work on the recharged ground-water basin approach and that is the system in use now.

So far, sir, that has not been a disappointment. The filtration plant—you build it all at once, and that was designed for 36,000,000 gallons a day, which was the estimated need of the town and the construction camp, not only for sanitary water but the thought then was to change over the irrigation system which had supplied about two-thirds of the householders.

Now, for the summer of 1948 it is shown by analysis that the direct charges on the work which Terteling did to get—not the same 36,000,000 gallons—but to get 17,000,000 gallons per day, was \$379,000 as his expense, \$379,000 as compared to the lump sum bid of \$2½ million.

I do not want to leave the impression that that \$379,000 gave the same capacity. A few more wells are in prospect now and another recharging basin, and a considered estimate has been made that the amount of work on the recharged ground-water approach, to get the same capacity, will be slightly under \$1,000,000.

So that moneywise we have not lost out. We have gained.

I would rather wait until the final capacity of the job is all done before I try to go on record as to what the exact saving is, but every analysis we have made shows that the capital cost by this new approach will be lower.

At the same time, there is an operating saving, which has been estimated as \$5,000 a month or \$60,000 a year, using this recharged ground-water system.

Mr. DURHAM. To what depth do you have to go?

Mr. SHUGG. They are not very deep, Mr. Durham. I am going to guess. I do not know, but I guess less than a hundred feet. I am told not much more than 50.

The original town had this type of water supply, but the wells were quite shallow. They were in the south central portion of the town

and the water table had been lowering alarmingly. The recharging of those original wells was done by just dumping irrigation water over the surface of the ground.

This particular expert who finally helped us find what I think has proven to be a better way was particularly familiar with that territory and was able to point to another area where very much better well results could be expected.

So that I have a collection of figures here, but I believe every single approach shows that the new system, even if we have to go the full 36,000,000 gallons per day, will not cost as much as the original  $2\frac{1}{2}$  million dollar job.

Now, of course, we would like not even to have incurred the cancellation charges of \$241,000, but the question was, when the combination of circumstances brought this up before the contractor and General Electric and ourselves, whether or not we would keep bull-headedly ahead on it or recognize the chance of something better and change fast, which is, anyway, what we did.

On the lumber, sir—

Mr. COLE. May I inquire: Is this an item that you referred to Washington to the Commission?

Mr. SHUGG. Washington almost instigated it, Mr. Cole, because of the fact that this new topnotch sanitary engineer we had come out to look this job over. I think it was his technical doubts that really proved the final straw, with these two or three other things that had happened almost simultaneously; so Washington was fully informed, sir.

Mr. COLE. I did not know whether this might have been an instance to which you referred earlier in the morning when you assumed to make the decision.

Mr. SHUGG. We just worked so fast here and had to work fast because the expense was starting to roll on the already let contract, and the contact back to Washington was done through this Washington staff man.

Senator HICKENLOOPER. But I understand that your theory on this is that this program was started out under the original proposal with the  $2\frac{1}{2}$  million dollar bid for a certain type of plant.

Mr. SHUGG. Yes, sir.

Senator HICKENLOOPER. And that you went forward with certain work and termination cost of that work to the Government was \$241,331.79, as shown here, but that in the process you feel you have now proved a better method for doing the same thing at a cheaper figure.

Mr. SHUGG. Yes, sir.

Senator HICKENLOOPER. And that while you would rather not have seen this \$241,000 loss to the Government, yet in the long run you feel that it may have been beneficial.

Mr. SHUGG. Yes, sir.

Senator HICKENLOOPER. And you still get a cheaper system.

Mr. SHUGG. Yes, sir.

Senator HICKENLOOPER. That is all on that.

Mr. SHUGG. A thing which we could not foresee, probably a last straw on this, I think, was the exceptionally high flood that we had about 4 months after we stopped this. I think we would have been

in trouble had we kept on with that pump house, as far as getting it into operation during the summer of 1948; but that has no place in our thinking.

Senator HICKENLOOPER. Do you agree that the digest, the mimeographed copy prepared by the joint committee staff, is substantially accurate on the procedures?

Mr. SHUGG. As I heard you read it; yes, sir. There is an item at the very end that is not much for me to complain about. That is the priming pump, which was only a several hundred dollar pump, I believe.

Senator HICKENLOOPER. It says \$5,000.

Mr. PROUT. The actual cost was between four and five hundred dollars. It was a small priming pump.

Senator HICKENLOOPER. Does it make the system work?

Mr. PROUT. Yes, sir. That was applied to a surplus pump that was put in to supply water from the Columbia River to a recharge basin, and the location of the pump and the piping that went into the river to draw the water out was such that the main pump was not self-priming.

Senator HICKENLOOPER. The pump cost four to five hundred dollars?

Mr. PROUT. The cost of the priming pump.

Senator HICKENLOOPER. What about the cost of the installation of the pump that went with it?

Mr. PROUT. The electrical installation and the piping, plus the cost of the pump, I do not have the accurate figure here—that may have been as much as \$5,000, although it sounds high.

Senator HICKENLOOPER. I think that is the figure the staff developed. So the statement that the priming pump cost \$5,000 may be inaccurate.

Mr. SHUGG. That is the main pump. The main pump itself is in the \$379,000, which did give us in the summer of 1948 half the capacity which the big plant would have.

The CHAIRMAN. How about the lumber?

Mr. SHUGG. On the lumber the situation is pretty short to state. In the fall of 1947 we were trying to mount this program, which as a whole looked as big as the original program when Hanford was built, and we were faced with figures from the original builders as to what the whole job required in lumber, and very strong opinion on the part of the construction people and the contractor and ourselves that lumber was in very short supply. If we were going to get men started, almost the first requirement is this kind of stock, so the contractor, the General Electric Co. representatives, and my office concurred, I concurred, in buying approximately 75 percent of the requirements out of hand, buying them as fast as we could.

As is evident now, if there are no more changes, we have overbought.

The CHAIRMAN. Suppose you had not been able to lick the deterioration proposition that Dr. Winne talked about. Would that have any effect on the then need for lumber?

Mr. SHUGG. That one item would not have, Mr. Chairman, but there were other things which developed which saved us lumber. In regard to the construction camp, we found a contractor did a marvelous moving job, moving old barracks down from Pasco Naval Station. We saved lumber there.

Then, due to the technical improvement on some of the production plants, we have been able to curtail some of the new plant facilities. That is the reason why at the present date we have that excess.

Mr. DURHAM. What is the differential on cost of lumber on the west coast as against the eastern seaboard? Quite a difference, is there not?

Mr. SHUGG. I am not sure, Mr. Durham. I have the way the Douglas fir average prices fluctuated out in Washington, and so far we have not lost out. This stock, which we have out there, which is 22 percent of what we bought, is in the first place——

Mr. DURHAM. There has always been a differential.

Senator HICKENLOOPER. This gives 41 percent of what you bought.

Mr. SHUGG. The final figure, I think, Senator, is that we are holding for known Hanford future need 18,000,000 and that leaves a present probable excess of 22,000,000 board feet; and that 22,000,000 I just took quickly as 22 percent of a 100,000,000.

Senator HICKENLOOPER. I was taking 41 million board feet now on hand there.

Mr. SHUGG. Yes, sir, I see. But 18 of that 41 is definitely reserved for future Hanford construction.

Of the 22 that is left, we expect that we may be able to use some of that to advantage to the Arco site. We probably will lose, although the price has not yet dropped from the time we bought this, it has been higher and has dropped again and is back to the level where we bought it. We will probably lose something on rehandling and re-shipping to Arco, but we gain something in that that is the most natural spot to season lumber due to the low humidity and low rainfall. This stuff is all strip-stacked, so we are not losing on the worth of the lumber.

Senator HICKENLOOPER. As I recall it, as I said a moment ago, as I recall the telephone conversation, I believe with you, there was an average of \$2 a thousand higher than Navy procurement price.

Mr. SHUGG. I have the sheet here, sir, and we have averaged \$1.80 per thousand higher, and that was due to the fact that it was then called Army-Navy Lumber Procurement Agency, and they were not able to buy as fast as our contractors and General Electric bought our early requirements.

I think it is fair to say that we paid a premium of \$1.80, as the figures now look, for the sake of getting what we needed fast and getting——

Mr. DURHAM. Same type lumber?

Mr. SHUGG. Yes, sir.

Senator HICKENLOOPER. Getting what you thought you needed at the time?

Mr. SHUGG. That is right, sir, and it is now evident, along with the changes that have happened since, that we bought more than we needed to have bought.

Mr. COLE. Have the changes which have occurred since you bought it been by way of curtailment of the construction program, or have the changes been an expansion of what you originally planned?

Mr. SHUGG. There are two changes, sir. One change was that we were able to tote in from considerable distances so many buildings for our construction camp. That was a saving, even though it left us with some lumber.

A big change was the fact that the technical improvements on a major part of that technical plant did result in a cancellation of some of the new technical plant building.

Senator HICKENLOOPER. In addition to this lumber, you bought several million board feet of other lumber, have you not, in addition to this 1947 purchase? That is for house construction, et cetera.

Mr. SHUGG. This sheet says that the special requirements, which were not in stock, purchased since the beginning of 1948 have been 1,757,000 board feet.

Senator HICKENLOOPER. Does that include house construction?

Mr. SHUGG. I do not have the list. That would include special sizes and special grades because, as I have said, this original purchase was not lifted from blueprints, but was taken from an over-all job comparison, and that left us with some special sizes and grades that we had to order specially. However, that amounts to less than 2 percent of the total stock.

Senator HICKENLOOPER. Mr. Shugg, last September I was in Hanford and flew over the area with the Hanford plane at a very low altitude in order to get as rapid a look at the general picture as possible. I asked to be flown over this lumber pile.

It is my recollection, quite distinctly, that I was told that most of the lumber which was there at Hanford was not usable on the project, that some other means of disposal would have to be found, because its dimensions were not generally—that is, in bulk—usable for the project.

I have a recollection—in fact, I made a notation of that, which is no better than my memory, I presume, but I was interested in what I considered to be a tremendous excess of lumber purchased and in view of the shortages other places in connection with the purchase program.

Now, that understanding I have may be wrong, but I do have that recollection.

Mr. SHUGG. These figures, Senator, that I have used, ending up in a \$22,000,000 present excess, were furnished by the Hanford office, and we can have those rechecked and find out if there is any change which needs to be made in his figure. That is the best we have at present, sir.

Mr. SCHLEMMER. I think it is possible to say, however, that whoever gave that information to Mr. Hickenlooper at the time informed him inaccurately for the reason that the lumber which is now available at Hanford is definitely usable for the program in contemplation.

Senator HICKENLOOPER. I was commenting on the pile and I said, "Well, are you going to be able to use this?" And I was told that whatever was usable on the project had mostly been used out of the original stock pile and that, unfortunately, this was of such dimension and type that there would be very little utility in the Hanford project for this remaining stock pile.

I asked what they were going to do with it, and they said, "Well, we hope we may be able to use it in some other projects or maybe we can move it or get something else done with it."

Mr. SCHLEMMER. Whoever gave you that information was certainly uninformed on the situation. Actually, the lumber has an enhanced value at the present time.

Mr. JACKSON. Mr. Shugg, I have a question. As I understand, this surplus of lumber is due to two situations:

No. 1, you discovered after you purchased it that there were housing facilities available at Pasco.

Mr. SHUGG. That was for the camp buildings, sir. We moved them up bodily.

Mr. JACKSON. You saved a substantial amount of lumber by reason of that transfer?

Mr. SHUGG. Yes, sir.

Mr. JACKSON. And, secondly, there was a cancellation in proposed construction plans that you had previously planned on at the time you made the lumber purchase.

Mr. SHUGG. Yes, sir.

Mr. JACKSON. Could you state for the record approximately how much in dollars was involved in the cancellation? I think it might help.

Mr. SHUGG. Yes, sir, I have in my mind, sir, that figure because the same thing came up in the budget hearings. It is difficult to state in open hearing, but it is over a hundred million dollars. I have it in detail with the structures lined up against it.

Mr. JACKSON. You bought this lumber predicated upon an assumption that you were going to engage in over a hundred million dollars of new construction; is that correct?

Mr. SHUGG. Yes, sir. We gambled ahead of time on our needs, with the best information that lumber was short and would continue short, and as a matter of fact, the price stayed up. The price rose after our purchase and stayed up above all during 1948, and it has dropped back now to the point of our purchase.

Mr. JACKSON. You canceled out more than a hundred million dollars in contracts; is that approximately the situation?

Mr. SHUGG. That is right, sir.

Mr. JACKSON. And this lumber that was purchased—

Mr. SHUGG. These were not contracts. Mr. Winne points out that I may have given the wrong impression. The \$100,000,000 represented plans—they had not reached the contract stage.

Mr. JACKSON. I appreciate that, but in your over-all projected plan you were working on at that time, you envisioned in part the expenditure of over a hundred million dollars in certain work and you bought the lumber based on that possibility and plan; is that correct?

Mr. SHUGG. Yes, sir.

Mr. JACKSON. And after you got along in connection with the construction of these other projects, you found it necessary by reason of certain technical improvements and changes—rather, that it was not necessary to spend the hundred-odd-million dollars; is that correct?

Mr. SHUGG. That is right, sir.

Mr. JACKSON. And this lumber relates to that, transfer of surplus housing facilities from the Pasco Naval Air Station.

Mr. SHUGG. Yes, sir; those are the two principal factors affecting the present surplus.

Mr. JACKSON. Was there any reason at the time you made this purchase that you should have foreseen this possible termination? Had there been any definite indication that you were not going to engage in this additional work?

Mr. SHUGG. No, sir. That was definitely not in the picture at the time we tried to cover three-quarters of our expected needs.

Mr. SCHLEMMER. Mr. Chairman, may I be permitted to make a few observations in connection with some of the expressions regarding the relationship between the AEC and the General Electric Co. insofar as Hanford is concerned and with particular respect to some of the matters which have been brought under question regarding methods, and so forth?

The CHAIRMAN. If you can do it in 2 minutes.

Mr. SCHLEMMER. It may take a few more than 2.

The CHAIRMAN. We are going to recess at 1 o'clock on the dot.

Mr. SCHLEMMER. May I do that tomorrow morning, Senator?

The CHAIRMAN. Yes; if you want to make a comment upon the testimony developed today.

Mr. SCHLEMMER. Thank you.

The CHAIRMAN. Senator Hickenlooper?

Senator HICKENLOOPER. Mr. Chairman, I had hoped to be able to get through with some of these major matters on Hanford. I do want to go into the question of policy of private enterprise at Hanford and Richland and the policies and the requirements established by the Commission there for engaging in business or the inability to engage in competitive business in these so-called open towns under Government operation.

And then I wonder whether Mr. Winne or anyone else here from General Electric, whether you have with you the letter of resignation of Dr. C. W. J. Wende, who was the Chief of the Pile Technology at Hanford.

Mr. WINNE. I do not have it with me.

Senator HICKENLOOPER. I have a copy of that letter. I hesitate to use a carbon copy of a letter without it being authenticated. I would like to have Dr. Wende's letter with his signature here.

Mr. WINNE. That is at Hanford, I presume.

Senator HICKENLOOPER. This was procured by the staff for me from the Commission. I do not know whether you would care to authenticate this copy or prefer to have the original letter. I would not ask you to authenticate a copy.

Mr. PROUT. We can authenticate the copy before tomorrow by calling out and having the original read to us.

The CHAIRMAN. We will recess until 10:30 tomorrow morning.

(Whereupon, at 1 p. m., the joint committee adjourned, to reconvene at 10:30 a. m., Wednesday, June 22, 1949.)

# INVESTIGATION INTO THE UNITED STATES ATOMIC ENERGY PROJECT

---

WEDNESDAY, JUNE 22, 1949

CONGRESS OF THE UNITED STATES,  
JOINT COMMITTEE ON ATOMIC ENERGY,  
*Washington, D. C.*

The joint committee met, pursuant to call, at 10:40 a. m., in the Caucus Room, Senate Office Building, Washington, D. C., Senator Brien McMahon (chairman) presiding.

Present: Senators McMahon (chairman), Millikin, Knowland, and Hickenlooper; Representatives Holifield, Price, Jackson, and Hinchshaw.

Also present: David E. Lilienthal, Chairman; Sumner T. Pike, Commissioner; Lewis L. Strauss, Commissioner; Gordon E. Dean, Commissioner; Henry D. Smyth, Commissioner; Carroll L. Wilson, General Manager; Carleton Shugg, Deputy General Manager; Frances Henderson, Assistant to the Chairman; Brig. Gen. James McCormack, Jr., Director, Division of Military Application; Walter J. Williams, Director, Division of Production; Joseph Volpe, Jr., General Counsel; Bennett Boskey and Everett L. Hollis, Office of the General Counsel; Fletcher Waller, Director, Division of Organization and Personnel; Morse Salisbury, Director, Charter Heslep, and Rodney L. Southwick, Division of Public and Technical Information Service; Edward Brosnan, Division of Security; Fred C. Schlemmer, Manager; Lloyd Bergeson, Assistant to Manager; and Charles Schank, Chief, Finance Division, Hanford Operations Office; Carroll T. Tyler, Manager of Operations, and John Macy, Director, Organization and Personnel, Los Alamos Operations Office; Richard W. Cook, Acting Manager; S. H. Sapirie, Chief of Engineering and Production; Fred W. Ford, Director of Community Affairs; and Gordon Molesworth, Special Assistant to the Manager, Oak Ridge Operations Office; all of the United States Atomic Energy Commission.

George R. Prout, Vice President and General Manager Nucleonics Department; H. A. Winne, Vice President in Charge of Engineering; Forrest E. Baker, Comptroller, Nucleonics Department (Hanford Works); Robert S. Neblett, Assistant General Manager, Nucleonics Department, Schenectady, N. Y.; and Robert Milton, Washington Representative, of the General Electric Co.

Clark Center, General Superintendent; William B. Humes, Superintendent, K-25; Clarence E. Larson, Superintendent, Y-12; Oral Rinehart, Controller; Fred Uffleman, Supervisor of Materials Control Department, Y-12; E. N. McKay, Superintendent of Product Processing and Product Chemical Department, Y-12; J. M. Herndon, Superintendent of Chemical Division, Y-12; and Logan Emlett, Super-

intendent, Operations Division, Oak Ridge National Laboratory, of the Carbide & Carbon Chemicals Corp. (Oak Ridge).

Clinton Hernandez, Vice President; Lyle D. Worrell, Assistant Project Manager; L. C. MacNeal, Project Manager; and St. John W. Davis, Audit and Budget Division Manager, of the Roane-Anderson Co. (Oak Ridge).

The CHAIRMAN. All right, gentlemen, please come to order.

Mr. Schlemmer, yesterday when we adjourned I promised you a chance to make a comment which you said would take you just a few minutes.

Mr. SCHLEMMER. Yes, Mr. Chairman.

The CHAIRMAN. Would you give it to us, please?

**STATEMENT OF FRED C. SCHLEMMER, MANAGER, HANFORD OPERATIONS OFFICE, UNITED STATES ATOMIC ENERGY COMMISSION**

Mr. SCHLEMMER. Mr. Chairman and members of the joint committee, since its inception the Hanford program has been and now is one of the largest peacetime construction programs ever undertaken. The continuing productivity of the plants was doubtful at the time of the inception of this program, due to the physical conditions which had developed in the earlier operation.

There appeared to be an urgent need for replacement of certain existing plants and for the construction of added facilities.

The international situation was acute, the importance of the Hanford project to the national security was, and in fact, as you well know, still is very great.

These facts and others produced a need for the greatest of urgency. A big, total job was needed to be done. This urgency still exists, and the job is still big.

The Commission continued the use of the General Electric Co. as the prime contractor in three major types of activity. One was the operation of the plants originally built and those to be added, the management of the community, and the construction of the added facilities.

At Hanford the Commission maintains a staff of approximately 340 people. This staff generally directs and supervises this total program.

The Commission staff acts under policies and programs developed by the Commission and the headquarters program directors and is responsible for carrying this program and these policies out.

The General Electric Co. Nucleonics Department, under its General Manager, is responsible for the design and construction of all facilities, subject to the approval of the Hanford operations office. This is a part of its total responsibility and, of course, during the program of expansion is, consequently, a very important one.

It should be recognized that the relationship between the Atomic Energy Commission and the General Electric Co. requires a high degree of teamwork. This, however, does not mean that strong differences of opinion do not or have not developed. They have and they will continue to in a program so large, so intricate, and so diversified.

The important objective, however, of this total program is to resolve all matters into what capable men consider to be the best total answer,

recognizing the need for reasonably economically, and rapidly consummating the program.

To this end, since the very inception of the program, the AEC at Washington and at Hanford has been conscious of the requirement for continuing improvement in methods, controls, and the like. The General Electric Co. has also recognized the propriety of this.

A partial history of the effort toward the improvement in the exercising of controls is disclosed in the following observations.

The necessity during the summer and the fall of 1947 for a highly expedited program of construction of the various facilities at Hanford resulted in a large and rapid expansion of the General Electric Co. organization at the site in order to handle the planning, design, procurement, securing construction contractors to perform the work, and the like. A new division was added to its existing industrial organization for this purpose.

Construction contractors capable of building the required large-scale facilities were acquired. Large numbers of construction workers, engineers, designers, and so forth, were recruited. Living facilities for these were provided.

On construction accounting in general the General Electric Co. initially followed the practices employed during the construction of the original facilities during the war. As the program progressed, and early in 1948 it became evident to the AEC that the methods used during the original program did not provide a fully adequate means of control.

Activity was instituted at that early date to effect improved controls, and vigorous efforts were made, for instance, to secure more accurate and more realistic estimates of cost, to make allocation of indirect costs to projects, to secure unit cost control, to establish construction equipment use rates.

In the fall of 1948 additional stress was placed upon the early consummation of the various improved controls. These began to bear results, which made it possible to determine cost information more accurately. It was, in fact, through the medium of these improved controls that the information on the projects now under discussion became fully apparent.

During the current year the controls over the construction program have been strengthened in various ways. Specifically, the project proposal and directive system of work authorizations has been made more explicit. The funds authorized in directives represent the total amounts which may be expended by the contractor on a given project, provided the authorized scope is not altered.

Project proposals are undergoing more extensive and more systematic review in relation to scope, over-all specifications, and design criteria.

Estimates of cost are required to be firm and conclusive before acceptance. Authorization to do work is now being given on a phase basis—that is, for development and preliminary design, for detailed design, for procurement and construction, with a cost limitation applied to each phase.

Explicit specifications and criteria, including specific cost limitations for studies and scope of design projects are in effect. More extensive review of design projects is being made during the design development.

Employment levels have been closely scrutinized and substantial force reductions have been effected—for instance, between July 1948, at which time 27,000 were employed, and May 1949, at which time 16,000 are employed. Schedules of completion are required to be firm. Stoppages of charges are invoked promptly as projects are completed. Continuing audits of the construction accounts are being made. Cost reports for individual projects, which include all elements of cost, are submitted monthly and are closely reviewed.

Special cost analyses are made as circumstances indicate these to be required. Improved inventory controls of all construction materials, supplies, and equipment have been established.

Insistence has been placed upon careful screening of all purchase requisitions against inventory. Close review of purchase requisitions is made. Continuing effort to reduce indirect expense on all projects is being exerted. Standard equipment usage rates have been established and are in effect. These are designed to absorb depreciation and maintenance costs. This applies to Government-owned equipment being used by the prime contractor in operations and by CPFF contractors or subcontractors on construction.

Construction contractor fees are established on the basis of a fee manual developed for all AEC work.

Use of lump-sum contractors is being extended to the greatest possible degree. Forms of contracts have been improved and clarified. More prompt compliance is being obtained in the matter of reducing contracts and change orders to writing.

A program of formalizing in contracts is now in effect wherever practical.

Other controls have also been instituted or are being currently developed to insure the most practical end result. In this effort the AEC and the General Electric Co. are cooperating fully.

That, Mr. Chairman, completes the statement I intended to make yesterday.

Senator HICKENLOOPER. Mr. Schlemmer, is Frank Creedon still working at Hanford?

Mr. SCHLEMMER. Yes, sir; he is.

Senator HICKENLOOPER. What is his job?

Mr. SCHLEMMER. He is the manager of the General Electric's design and construction department.

Senator HICKENLOOPER. What is his total gross pay per year?

Mr. SCHLEMMER. Do you wish me to answer that, or do you wish the General Electric Co. to answer that, Senator?

The CHAIRMAN. Do you know?

Senator HICKENLOOPER. Do you know? Are you not the general manager out there?

The CHAIRMAN. If you know, you can tell.

Mr. SCHLEMMER. His total gross salary is \$36,000 a year.

Senator HICKENLOOPER. \$36,000 a year?

Mr. SCHLEMMER. That is correct.

Senator HICKENLOOPER. He came from a Government job, did he not?

Mr. SCHLEMMER. I do not know the exact circumstances of his employment. That happened prior to my—

Senator HICKENLOOPER. Does he get any extra on top of that \$36,000 a year?

Mr. SCHLEMMER. I believe that constitutes his total compensation. Senator HICKENLOOPER. Does he get his living quarters in addition to that?

Mr. SCHLEMMER. I believe that is included within that amount, Senator. I am not quite positive on that, but I think that is the case.

Senator HICKENLOOPER. That is, of course, a reimbursable item by the Government.

Mr. SCHLEMMER. That is correct.

Senator HICKENLOOPER. Mr. Creedon was in the office of the Housing Expediter at one time here in Washington; was he not?

Mr. SCHLEMMER. I believe so.

Senator HICKENLOOPER. I think that is all I have to ask Mr. Schlemmer.

Senator MILLIKIN. Mr. Chairman.

The CHAIRMAN. Senator Millikin.

Senator MILLIKIN. I had to be absent for periods of several of these sessions, and if I am covering something that has been covered before, I would like to be alerted so that I can stop my own question.

I am not as much interested, Mr. Witness, in what General Electric is doing as I am in the measure of control between the Commission and General Electric. What has the Commission furnished General Electric as to the standards and criteria which shall govern the work of General Electric?

Mr. SCHLEMMER. The Commission has established the basic policies which control all of the activities at Hanford on which the General Electric Co. is the prime contractor.

It has established rules and regulations with respect to the accounting procedures, procurement procedures, general personnel policies, and all of the normal procedures which a client usually requires of its contractor.

Senator MILLIKIN. Now, the techniques that you described this morning—have they been prescribed by the Commission?

Mr. SCHLEMMER. They have, yes.

Senator MILLIKIN. What sort of a staff, if you know, has the Commission to do that kind of work?

Mr. SCHLEMMER. The Commission at Hanford, Senator Millikin, has a total staff of approximately 340 people. That staff, of course, is supplemented by headquarters staff in the Washington office, which outlines basic policies for use on all Commission projects, and one is at Hanford.

Senator MILLIKIN. May I ask Senator Hickenlooper whether the rules, the regulations, the contract forms, and other measures of control of the Commission have been examined?

Senator HICKENLOOPER. Not in this hearing, no.

Senator MILLIKIN. You say there are over 300 employees of the Commission at Hanford?

Mr. SCHLEMMER. That is correct.

Senator MILLIKIN. Who have to do with these control matters?

Mr. SCHLEMMER. That have to do with the total organization of directing and supervising the total Hanford project.

Senator MILLIKIN. But how many have to do with this contract business?

Mr. SCHLEMMER. I should say that approximately 50 people are directly associated with accounting in all of its various forms in the analyzation of the contract documents, in the review of all contracts made, and all of the other associated activities incident to contractual matters.

Senator MILLIKIN. Would you say they have been thoroughly and currently advised of everything that has been going on in the construction line?

Mr. SCHLEMMER. Well, in as far as contracts are concerned that is correct. In as far as work in progress is concerned, it is also correct.

However, the total staff available in the Commission's employ to handle all of the various matters related to construction is, as Mr. Shugg indicated yesterday, less than approximately 50 men. The prime responsibility for the construction activity, as is also true of the operations and the management of the community, lies with the General Electric Co. under the contract which the Commission has with it.

It is discharging that responsibility with capable personnel.

Senator MILLIKIN. What are the qualifications of the representatives of the Commission who supervise the construction activity?

Mr. SCHLEMMER. Well, the Manager of the Hanford Operation happens to be an individual who has had 30 or more years' experience on major construction activities of industrial and other types.

Subordinate to him is an organization in the Commission's Construction and Maintenance Department at Hanford, under the supervision of a person who has had extensive experience in the construction of the original facilities, principally at Oak Ridge, during the tenure of the Manhattan Engineering District.

In addition to that, the employees under his supervision are generally experienced, competent, and qualified engineers and construction men.

Senator MILLIKIN. Then I will ask you again with specific reference to the high-school business: In your opinion, was the Commission thoroughly and currently advised as to what was going on, so far as that project was concerned?

Mr. SCHLEMMER. Well, I cannot say, Senator, that it was thoroughly advised. I can say that it was reasonably currently advised. This happened to be a project which was constructed, as Mr. Shugg and Mr. Prout and Mr. Winne indicated yesterday, during a period when these various controls which were instituted early in the program were in a state of transition, and all of the facts were not immediately available.

Senator MILLIKIN. They had the basic contracts available; they had blueprints, specifications; they had visual observation of what was going on, and I assume they were currently inspecting what was going on; is that correct?

Mr. SCHLEMMER. That is substantially correct; yes, sir.

Senator MILLIKIN. Your words "reasonably currently informed"—you could drive a hay rack through that.

Mr. SCHLEMMER. I grant that.

Senator MILLIKIN. Can you tighten that up?

Mr. SCHLEMMER. I would like to be specific.

Senator MILLIKIN. I know you do not have a black-and-white answer. What I am trying to determine is, as is apparent from my ques-

tions: first, whether the Commission took reasonable steps to keep itself advised; second, whether the regional representatives were keeping themselves advised; third, whether they were transmitting their information back to the Commission so that they knew or had the opportunity to know what was going on.

Mr. SCHLEMMER. There is an area of complete responsibility on the part of the Manager of the Hanford project in connection with the consummation of the policies and the practices established by the Commission, which in my judgment is a practical and a reasonable and a proper procedure.

Senator MILLIKIN. I listened to your itemization of the various control measures that you follow there now. I did not hear any that are not normal practice in a carefully controlled operation. Why were they not put into effect earlier?

Mr. SCHLEMMER. They were instituted——

Senator MILLIKIN. There is nothing new or novel about them. They are all routine procedures if you are doing a careful job.

Mr. SCHLEMMER. Yes, sir; that is correct. These procedures or efforts to invoke the full effectiveness of these procedures were instituted both by the Commission and by the General Electric Co. very early in the program.

Senator MILLIKIN. Did the Commission give you written instructions in respect to the matters to which you have testified this morning?

Mr. SCHLEMMER. Not with respect to those individual, specific matters, but there are general principles which the Commission has established in relation to the direction and supervision of this work.

Senator MILLIKIN. May I ask someone on the Commission whether these are bulky or whether they lend themselves readily to insertion in the record? Who knows about that?

Mr. Wilson, what do you know about it?

Mr. WILSON. I am sure there is a body of regulations, instructions, and policy procedures, and other matters dealing with the conduct of this project by the General Electric Co. which have been issued to them by the AEC at Hanford.

Most of these have been worked out in cooperation with the General Electric Co., but Mr. Schlemmer can say in more detail how bulky this would be if you are inquiring as to its insertion in the record.

Senator MILLIKIN. I am speaking of what went from Washington to the Commission's representatives at Hanford.

Mr. WILSON. Mr. Schlemmer and before him Mr. Shugg were the Commission's representatives at Hanford.

Senator MILLIKIN. Then, can you tell us what you received from Washington?

Mr. SCHLEMMER. I should say, Senator, that we have received from Washington all of the instructions which reasonably capable administrators would be able to use effectively.

One point which I think is worthy——

Senator MILLIKIN. I do not want to get off of the evidence in writing of that. How did that come to you in writing? Whom did it come from?

Mr. SCHLEMMER. An example of that might be this, Senator Millikin. The preparation of the contract document and the contract fee manual, which is the product of the headquarters staff in Washington, which I believe the joint committee doubtless has in its records—that

is a document which required much thought and experience in order to apply standard engineering and construction practices to the particular work of the Commission.

Now, I think it must be necessary to understand, Senator Millikin, that at the time the Commission took over at Hanford, very few of these controls were in effect. In the initial program, which was very well done—and the organization having done it made a profound contribution to the best national interest—but it was done under war-time conditions, the proper necessity for early completion justified the elimination of many normal practices.

Consequently, controls had to be instituted and in starting a construction program of this magnitude, the urgent thing was to get the work going, to bring the people in there, to get the contractors and to get the work started. The use of close, detailed controls beyond a point of reasonableness at that time would have been a mistake, but the development of controls after the institution of the program is a proper procedure, and that has been done, and more controls will be exerted as time goes on.

Senator MILLIKIN. Has that been an evolutionary matter or did the Commission send you a rather well-rounded group of instructions on how to do these things?

Mr. SCHLEMMER. Well, it might be desirable, Senator Millikin, to submit for the record just one document known as Bulletin From the General Manager No. 128, which is by way of indicating the number of those, and there is a substantial number of them. They fill books which are very thick.

Senator MILLIKIN. What is the date?

Mr. SCHLEMMER. The subject of this—this is an amendment to previous instructions on this same subject: Supervision of construction and related activities for division headquarters office and managers of operations.

Senator MILLIKIN. What was the date of that?

Mr. SCHLEMMER. The issuance date of this is March 15, 1949. These have been forthcoming on a multiplicity of subjects ever since the institution of the Commission's activity.

Senator MILLIKIN. Mr. Chairman, I think this could be prolonged indefinitely. I wonder if we could get someone from the staff to take a look at the bulletins or instructions or whatever they may be called which have issued from the Commission to the people at Hanford as to how they should conduct their business there in relation to construction activity.

May we have somebody take a look at it? Then we can determine whether it is practical to put it in the record or whether perhaps a synopsis would serve as well.

So far as I am concerned, I am not primarily interested in what General Electric has done. I am primarily interested in what steps the Commission has taken to see that the work locally has been done well.

The CHAIRMAN. I think that is a fair request, and it should be complied with, and I will ask Mr. Borden.

(Extracts from the AEC General Manager's Bulletins are marked "Exhibit 17," and will be found in the appendix.)

Mr. VOLPE. I might say, Mr. Chairman, the information Senator Millikin requested can be furnished very readily. It is in the form

of bulletins and memoranda to the field. We have books of them, and we can provide those in no time at all.

Senator MILLIKIN. I think, at least from my viewpoint, that is a pertinent inquiry, to see what the Commission has been doing, not only in the way of regulation, but in the way of follow-up, to see that efficient practices are followed in these construction matters.

Senator HICKENLOOPER. Mr. Schlemmer, as General Manager for the Atomic Energy Commission at Hanford, what is the total contract amount that you can authorize without referral to Washington?

Mr. SCHLEMMER. The authority of the manager extends to the administration of contracts having a value of \$5,000,000.

Senator HICKENLOOPER. Can you authorize G. E. to proceed with a contract up to \$5,000,000 without referral to Washington, technically, I mean, under the authority given you?

Mr. SCHLEMMER. That is not exactly the case. There is a delegation of authority from the general manager at Washington to the manager of the Hanford project, which specifically states what the manager's authority is with respect to the administration of contracts.

Senator HICKENLOOPER. Just tell me in a few words what that is.

Mr. SCHLEMMER. Well, it is rather lengthy and covers various types of activity dealing with various subjects such as appointments and other matters of that kind.

Senator HICKENLOOPER. Could you authorize the building of \$5,000,000 worth of houses without referring that to the general manager, technically, I mean?

Mr. SCHLEMMER. No, sir; and if such authority was vested in this manager of operations, he would not do so.

Senator HICKENLOOPER. I am not asking what your practice might be. I am asking what the authority is.

Mr. SCHLEMMER. I should like to—

Senator HICKENLOOPER. What can you authorize without referral to Washington if you want to exercise your full authority?

Mr. SCHLEMMER. Specifically, Senator, the manager can authorize up to \$5,000,000.

Senator HICKENLOOPER. Yes. I understand that you say so far as your practice is concerned, you feel it is good practice to refer larger matters to Washington, but that you specifically can authorize up to \$5,000,000 without referral to Washington.

Now, may I ask you another question?

The CHAIRMAN. Pardon me, Senator. You so testified at a hearing we had in February, did you not?

Mr. SCHLEMMER. I did, sir; yes, sir.

Senator HICKENLOOPER. Let's get back to this man, Frank Creedon. What is his job at Hanford?

Mr. SCHLEMMER. He is the manager of the design and construction department of the General Electric Co.

Senator HICKENLOOPER. Does he have to do with the design and construction of piles and pile buildings or is he operating in the field of general building construction out there?

Mr. SCHLEMMER. He has to do with all construction of whatever type, except that incident to maintenance and operations. In other words, he handles all the design and construction of all new facilities of any type.

Senator HICKENLOOPER. Including facilities in the restricted area?  
Mr. SCHLEMMER. That is correct.

Senator HICKENLOOPER. Does he have any technical background in physics? That is, as a technical man, so that he is familiar with the design of atomic equipment?

Mr. SCHLEMMER. I think that he is, Senator Hickenlooper. He was, as you may know, at the Oak Ridge project during the war in a position of executive responsibility, in which capacity he had jurisdiction and responsibility for the construction of certain highly technical facilities, dealing with that plant.

Senator HICKENLOOPER. Is he an engineer by training?

Mr. SCHLEMMER. He is; yes, sir.

Senator HICKENLOOPER. Does he have with him in his department a man by the name of O'Brien?

Mr. SCHLEMMER. I do not know.

Senator HICKENLOOPER. Or Maher?

Mr. SCHLEMMER. I do not think so.

Senator HICKENLOOPER. Or Alger?

Mr. SCHLEMMER. No, sir. Those are members of the Commission.  
Senator HICKENLOOPER. And Chellman and Widmyer? They are members of the Commission staff?

Mr. SCHLEMMER. I do not know about the latter two, but there is a Mr. Maher and Mr. Alger on the Commission staff in Washington.

Senator HICKENLOOPER. Let me ask you one other question. I will preface this by saying that du Pont was originally in charge of the operations at Hanford, as you are informed, was it not?

Mr. SCHLEMMER. That is correct; yes, sir.

Senator HICKENLOOPER. Some time ago a corps of du Pont technicians were brought into Hanford, were they not?

Mr. SCHLEMMER. That is correct.

Senator HICKENLOOPER. Do you know what the total cost per year—that is, what the rate per year for that du Pont contractor operation was?

Mr. SCHLEMMER. I cannot say that I can state that figure accurately, Senator Hickenlooper.

Senator HICKENLOOPER. Was it roughly \$800,000 a year?

Mr. SCHLEMMER. I should say that is approximately correct; yes, sir.

Senator HICKENLOOPER. I feel that is all, Mr. Chairman.

The CHAIRMAN. Are there any other questions?

Mr. JACKSON. Mr. Chairman?

The CHAIRMAN. Mr. Jackson?

Mr. JACKSON. Mr. Schlemmer, I wonder if you or someone could give for the record a statement as to Mr. Creedon's background. It is my understanding that he built some large facilities for du Pont during World War I, or shortly thereafter, and also in World War II built the Kankakee ordnance plant and also supervised construction of large facilities at Oak Ridge; is that right?

Mr. SCHLEMMER. I believe that is correct, Congressman Jackson. This may be of interest to Mr. Jackson and to the balance of the committee. In connection with Mr. Creedon's work on the Manhattan Engineering District program, Mr. Walter Williams, the Director of Production of the Commission, is well informed with respect to Mr. Creedon's experience and his responsibility on that program.

Mr. JACKSON. I think the committee should know his general background. I believe the inference might remain in the committee that he is someone who had been working for the Government and then suddenly took over this job for General Electric; and I am trying to clarify the record.

Mr. SCHLEMMER. Mr. Chairman, may I suggest the possible desirability of addressing a question concerning Mr. Creedon's experience to Mr. Walter Williams of the Commission.

**STATEMENT OF WALTER J. WILLIAMS, DIRECTOR, DIVISION OF PRODUCTION, UNITED STATES ATOMIC ENERGY COMMISSION**

Mr. JACKSON. Mr. Williams, could you give the committee a general statement as to Mr. Creedon's experience, background, and qualifications?

Mr. WILLIAMS. I can give some information. I do not purport to know all about his background, but I can furnish information about the work with which I am familiar.

During the last war, I was an officer in the Army and was assigned to construction of munitions plants, under the construction quartermaster originally, and when the Corps of Engineers took over the work, I was transferred, as many other officers were, to the Corps of Engineers.

At that time Mr. Creedon was then in the Office of the Chief of Engineers, I believe he was under General Groves, and was in charge of checking, expediting, and seeing that those plants were built. I do not know how many he had, but I do know that I came in contact with him on several of those jobs. I think that a review of the records during those years will show that the plants were built in a hurry, that materials came to the jobs on time, and that they were put in place and that the construction was accomplished in very short order.

I know that Mr. Creedon had something to do with that. I was at that time in the field. I was originally known as a construction officer or a construction quartermaster, and then after that an area engineer. An area engineer with the corps was the Corps of Engineers' representative who had complete charge of the job at the site.

It was in that capacity that I first came in contact with Mr. Creedon. During those years I had every indication that he was doing a very efficient job, because our materials came in on time, we had occasional inspections on the job to see what we needed, how we were getting along, and so on.

In 1944—in fact, I think it was January 18, 1944, I was transferred to Oak Ridge and was given responsibility as construction officer for the Y-12 electromagnetic plant. At that time there was a number of difficulties in getting the job done. It was a good organization on the job, but for some reason it just was not clicking the way it should.

At that time I believe General Groves had considerable to do with it. Mr. Creedon was assigned by Stone & Webster as the project manager of the Y-12 plant. I worked very closely with Mr. Creedon in those years, because he took instructions from me as the construction officer on many occasions.

In fact, I was in charge of the job.

Mr. JACKSON. Mr. Williams, what was the cost of constructing Y-12, approximately?

Mr. WILLIAMS. As I recall, it was in the neighborhood of \$400,000,-000. That is a good figure. It might vary a little one way or the other.

Mr. JACKSON. Mr. Creedon was in charge of that project?

Mr. WILLIAMS. He was in charge of that project for the Stone & Webster Corp.

The CHAIRMAN. Do you know what his salary was then?

Mr. WILLIAMS. I do not know. I do not know what his salary was then. I understand his salary may have been \$12,000 or something, but he also had some arrangement whereby, I think, he received additional money, and I am not familiar with that. That was a matter with the Stone & Webster Corp. and the Government did not pay his full salary, as I recall it.

I think he had some contribution from Stone & Webster when the job was done. This I am not sure of. I just have heard that this was true. It was none of my affair.

During this period I can say that from January 1944, this Y-12 electromagnetic plant was not progressing the way it should. In November 1944, there had been a complete addition to the plant, which is now known as the Y-12 extension, which I am sure the committee staff is familiar with. That was started about the time that Mr. Creedon and I came on this job, and this whole job was in operation in 1944 in November.

It was, in my opinion, a very masterful job of expediting and organizing to get materials and to get a job done.

I must say, without any reflection on the Stone & Webster Corp., that they had on this job a well-knit, well-organized, experienced team, and it was a matter of expediting, directing, and some additional organization and coordination of the contractors to get the job done; and in my opinion Mr. Creedon did an outstanding job.

Mr. JACKSON. He was in charge of that particular program?

Mr. WILLIAMS. He was in charge of the entire Y-12 operation. He had a great deal of help in foremen, superintendents, and so on, that were placed there by the Stone & Webster organization, and they are due a great deal of credit for getting this job organized, but it was only after Mr. Creedon came that the job really began to get finished.

I say that. I think I was familiar indirectly, without having any direct information, I was familiar with the fact that Mr. Creedon was handling the rubber program. I believe he worked under Mr. Jeffers at that time. I am not just familiar with what he did, but I am familiar with the results and that the program was completed in good order.

During this period it was a matter of getting a job done and getting it done in a hurry, and it was done very well.

Mr. JACKSON. Mr. Williams, from your knowledge of his work at Oak Ridge, what you know about his work generally, would you say that he is a man well qualified to do the job that he is doing now at Hanford?

Mr. WILLIAMS. Judging by my experience with Mr. Creedon and his experience, I would say that he could do the job.

The CHAIRMAN. Are you through, Mr. Jackson?

Mr. JACKSON. I have a couple of questions of Mr. Schlemmer. That is all of Mr. Williams.

Mr. PRICE. Mr. Williams, you have had quite a bit of background yourself in construction work, have you not?

Mr. WILLIAMS. I might review it. I went in the Army in 1933. I went on active duty in 1933 with the Army, and was in charge of constructing CCC camps, which the Army took over sometime early, I believe, in 1933, constructing and managing CCC camps.

In 1935, I believe, the total construction for which I was directly responsible was seven or eight hundred thousand dollars. That was construction that had to be handled directly. You did not hire a contractor to do all your work for you. You had to go out and organize the construction crews, lay out the buildings, the camps, and actually pay the people, and so on.

In 1940 I was on the Panama Canal in charge of town construction for a short period, I believe 4 months.

In November I was ordered back to the States and transferred, without my consent, I may say, to the constructing quartermaster. The first job which I was in charge of was the Hoosier Ordnance Works. That was a bag-loading plant. It was started, I believe, along about April 1940. On December 27 it was about 97 percent complete.

It was, I think, somewhere in the neighborhood of \$30,000,000. I do not have it exact. But it was complete and in operation; that is, 97 percent complete and in operation.

I was transferred then to the Buckeye ordnance works to organize that job and the Atmosphere Nitrogen Corp. was the prime contractor. The job was well organized, and about 12 percent complete in April, not quite, I think 10 percent, was the scope at that time.

That job was a \$63,000,000 job. At least, that was the estimate at that time. I do not have the final figures.

I was transferred then to the Longhorn ordnance works, Karnack, Tex. That was a job that had been under construction since, I believe, about December or January 1942 and was about 1 percent complete.

On November 9 the job was 99 percent complete, and I was transferred to the west coast in charge of mining operations on a special project for the Corps of Engineers.

I was given the title at that time as district engineer, and there were three districts which I was responsible for during that period:

The Gold Hill District, a special district set up for the mining of arsenic; then a couple of other districts that were set up to investigate the mining of copper, marginal grade copper.

I was on that project about 8 months, completed our studies, made recommendations, and was then transferred to the Lake Ontario ordnance works to dismantle the first TNT plant. This was one plant that had to be dismantled in order to get equipment for the RDX program.

There was nothing spectacular about this job, except that the TNT plants were somewhat contaminated with TNT, and this was the guinea pig for working out the procedures and safety measures for the dismantling of these plants, so that they could be dismantled without disaster.

That carried me up to the time I was transferred to Fort Belvoir, and I was there for about 2 weeks and was scheduled to go—it is my understanding, I do not have any proof of this, but it is my understanding that General Larkin, for whom I worked in Panama, had

asked for me overseas. I was very much interested and wanted to go overseas, but I suppose General Groves found out I was about to get away, so he ordered me to Oak Ridge.

At Oak Ridge I was construction officer directly in charge of the Y-12 electromagnetic plant. That took about a year.

I was then placed in charge of the over-all project for the K-25 gaseous diffusion plant and that project was eventually completed a year later.

At that time I was placed in charge of production and construction for the Manhattan District and later was manager of field operations for the Atomic Energy Commission, and finally Director of Production.

I graduated from Purdue University, electrical engineering, and I had approximately 3 years' work as a control engineer with the Westinghouse Electric Elevator Co. That was prior to the Army service.

Mr. PRICE. Mr. Williams, you have been with the Commission, then, and with the Manhattan District for a considerable length of time?

Mr. WILLIAMS. January 18, 1944.

Mr. PRICE. In your opinion, do you think there has been any deterioration in program or has there been any improvement in the efficiency of operations over the years?

Mr. WILLIAMS. Anything I may say will be misconstrued by some people. I would like to elaborate a little on that.

I think the Manhattan District did an outstanding job. I think it is a job that will not be surpassed very soon. It was a job that did not have all of the complications which we now have.

The main problem was to organize, get materials, and get a job done. That job, from my looking back on it, apparently was to get some atomic bombs to help end the war. That job was accomplished. The job was not set up, in my experience with it, it was not set up as a long-range job, because from the beginning it was not known which processes would prove efficient, practicable, or if any of them would definitely prove so.

So, for that reason, much of the construction, wherever it was possible in the towns, was temporary. I think it was a good policy for the Corps of Engineers to do that, because they had no indication of the success which might come. It could well have been a very great flop. That is what I am trying to say.

But it was not. Now, looking back on it, second-guessing it; we could say that quite a bit more should have been done.

Now, there was a period after the war when there was uncertainty as to the future of the project, as to who would be in charge of it, and there was a period even after January 1, 1947, when there was considerable uncertainty in the minds of the people working on the project as to who would run it, and so on, until the Commission was appointed.

During that period it was a very vital period, and the period when it took a great deal of consoling and a great deal of talking to keep an organization together. During the period from the dropping of the bombs and the end of the war to the time the Commission took over, there was some deterioration. The Manhattan District tried to make plans, they did make plans, but they could not take definitive action and aggressive action, as they had been taking in the past on these plans, and there was a considerable let-down.

When the Commission took over, it took over under a greatly changed set of circumstances. The Commission knew and members of the Commission knew that they would be operating under peacetime conditions. They had to set up programs that would extend over a long period. They had to make these plans, they had to organize a staff. Many of the positions, in fact, practically all of the key positions in the original project were held by Army officers—colonels, majors, lieutenant colonels; and there were about 253, I believe, or 250 of these positions that were held as of January 1, 1947.

These positions had to be filled with civilians, and the whole program had to be organized on a peacetime continuing basis. I think that in view of my experience with the Manhattan District and with the Commission to date, that we have nothing to be ashamed of, if you will take it in balance, we have nothing to be ashamed of. I am speaking from my experience with this project from the beginning.

I believe that if you were permitted to tell to the public what has been accomplished, that the people would feel that the project has been in good hands and that the security of the country, so far as the making of bombs is concerned, is O. K.

Mr. JACKSON. Mr. Chairman, right there I would like to make this comment: I think the committee should request the Commission to make a statement before this committee at the appropriate time regarding the status of the over-all situation when the Commission took over, together with a statement as to the progress that has been made, of course, consistent with the limitations that may apply in connection with giving out of any classified data, but I think it is very important that the people of this country be advised as to what has been accomplished or what has not been accomplished in connection with the over-all work of the Atomic Energy Commission.

The CHAIRMAN. I do not believe, Mr. Jackson, that we will have to issue any subpoena or do any drafting to get that done and, of course, it has been understood right along that as soon as Senator Hickenlooper got through, the Commission would be given an opportunity to present witnesses.

Mr. JACKSON. I just wanted to make that comment to make my position clear on it.

May I ask Mr. Schlemmer a question or two, Mr. Chairman?

#### STATEMENT OF FRED C. SCHLEMMER—Resumed

Mr. JACKSON. Mr. Schlemmer, prior to your coming with the Commission, you were in charge of a manufacturing plant in Tennessee?

Mr. SCHLEMMER. That is correct.

Mr. JACKSON. What was the name of the company?

Mr. SCHLEMMER. I was associated with the Peerless Woolen Mills of Rossville, Ga.

Mr. JACKSON. Prior to that, would you tell the committee your experience, I believe, in the construction field?

Mr. SCHLEMMER. My experience extends over a considerable period of time, originating in 1916, since which date, with the exception of

a short period in industrial management in this location at Rossville, Ga., I have been engaged in engineering and construction projects, covering various types of activity, power plants, construction of various kinds, oil refinery construction, apartment house-hospital type construction.

During the period 1933-46 I was associated with the Tennessee Valley Authority in responsible supervisory positions in the direction of various of its hydroelectric dam projects.

Mr. JACKSON. You were in charge of construction of some of the dams?

Mr. SCHLEMMER. I was in charge of the construction of Norris Dam, Chicamauga Dam, Watts Bar, Fontana Dam.

Mr. JACKSON. What was the approximate cost involved at that time in those projects?

Mr. SCHLEMMER. Well, the total volume of cost would probably approximate, I should say, four or five hundred millions of dollars.

Mr. JACKSON. You were in charge of the construction of those projects?

Mr. SCHLEMMER. That is correct.

Mr. JACKSON. And how many men did you have under your supervision and direction, all told?

Mr. SCHLEMMER. Well, the number varied, depending upon the particular period of construction. I should say that the average on a continuing basis was probably 5,000, running up, perhaps, as high as eight or nine thousand at particular times.

Mr. JACKSON. Mr. Chairman, I wonder if I might ask Mr. Winne—I do not know whether he is familiar with it—some questions with reference to Mr. Creedon, inasmuch as he is in the employ of the General Electric Co.

The CHAIRMAN. Come up, Mr. Winne, if you do not mind.

#### STATEMENT OF H. A. WINNE, VICE PRESIDENT IN CHARGE OF ENGINEERING, GENERAL ELECTRIC CO.

Mr. JACKSON. Mr. Winne, as I understand it, Mr. Creedon was employed by your company at Hanford.

Mr. WINNE. That is correct.

Mr. JACKSON. Could you state what the attitude of the company is toward Mr. Creedon, what it was at the time they employed him, what his standing is?

Mr. WINNE. His reputation was, in our belief, very good, Mr. Jackson. Otherwise, of course, we should not have employed him.

We, at that time, the time that we entered into the contract with Mr. Creedon, were under rather severe criticism by the Commission representatives at Hanford because of their belief that the construction program was not proceeding as fast as it should.

So, in reviewing the situation, we felt that we should get in there in charge of the construction project under the general manager of the whole Hanford operations a man who had a background of major construction work, who had a good reputation in it, and we felt that Mr. Creedon was such a man on the basis of what checks we could make.

We knew of his work at Oak Ridge, which was, of course, along the same general line. We knew of his engineering background. I think he is a graduate of Massachusetts Institute of Technology. He was about, as I recall it, the only man that we felt we could get at that time.

You will realize that at this time in the postwar period there was a great deal of construction work going on, all construction companies, by and large, were very busy, and capable construction people were hard to get. So we, after long consideration in which even Mr. Wilson of our company entered, because he knew Mr. Creedon—

Mr. JACKSON. Mr. Wilson is—

Mr. WINNE. Mr. Wilson is president of General Electric Co. He knew Mr. Creedon through association with him during the war, when Mr. Creedon was expediting the rubber project, and so forth.

After long and careful consideration and discussion with the Commission, we entered into this short-term contract with Mr. Creedon at the rate which Mr. Schlemmer has given, except there is one point Mr. Schlemmer overlooked, and that is, that in addition to the \$36,000 per year salary, there is a \$3,000-living-expense allowance which is also paid to Mr. Creedon.

We felt that that was a pretty high salary, but we were, shall I say, almost desperate in our effort to get a competent man for that job, and I think that Mr. Creedon, by the results which have been attained, by and large, in the construction of the major production facilities, has demonstrated that he did speed the job up greatly and that he has brought it through.

I should emphasize also that his contract is a special one on a temporary basis, terminating at the end of this year; that it embodies none of the pension privileges and that sort of thing which our regular employees have.

Mr. JACKSON. A special 2-year contract?

Mr. WINNE. A special 2-year contract—2 years and 2 months, to be exact.

Mr. JACKSON. In your experience as vice president of General Electric Co., do you feel, considering all the circumstances that you had to face at the time, that the salary is out of line for the work that he is doing and what he has accomplished or has not accomplished?

Mr. WINNE. Well, I think that the salary is, if anything, on the high side, Mr. Jackson; but he would not agree to come for any less, and we could not at that time locate another man who we felt was equally capable of carrying on the job. So, as I say, after discussion with the Commission, we agreed upon him for this salary.

The CHAIRMAN. Is that \$3,000 isolation pay?

Mr. WINNE. Essentially that, Senator.

The CHAIRMAN. Are there any other questions, Senator Hickenlooper?

Senator HICKENLOOPER. No more questions.

The CHAIRMAN. You want to get onto another matter?

Mr. SCHLEMMER. Mr. Chairman, may I slightly amend my answer to Senator Hickenlooper with respect to the amount of money paid to the du Pont Co. for the employees to whom he directed our attention?

## STATEMENT OF FRED C. SCHLEMMER—Resumed

Mr. SCHLEMMER. That amount is approximately \$400,000, Senator Hickenlooper, instead of approximately \$800,000.

May I also, in response to Senator Hickenlooper's inquiry regarding the authority of the manager in connection with contracts, state that this authority is confined to approval of those contracts, and only those contracts that further approved programs which are within established policies.

The CHAIRMAN. In other words, if there is a housing program, we will say, that runs to \$4,500,000, and that program has been approved, you have the right to select the contractor who will do the building of those houses?

Mr. SCHLEMMER. That is correct, Mr. Chairman.

The CHAIRMAN. And make the final contract with A, or B, or C, whoever the successful bidder may be?

Mr. SCHLEMMER. That is correct, Mr. Chairman.

Senator HICKENLOOPER. Mr. Chairman, I would like to get on to some other matters here, and get this cleared up.

The CHAIRMAN. Proceed, Senator.

Senator HICKENLOOPER. As I said yesterday or the day before, before some collateral matters got into this, I am interested in the policy of free-enterprise operation in the city of Richland and in that area. I would like to read, first—the matter was first brought to my attention by a newspaperman out there who has been trying, apparently unsuccessfully, for 2 years to get office space in Richland so he can do some business, and allegations are that he has been completely blocked at every turn.

In addition, I have here a copy of a resolution of the Washington Allied Daily Newspaper Association of Seattle, Wash., adopted May 13, 1949. The resolution is short, and reads as follows:

Whereas the Allied Daily Newspapers of Washington are informed that it is the purpose of the United States Atomic Energy Commission or its agent to establish or cause to be established a newspaper in Richland or to permit but one newspaper to be established there under the favor of the Commission or its agent; be it hereby

*Resolved*, That the daily newspapers of this State regard any such procedure as a violation of the first amendment to the Constitution of the United States, which guarantees a free press throughout this country, and a flagrant transgression of the whole basis of the American concept of freedom and democratic institutions; and we reaffirm our convictions that the Richland area shall be open to any loyal American to establish a newspaper there, daily, weekly, or semiweekly, or any business institution he desires.

That is also signed by the Washington Allied Daily Newspaper Association.

Then, I have a telegram received some time ago, dated February 18 last, which is as follows, and is addressed to me, Senate Office Building:

Re Atomic Energy-General Electric investigation—

I might say parenthetically that I had asked some questions about this situation previously—I will start reading it again:

Re Atomic Energy-General Electric investigation.

We also charge the Atomic Energy Commission is barring small business and free enterprise from operating in Richland. We request your immediate consideration as to whether or not this also can be investigated while Atomic

Energy officials are in Washington. The Villager operation is only a small part of the existing iron curtain. Small-business men Pasco and Kennewick, Wash. Please advise.

(Signed) James Johnston, Chairman, 417 West Clark; Vernon Beall, Vic Hughes, Cecil Anderson, A. M. Westby, Walter Benson, Earl Hoover, I. L. Hughes, Tom McIlraith, George Hayes, Gordon Rexroth, Dale Myers.

I have got a volume of correspondence with reference to the practices or to the difficulties and practical prohibitions placed about businessmen who want to set up businesses in Richland, and newspapers that want to set up offices there, or newspaper plants.

I understand that there is some complication because the Government owns the land, but I call attention to a form contract issued entitled "Bid-Commercial Facility." I call attention to the fact that currently under this bid, for a commercial facility, before a competitive business can be authorized to build a building in Richland, a long list of agreements and affirmations and listing of things of this kind have to be entered into, among others, that it requires a percentage of the gross from this business which shall be paid to the General Electric Co.; that the builder must build his own building, to which I raise no objection at the moment because it is Government land, and the land itself cannot be sold, and the Government may not want to go into the business of building and renting buildings on unused land.

The various normal lease provisions for licensing so far as the operation of legitimate business is concerned are contained, but also they are required, for instance, in paragraph 7, to state the following:

We will carry the following lines of merchandise and provide the following services [indicate specifically the items and brand names which will be carried and the services which will be provided]:

Then, this agreement also provides in section 12, paragraph 12, that the bidder—

agrees to abide by such rules and regulations as General Electric or the Commission may from time to time establish pertaining to the use of the structures, the operation of the business, or to the health, sanitation, fire protection, and safety of the residents of Richland.

Now, the provision for the health or sanitation, fire protection, and safety of the residents of Richland is the ordinary normal provision, but it seems to me in that connection that to require a competitive free enterpriser to abide by the contingent future rules and regulations in connection with the operation of the business or the use of the structure which the General Electric or the Commission may whimsically or otherwise see fit to put out is a complete and practical throttling of free enterprise and competitive activity and operates as a control over the destiny of any free enterpriser who must invest his money building a building out there in this open town—and bear in mind this is not behind the barricades—and this, of course, must also be subject to the approval of the Commission in addition to General Electric.

Now, many of the provisions in this proposal are the perfectly normal provisions for the health, safety, and for the abiding by the laws of the community. The complaints—the situation that seems to have developed and the complaints that have been generated are these: That unless one is in the favor of the Commission or in the favor of the General Electric Co. he finds it impossible even to build his own

building on Government land there and engage in competitive enterprise; that the restrictions so hedge them about, and the influences cast by the operations there on the employees and their families, practically all of whom are employees of the project, are such that it is a complete censorship in effect of the operation of free enterprise, and there is no such thing as free competitive enterprise in this open city.

Now, that is the gist of the complaints, and that is a matter that I would like to have discussed.

Mr. JACKSON. Mr. Chairman?

The CHAIRMAN. Mr. Jackson?

Mr. JACKSON. I wonder, in connection with the question, if we could go into the newspaper matters first, because that was the first question.

Senator HICKENLOOPER. I would like to have the policy discussed, if I might. They might go into individual cases or individual items later.

Mr. JACKSON. Well, the reason I made the comment is that the newspaper question was raised first, and I happened to be out at Hanford in April of this year and checked into this matter very carefully, and I believe that there is just a complete misunderstanding on that matter, because I talked with the person who made the complaint and also with the people who were involved in this, and as I recall there was complete understanding that this matter would be thrown open to all of the bidders that were interested in the proposition; and I thought the whole matter had been cleared up because I have been in touch with people who had made the complaint in the first instance.

Senator HICKENLOOPER. It had not been cleaned up as late as at least June 6, because the newspaper situation—I would just like to have the general philosophy discussed and get some idea of what the idea is and why people cannot be permitted to go in and take their own hazards on a free enterprise and a competitive venture without being restricted and controlled and regulated by the operations unit and by the Commission.

Mr. SCHLEMMER. Mr. Chairman, I am prepared to speak with respect to whichever you desire me to, either the policy or the newspaper.

The CHAIRMAN. I think it would be well—Mr. Jackson has told us about the results of his inspection into the newspaper situation. Suppose you give us the background upon which that is based.

Mr. SCHLEMMER. Well, I might say, Mr. Chairman, that the situation with respect to the newspaper is that—

Senator HICKENLOOPER. What is the general policy, Mr. Schlemmer? May we discuss that first? I would like to know what the general policy is, and if the newspaper—if that becomes an issue—how it fits into the general policy and how the small-business men, such as cleaning plants and that kind of business, fit in; but I think it would be orderly if we got a statement of policy in the operation of competitive enterprise in Richland.

Mr. SCHLEMMER. Senator Hickenlooper, I will be very happy to proceed in whatever manner the committee desires that I proceed.

The CHAIRMAN. All right. Answer Senator Hickenlooper's question.

Mr. SCHLEMMER. Yes, sir. Richland is located in Benton County in southeastern Washington, near the junction of the Columbia and

**Yakima Rivers.** This is an arid, desert area, having an annual rainfall of 6 inches, and is subject to frequent severe sandstorms.

Pasco and Kennewick, located 12 and 10 miles east of Richland, provide the nearest passenger train service and are communities which initially substantially increased in population as the result of the Hanford projects, and more recently as the result of the construction of the McNary Dam and irrigation projects in the general vicinity.

Until World War II, Richland was an incorporated farm community with an estimated population of 300. The entire town, together with several thousand acres of land lying between the Columbia and Yakima Rivers, was purchased by the United States Government in 1943.

Immediately thereafter, a construction program was begun for the erection of housing for operating personnel, for limited commercial facilities, and for the erection of the Hanford plutonium plant. The first construction program ended during the early part of 1945.

**Senator HICKENLOOPER.** Mr. Chairman, I do not like to curtail the witness' answer, but a document in the nature of a historic review of the development of Hanford, I think, may be interesting for this record and I have no objection to having it put in, but I am interested in the conditions at Hanford and Richland now, whether or not free enterprise has complete liberty to go in there and construct its own projects and get into business and go broke and make money if they want to. I want to know whether they are controlled by the General Electric Co. policies or the Atomic Energy Commission. What is the situation at Richland now? There is a village or a town of some 30,000 there, and the Government owns land. Now, we know that, but I am not concerned with respect to this question in the history of the project, although I think it might be valuable for the record.

**Mr. SCHLEMMER.** Mr. Chairman, I am sure that I accurately understand what Senator Hickenlooper desires, and I am desirous of acceding to that. I think that in so doing it is necessary to develop the program from the initiation of this project up to the conditions which exist today, and I would like to proceed in doing that.

**The CHAIRMAN.** How long is it?

**Mr. SCHLEMMER.** Well, it will take 5 minutes, I imagine.

**Mr. HOLIFIELD.** I think we can spare 5 minutes to find out whether this is a Government-owned area or not, and what the background is.

**Senator HICKENLOOPER.** Of course, we already know that; it is already conceded.

**Mr. HOLIFIELD.** The public is entitled to these facts. We know these facts; the public is entitled to them. Let us have them brought out.

**Senator HICKENLOOPER.** I only want to expedite this, Mr. Chairman, and I am willing to sit here and listen to it.

**Mr. SCHLEMMER.** Under the original program, a maximum population of 15,000 to 16,000 persons was reached during the winter months of 1946 or 1947. The present population in the permanent town of Richland is approximately 23,000 and is expected to remain at this general level.

The construction camp at North Richland, 4 miles north of Richland proper, is of a temporary nature, and the population of this camp is not included in the above figures.

During the town of Richland's original construction program, completed in 1945, a total of 3,904 family units of housing and dormitory accommodations for 312 unattached men and 668 unattached women were provided.

When new impetus was given to the atomic energy program in the fall of 1947, it became necessary to provide additional housing for operating personnel. An additional 1,867 houses and apartment units have been added.

There is presently at Richland a total of 5,770 family dwelling units and 1,225 dormitory rooms in which the employees of the Commission, General Electric, the facility operators, and, in some instances, sub-contractors are housed.

The town of Richland is operated for the Atomic Energy Commission by the General Electric Co. under its contract with the Commission. The General Electric Co. handles the selection of all commercial facility operators for the town, subject to the approval of the Commission.

During the war, commercial facilities to meet only the absolute minimum requirements of the local population were provided. All new commercial buildings in the town of Richland at that time were constructed at Government expense, and all of the original buildings which were usable were also occupied.

The Atomic Energy Commission in its determination to develop Richland along the lines of a normal American community later established a new policy regarding commercial facilities, and business firms are now constructing their own buildings in Richland on long-term ground leases. Investors are also permitted to erect single or multiple buildings for subleasing to other businessmen.

The growing town of Richland will have two sizable business districts approximately five blocks apart, along with a number of neighborhood areas. This arrangement prevents the traffic and parking problems which plague the merchants of most American cities.

The town has elbow room and is generally designed for modern living. Additional commercial enterprises are being established in order to complete this pattern.

Commercial facility operators for Richland are, as Senator Hickenlooper indicated, selected by the General Electric Co., usually through competitive bids or proposals, although negotiation may be necessary in the case of investment building.

The rental bids must be sufficient to cover the costs for electricity—other than heat—water, sewerage, such municipal expenses as police and fire protection and street maintenance, and to provide a fair return for the use of the land.

At present, electricity and water are not metered. All factors, including experience, trade connections, character and financial resources are taken into consideration in the selection of commercial facility operators.

I shall read a list later of the number of stores that are now operating in Richland, the additional ground leases awarded, and the probable number of new stores desired.

(The list referred to is as follows:)

*Existing commercial facilities and anticipated expansion*

	Present businesses in opera- tion	Leases awarded	Additional businesses currently anticipated	Anticipated total
Food group:				
Combination stores (grocery and meat) .....	5	1	3	9
Milk dealers .....	1	1	0	2
Delicatessen .....	0	1	1	2
Bakeries .....	1	1	0	2
Frozen food lockers .....	1	0	0	1
General merchandise group:				
Department store .....	1	0	1	2
Variety stores .....	1	0	2	3
Apparel group:				
Men and boys' clothing and furnishings .....	1	1	1	3
Women's ready to wear .....	2	0	1	3
Women's accessory store .....	0	1	1	2
Shoe stores (all kinds) .....	1	1	0	2
Fur shop and exclusive apparel .....	0	0	1	1
Furniture, household, radio group:				
Furniture stores .....	1	1	0	2
Floor coverings, drapery store .....	0	0	1	1
Household appliance dealer and electric shop .....	0	0	2	2
Paint store .....	0	0	1	1
Automotive group:				
Motor vehicle dealers (new) .....	2	1	2	5
Auto supply store .....	0	1	0	1
Garage .....	0	0	1	1
Gas stations .....	4	4	2	10
Lumber, building material group:				
Lumber, building material dealers .....	0	1	1	2
Heating, plumbing equipment .....	1	0	1	2
Hardware stores .....	1	0	1	2
Luggage and leather goods store .....	0	0	1	1
Drug stores .....	3	1	3	7
Eating places:				
Cafeterias .....	1	0	0	1
Restaurants .....	2	1	2	5
Restaurants (drive-in) .....	0	1	0	1
Malt shop and dairy lunch .....	0	2	2	4
Candy store .....	1	0	1	2
Other retail stores:				
Jewelry stores .....	1	1	0	2
Book and stationery store .....	0	1	1	2
Cigar store and newsstand .....	0	0	1	1
Florist .....	1	2	0	3
Nursery, greenhouse, and garden supply store .....	0	0	1	1
Music store .....	0	1	0	1
Photo supply, camera shop .....	0	0	1	1
Photo studio .....	1	0	1	2
Sporting goods stores .....	0	1	1	2
Gift shops .....	0	0	3	3
Optical shop .....	1	0	1	2
Personal services:				
Barber shops .....	2	1	3	6
Beauty shops .....	1	1	4	6
Cleaning and dyeing plant .....	1	1	1	3
Laundry .....	1	0	0	1
Funeral director .....	0	0	1	1
Sewing center .....	0	1	0	1
Custom tailoring .....	0	0	1	1
Shoe repair .....	1	0	1	2
Services allied to transportation:				
Warehouse (cold storage) .....	0	0	1	1
Warehouse (others) .....	0	0	1	1
Cabinet shop .....	0	0	1	1
Drinking places:				
Taverns .....	1	0	0	1
Liquor store .....	1	0	0	1
Beverage store .....	0	0	1	1
Entertainment:				
Theaters .....	2	1	0	3
Bowling alleys .....	1	0	1	2
Poolrooms .....	1	1	0	2

Mr. SCHLEMMER. These totals, of course, will probably change in the course of time, but at the present they appear to be the proper numbers for each type of business.

Approximately 50 businesses are now operating in Richland. All but 9 of them are houses in Government-owned buildings. Six of these buildings or these businesses, a furniture and electrical appliance store, a Studebaker dealership, a frozen-food locker plant, and a men's and boys' store, a sporting goods store, a florist, and a ready-mix concrete plant, are operating in their own modern facilities.

Additional privately owned business buildings are now under construction under long-term ground leases, and leases have been awarded to approximately 25 additional businesses which are now preparing plans for the construction of their own buildings.

Current planning contemplates the awarding of an additional number of ground leases in order to provide an adequate number of retail outlets to serve the needs of the population and to provide competition in business generally.

The problem of conversion of a community which, since its origin, has been completely Government-owned and operated, to one which it is hoped will ultimately approach normalcy, is certainly not a simple one.

Those who have not actually experienced or participated in such a transition may not be fully aware of the complications involved. Actually, there are very few, if any persons, who have directed or taken part in converting a one-industry town, in which all property is owned by the Government and all residents are employees of the Government directly or indirectly, into a community which is normal in the sense that it allows for ownership and transfer of property, freedom of selection of location of business or residence, as well as providing for taxation, financial stability, and the like.

The ultimate objective of the Commission is to approach so-called normalcy in the town of Richland as promptly as the conditions permit, and as the problems can be solved.

The Commission would prefer to entirely divorce itself from community ownership and operation if this were possible. However, its responsibility to provide for the operation of the important production facilities at Hanford will not permit so doing in the early future.

Perhaps, in not too many years, this may be worked out successfully, but until then it must assure the provision of proper living facilities for its people.

The Commission recognizes that the particular situation of location which exists at its Hanford project necessitates its being continually aware of the importance of people in the operation of its plants. These people must be adequately housed and provided with reasonable amenities, such as schools, churches, medical services, recreational and cultural facilities, and, in addition, with adequate commercial facilities such as food and merchandise stores, banks, service-type businesses, and other facilities which a city of 25,000 people would normally provide.

The Commission has already moved forward in the direction of its ultimate objective through the step from Government ownership of commercial-facility structures operated by concessionaires to privately built and operated commercial facilities on leased land.

The next step to land ownership by individuals or groups will be a large one, and can only be done on a community-wide basis covering land ownership for all purposes. Many, many problems require solv-

ing before this can be done. In developing the policy of leasing land for private construction and operation of commercial facilities, the Commission first established what appeared to be the basic requirement in types and numbers of facilities felt to be immediately essential in addition to those already in existence under the previous policy of leasing Government-owned and built structures.

In this study the Commission determined that initially approximately 100 commercial facilities of varying types would form the basic structure on which further development would be made.

I would like to later read the general types of such businesses.

In endeavoring to establish these businesses in the commercial areas of Richland, the General Electric Co. contacted all persons and companies who had at any time had indicated an interest in establishing a business in Richland.

In addition, they have contacted many hundreds of other people or companies in business in the Pacific Northwest and in adjacent regions.

It further distributed information concerning the Commission's program of commercial-facility expansion in Richland through the medium of news articles in regional papers, public addresses in the various larger communities, advertising and national publications such as the Wall Street Journal and the New York Times, and in discussions with correspondents of nationally circulated magazines who visited Richland.

In addition, staff members visited numerous cities for the purpose of discussing this expansion program with businessmen in the various fields.

Following these introductory methods, the General Electric Co. contacted many hundreds of persons or companies to ascertain their interest in bidding competitively for specific types of facilities if invitations to bid were sent to them.

Approximately 450 of these indicated interests, and invitations to bid were sent to those persons or companies. Of this number, approximately 80 bids have been received, from which 33 awards have been made.

In sending out invitations to bid, the General Electric Co., commercial facilities division, includes a bulletin describing the town of Richland, the existing commercial facilities operating in Government-owned structures, the number of facilities anticipated to be immediately required, and the number which it is ultimately hoped may become established.

In addition, the prospective bidders are supplied with a bid form which states the requirements, what is expected of the bidder, how the successful bidder will be chosen, what the method of rental will be, and other similar information designed to be helpful to the prospective bidder.

The bids are required to be submitted by a stipulated bid opening date, at which time they are opened by the General Electric Co. in the presence of a representative of the Commission.

The General Electric Co. then makes an abstract or analysis of the bids submitted and recommends the most desirable bid to the Commission for award approval. The successful bidder is normally chosen on the basis of his having bid the highest rate of rental to the Government. Consideration is given to reputation, financial stability, and similar factors.

The return to the Government is in the form of a percentage of gross income of the operator and provides for a minimum monthly rental, usually sufficient to cover the expense of services, such as electricity, water supply, trash and garbage collection, police and fire protection, and steam supply for heating purposes.

There are two principal commercial areas in the town of Richland, one being that originally developed with Government-built structures and the other a new area now under development in which facility operators build structures with their own capital.

In addition to the two principal commercial areas, there are a number of smaller neighborhood commercial areas at various locations throughout the community.

Within the area of Richland the greater portion of the land is used for dwellings, schools, hospitals, administrative offices, warehouses, storage yards, shops, and so forth.

Under the master town plan, certain locations have been selected for commercial facility use, either as merchandising units, light industrial areas, heavy industrial areas, and so forth.

By reason of the extensive use of land for residence purposes, the areas available for commercial development are somewhat limited but are still considered to be fully adequate for the ultimate needs of the community.

Certain zoning principles are applied in the master plan in order to assure against the ultimate depreciation of property values through poor or improper location of commercial facility areas. At the same time, the convenience of location of these areas is given full consideration.

Under the existing policy for the establishment of commercial facilities, the Commission feels, and definitely so, that it has taken a forward step in moving toward ultimate normalcy. As the conditions permit, still further advances are expected to be made.

I think, Mr. Chairman, that that constitutes a general statement of policy with respect to the operation of commercial facilities at Richland.

Senator HICKENLOOPER. Mr. Chairman, now that the general policy has been adopted or announced, I submit that it is completely clear that private enterprise cannot go into Richland under any circumstances without the approval and the determination of the most desirable in the view of the Commission and the General Electric Co.

I can understand, and I think it is good practice, that town zoning be adopted, and I assume that it has; I can understand that there should be a tax equivalent for services furnished; I can understand that a reasonable land grant is perfectly justifiable. I can also understand that there should be, in my opinion, a provision for amortization of the cost of the structure that a private enterpriser would put on there over the period of his lease, because it undoubtedly will revert to the Government at the end of the lease; that is, the structure that he puts on there, the real estate being owned by the Government. But I certainly cannot go along with the policy that if free enterprise is the objective—and control and dictation of the policy of businesses as long as they are legal is not the objective—why a factor cannot be developed permitting anybody—if there are 10 restaurants in the town and 5 more want to come in and venture their

own capital and they can build their own buildings and take their chance on making a living, why a factor cannot be set up there saying, "Surely, here is a zoned area; the price of the rental of this lot will be so much per year, reflecting the services to be furnished. You will be expected to put up a building in keeping with the other structures in this area, and your entire pay to the Government will be so much money for this structure. Now, make it if you can."

The CHAIRMAN. You would not let any hoodlums in it; would you, Senator?

Senator HICKENLOOPER. Well, I think the present——

The CHAIRMAN. Their idea of free enterprise might be quite detrimental.

Senator HICKENLOOPER. I am talking about free enterprise.

The CHAIRMAN. Well, hoodlums run legal enterprises sometimes.

Senator HICKENLOOPER. I do not know exactly who would be hoodlums, but if a man has the money to buy a lot or rent a lot in Washington, D. C., or Crossroads Corners, and if he has the money to start a business and establish it, I think the question of hoodlumism can come up later in the success of his enterprise. Of course, we would like to see the highest class of people get in there, but I think the average businessman who has money enough to venture into a thing like this, the chances are that probably he is a long way from hoodlumism.

The CHAIRMAN. I know, but it might be a bad place to have some questionable characters, no matter how good their business is, and how good their business ability, and how much money they have got. We have got a peculiar situation here.

I certainly would want to screen fairly carefully anybody who came in here.

Senator HICKENLOOPER. It is an open town; it is not a restricted area, and it is just a question of whether it is free enterprise or whether the operation of that man's business and everything that goes with it is subject to the control and the dictation of the Commission and the General Electric Co.

The CHAIRMAN. Just a minute, Senator. The House Members have to leave to make their roll call, and Mr. Jackson has one question he tells me he wants to ask.

Mr. JACKSON. Yes, Mr. Chairman.

Before you reply to Senator Hickenlooper's question, Mr. Schlemmer, I wonder if this question of the newspaper issue that was raised might be clarified. As I understand it, Senator Hickenlooper received a letter or a wire in June, or this month, stating that there was some question about keeping these people out who wanted to bid.

Now, is it not a fact that on May 23, 1949, invitation to bid, invitation for bids was sent out to the various bidders; is that correct?

Mr. SCHLEMMER. That is correct.

Mr. JACKSON. Dated May 23?

Mr. SCHLEMMER. I believe that is the correct date. May 23; that is correct.

Mr. JACKSON. I ask that the entire bid form be made a part of the record.

The CHAIRMAN. Yes.

(The documents referred to were marked "Exhibit 18" and will be found in the appendix.)

Mr. JACKSON. Under section 8 I would like to read into the record this particular clause:

VIII. Attention is invited to the policy and objectives of the Commission and the General Electric Co. to the effect that the purpose of competitive bids on the publication of newspapers in the town of Richland is to obtain under equitable conditions a locally produced newspaper or newspapers for the town of Richland, and to insure fairness to all interested parties in the assignment of sites for places of business. This is not an invitation to bid for the exclusive privilege of operating a newspaper in the town of Richland. Any and all bidders who meet the terms of this invitation and bid form may, if they choose, operate a newspaper in the town of Richland.

Then it goes on to mention six sites. I wanted to state, Mr. Chairman, for the record, that this matter, I thought, was settled to the satisfaction of everyone in April when I was out there.

I discussed it with the Allied Newspaper Association, and they were fully familiar with the proposal that the Commission and the General Electric Co. was going to make at that time, and a letter was sent, I believe, by Mr. Sumner T. Pike, Member of the Commission, to the Allied Newspaper Association, in the early part of this month, explaining the bid form, and apparently someone had sent a letter—or at least I received one, too—from the Allied Newspaper Association without having read the invitation to bid, but certainly there cannot be any question about the fact that under the terms of this invitation that any and all newspapers which want to come in and bid on the proposal have the right to come in. Is that correct?

Mr. SCHLEMMER. That is entirely correct.

I happen to have the copy of the communication from Commissioner Pike to the Allied Daily Newspapers, in addition to which discussions were held with the Washington State Publishers Association prior to the development of these bid invitations. The matter was discussed with the American Newspaper Publishers Association; considerable correspondence exchanged between Mr. Cranston Williams, the executive secretary of that organization, and the manager of Hanford.

The bid invitations were issued, as Congressman Jackson has stated, on May 23; the invitations went out to 23 persons or organizations who, over an extended period of time, had indicated interest in an opportunity for the establishment of a newspaper in Richland; and I simply am unable to understand how the person who advised Senator Hickenlooper on June 6 of these conditions could have done so if he was sufficiently interested to ascertain what the actual facts in the case are.

Senator MILLIKIN. Mr. Chairman, may I ask a question?

The CHAIRMAN. Senator Millikin?

Senator MILLIKIN. Why did you not let the newspapers which wanted to come in, come in, anybody who wanted to run a newspaper?

Mr. SCHLEMMER. This, Senator Millikin, actually provides for that. This is really an invitation to bid on the use of land. It is not an invitation with respect to a newspaper.

Senator MILLIKIN. Why the invitation? Why the selective process of invitation? Why did you not let anybody come in on your rental terms whatever they might be, first come, first served, to establish newspapers there?

Mr. SCHLEMMER. Well, this would seem to accomplish that very thing, Senator Millikin.

Senator MILLIKIN. Well, I suggest it does not, because you are making an invitation—you are inviting the people who should join your lodge.

Mr. SCHLEMMER. Here is the situation, Mr. Chairman, and members of the committee: The matter of land use is a very important one in Richland. It involves housing, it involves—

Senator MILLIKIN. May I interrupt you to say that that is a municipal problem common to every municipality in the United States?

Mr. SCHLEMMER. That is correct. However—

Senator MILLIKIN. Everything that you pointed out as a security problem of this town that you are talking about is peculiar to every other municipality.

Mr. SCHLEMMER. However, there is only one such town as this in the entire United States.

Senator MILLIKIN. I hope we never have more if you are running the business there on an invitational basis. What is your theory of that? What gives you this God-given right to issue invitations to people who shall enjoy the benefits or the hazards of that town? What is in the back of your heads that leads you to a philosophy of that kind?

Mr. SCHLEMMER. There are certain responsibilities, Senator, in connection with the operation—

Senator MILLIKIN. What is your responsibility except to run a decent town there?

Mr. SCHLEMMER. The first responsibility is to protect the national security involved and surrounding the plutonium plants there.

Senator MILLIKIN. Does anyone have access to that town?

Mr. SCHLEMMER. Everybody has access.

Senator MILLIKIN. Everybody has access to it. So what is left to that point?

Mr. SCHLEMMER. The town is provided for the housing of the operating employees of the plants.

Senator MILLIKIN. Can anyone come in and take lodging with any of the people who live in those houses?

Mr. SCHLEMMER. The accommodations do not permit that, but it could be done.

Senator MILLIKIN. John Doakes can invite Richard Oakes to come in and visit with him in his house?

Mr. SCHLEMMER. Yes, indeed.

Senator MILLIKIN. You exercise supervision over that?

Mr. SCHLEMMER. Indeed not.

Senator MILLIKIN. Why over the merchants?

Mr. SCHLEMMER. We actually exercise no supervision over the merchants.

Senator MILLIKIN. Senator Hickenlooper read a paragraph there where they have got to run their business under your control.

Mr. SCHLEMMER. Some of the implications of Senator Hickenlooper's remarks—

Senator MILLIKIN. I am not speaking of his remarks; I am speaking of what he read from the contract. Would you mind reading that again, Senator Hickenlooper?

Senator HICKENLOOPER. Senator, the contract provides that the lessee agrees to—

abide by such rules and regulations as General Electric or the Commission may from time to time establish pertaining to the use of the structures, the operation of the business—

Senator MILLIKIN. Get the word "operation" of the business, please.  
Senator HICKENLOOPER (reading):

or to the health, sanitation, fire protection, and safety of the residents of Richland.

Senator MILLIKIN. What is your explanation for that? The security suggestion, I respectfully say, is sheer bunk, because the town is open to anyone who wants to go through it; people are at liberty to linger there if they want to. They are at liberty to visit anyone who lives in those five or six thousand houses that you mention there. Give me some more reasons for it.

Mr. SCHLEMMER. Well, the limitation on the use of land is a very important one, Senator. The availability of land is extremely limited and, therefore, it must be a major factor in the establishment of commercial facilities in Richland.

Senator MILLIKIN. You mean that you do not have enough, you have not set aside enough commercial area to take care of commerce on a free enterprise basis in laying out that city?

Mr. SCHLEMMER. We consider that we have set aside a fully adequate area; yes, sir.

Senator MILLIKIN. Under your control system; correct?

Mr. SCHLEMMER. I am sorry, Senator, but I cannot see the point of the control which you indicate.

Senator MILLIKIN. The point is in your contract, sir. The point is in your contract, and the point is in your selective invitations to people to come and do business there. Are not those two points evident to you? Is that not perfectly evident to you?

Mr. SCHLEMMER. It is evident to me, of course.

Senator MILLIKIN. Does it not have any impact on your mind at all as distinguishing what you are doing there from what you customarily understand happens in a free enterprise town?

Mr. VOLPE. Senator Hickenlooper, can I answer this question?

Senator MILLIKIN. Millikin is my name. [Laughter.] I have three "i's" in my name and I am using all of them. [Laughter.]

Mr. VOLPE. Senator, in the first place, we must keep in mind here that the boundaries of this area were determined by the Manhattan District when the area was first acquired. The first requirement in the area is to provide housing, to provide schools, to provide all the necessary facilities to maintain the people who work in the plant.

Senator MILLIKIN. That is a function of any town.

Mr. VOLPE. That is right, sir.

Senator MILLIKIN. Any town.

Mr. VOLPE. Now, the difference between this town and other towns is that the Government is carrying on an operation here, a production operation which requires people.

Senator MILLIKIN. Yes.

Mr. VOLPE. We cannot—

Senator MILLIKIN. That is the function of every town.

Mr. VOLPE. Well, I respectfully—

Senator MILLIKIN. That is why you have any town; it is to take care of people who have some activity in that town.

Mr. VOLPE. Well, I respectfully—

Senator MILLIKIN. You have one employer here. In other towns you have one employer, you have a dozen, but the problem is the same.

Mr. VOLPE. Well, Senator, I would respectfully disagree that it is the same for this reason: A community may be perfectly willing to let an industrial organization try on its own to get the people who are needed in carrying on the enterprise. A municipality does not guarantee to any industrial organization that the municipality itself will provide the people who are needed to carry on a particular piece of work or to work in a particular type of industry.

Unlike the situation at Hanford, an ordinary municipality is not interested—is interested, of course—but it does not have any obligation to industry in that area to provide the people who work in that plant.

Here at Hanford and at Oak Ridge and at Los Alamos, our first responsibility is to provide the people who are used in the operation of these plants.

Senator MILLIKIN. All right. Let us assume that.

Mr. VOLPE. So that in that respect it is quite unlike other municipalities.

From the standpoint of these lease agreements, the lease arrangement here is—

Senator MILLIKIN. The problem of the employer in any other municipality is the same. He must find his people.

Mr. VOLPE. Yes.

Senator MILLIKIN. And he must get them established in the town, and some place in the town through this cumbersome operation of free enterprise, they find the food and the services and the other things they need.

Mr. VOLPE. Yes, Senator. I happen to be familiar—

Senator MILLIKIN. Let me suggest to you that there has never been a town of 20,000 people or more that was established overnight that did not almost overnight find the facilities necessary for its operation. Now, it is not orderly, there are duplications, some make money, some do not, some are not quite of the caliber that you might otherwise admit into your lodge, but those things take care of themselves.

Mr. VOLPE. Senator, if I may say so, I think that is somewhat of an oversimplification of the problem for this reason: I am sure the Senator is familiar with some of the industrial towns which exist in this country. It happens that there is one in New Jersey, or there was one in New Jersey, with which I was familiar. It was operated by John Roebling & Sons.

Senator MILLIKIN. Did you ever hear about company stores and the objection to those?

Mr. VOLPE. Yes, sir; I certainly did.

Senator MILLIKIN. Did you ever hear about the objection that is always raised when an industry attempts to choose the businesses that shall be in the town?

Mr. VOLPE. There is no question about that.

Senator MILLIKIN. We have had strikes and we have had deaths over that sort of thing.

Mr. VOLPE. Senator, there is no question about it, and I would like to emphasize here that this matter of operating—

Senator MILLIKIN. This employee that we are talking about, perhaps, desires the opportunity to shop in a disorderly way, to pay

more, perhaps, than he should pay. He also wants the opportunity to look for bargains.

Mr. VOLPE. Well, Senator, I must emphasize right here that if the Commission could have found in the past 2½ years, or could find tomorrow an easy way out of operating these towns, you can be assured they would have done so.

What I am trying to say is that it is impossible to simply open up these towns and say to people, "Do as you will."

In the first place, there is not enough land for it. On the matter of newspapers, the question there is—newspapers or any other enterprise—the question is the desirability of a location of a store. Now, how do you determine whether if there are 50 people who are interested in putting up a clothing store, you will permit Mr. X to put it up in the most desirable place, except by bid, except by competition in that way?

Senator MILLIKIN. But why did you put the provision in the contract that this business shall be subject to your control?

Mr. VOLPE. Not subject to our control.

Senator MILLIKIN. Obviously, if you have a limited amount of space you have got to have some method of determining who goes into that facility. Obviously that is so. Why the provision in the contract for controlling the business?

Mr. VOLPE. Senator Hickenlooper—

Senator MILLIKIN. You do not insult me when you call me Senator Hickenlooper. [Laughter.] I just want the thing to be kept straight. [Laughter.]

Mr. VOLPE. Senator Millikin, I might just interject here that, for example, at Oak Ridge where they have had quite a bit of experience with this, they have found from the experience that it is possible not to require some of the conditions that have been required out at Hanford. Now, one of the reasons for that is that there is considerably more land available.

Senator MILLIKIN. Let us assume that you had to have some method for putting a limited number of people into a limited space. Let us assume it. Why a provision in the contract for controlling the business?

Mr. VOLPE. Senator, when you say "controlling the business"—

Senator MILLIKIN. That is the third time I have asked you that question.

Mr. VOLPE. Yes. When you say "controlling the business" we have to define that. We have provisions in these leases that amount to a certain amount of control. That does not mean that we control the businesses. There are in this lease certain provisions which are normal between landlord and tenant.

Senator MILLIKIN. Is this provision that Senator Hickenlooper read normal?

Mr. VOLPE. Senator, it is normal, for example, for a landlord—

Senator MILLIKIN. Senator Hickenlooper, will you let me have that provision, please? Let us keep on this little point that I am talking about, about this control provision, no other point, no diversions. Just keep on that little point.

Now, do we understand each other?

Mr. VOLPE. We certainly do.

Senator MILLIKIN. Will you talk to the point? [Laughter.]

Mr. VOLPE. May I have the section, Senator?

The CHAIRMAN. You invited yourself into this. [Laughter.]

Senator MILLIKIN (reading):

Abide by such rules and such regulations as General Electric or the Commission may from time to time establish pertaining to the use of the structure—  
no limitations on that?—

the operation of the business—

no limitation on that?—

or to the health, sanitation, fire protection, and safety of the residents of Richland.

Mr. VOLPE. Well, Senator, that is not unusual for a lease arrangement between landlord and tenant.

Senator MILLIKIN. I challenge you to find a single lease in private enterprise where that is so, where there is any right to control the operation of a business.

Mr. VOLPE. The use of the property.

Senator MILLIKIN. I am talking about the operation of the business.

Mr. VOLPE. Sir, you are inserting the word "operation" for the word "use."

Senator MILLIKIN. It says "the operation of the business," that is what it says.

Mr. VOLPE. In connection with the use.

Senator MILLIKIN. Let us talk about the operation of the business; it sits there in separate context. Talk just about that now, nothing else. Find for me one lease in private enterprise where the lessor has the right to operate the business.

Mr. VOLPE. He does not operate the business, Senator, and all that means is this: That if the property is leased for one purpose, the lessee does not have a right to change to some other purpose.

Senator MILLIKIN. That is what you say it means, but the words do not say that. The words say "the operation of the business."

Mr. VOLPE. In connection with the operation of the business, if the business will have to be operated on a business like basis.

Senator MILLIKIN. Oh, well, that is just what I am talking about. Why should not a man have the privilege of operating his business on an unbusinesslike basis?

Mr. VOLPE. Because it would be detrimental to this community.

Senator MILLIKIN. Then, you do claim the right of control; you claim the right of control under your own admission to determine that the man shall operate on what you consider to be a businesslike basis, correct?

Mr. VOLPE. Senator, that is correct.

Senator MILLIKIN. Correct. That is all I want to know.

Mr. VOLPE. May I add to that?

Senator MILLIKIN. You have got a perfect pattern here for fascistic control over business under your own admission, sir.

Mr. VOLPE. Yes; I agree with that, sir.

Senator MILLIKIN. That is very interesting, and I think that is the point that Senator Hickenlooper intended to get at before I went rampaging around here. [Laughter.]

Mr. VOLPE. May I comment on that here?

Senator MILLIKIN. Yes, sure; and I will have something to say, too.

Mr. VOLPE. I am sure of that, sir. [Laughter.]

As long as the Government is responsible for this community, as I said before, they certainly would not like to be responsible for it, but as long as they are responsible for it, there is a responsibility, Senator Millikin, for assuring this community facilities, commercial facilities, which will be operated on a businesslike basis.

Now, there are many reasons for that; there are many reasons for that. In the first place—

Senator MILLIKIN. It is perfectly absurd.

Mr. VOLPE (continuing). The land is limited, and if a facility is brought into the town, that does not give the service of the community that the community needs, obviously the community will suffer and in turn the operations of the Commission will suffer.

Senator MILLIKIN. Do you not appreciate that everything that you have said is a casebook argument for controls which is the antithesis of the free-enterprise system, and I may say to you that this theory that you are moving forward, that reminds me of the last campaign, "You are moving forward in unity to some day get rid of these controls." [Laughter.]

Everyone who exercises these interim trusteeships under that sort of a political conception always says the same thing.

The CHAIRMAN. You predict disaster, I take it, Senator?

Senator MILLIKIN. You always have disaster in the end if you do not leave a little scope for individuality and individualism. I am not so sure that the Commission is able—I am not at all sure that the Commission has demonstrated that it is able in any substantial degree to manage its affairs or the citizens' affairs better than the citizens can manage them themselves. If the chairman wishes to raise that basic problem—

The CHAIRMAN. No.

Senator MILLIKIN. I am glad he does not wish to raise it.

The CHAIRMAN. No; I was just interested in the fact—

Senator MILLIKIN. I am very much interested, too. That goes to the base of what we are talking about: Is the opinion of someone who is not running the business that he can run it better than the man who is running it?

Mr. VOLPE. Senator, we do not like that, either. We do not like it at all.

Senator MILLIKIN. But you have got it.

Mr. VOLPE. As a matter of fact, we have got it worse—

Senator MILLIKIN. You got it, and you are defending it.

Mr. VOLPE. We are not defending it. What we inherited was worse than that. What we inherited was a situation where everything was owned by the Government, operated under concession, with strict controls over it, and what we are attempting to do now is move away from that.

All I am saying, Senator, is that you cannot move away from that overnight. You cannot move away from it overnight because the Government owns the houses and the Government owns all the land, and these communities are there for a single purpose.

Senator MILLIKIN. How long do you make these leases where a man builds his building?

Mr. VOLPE. They are long-term leases.

Senator MILLIKIN. Is your move away from this system going to be 20 years from now?

Mr. VOLPE. Senator, if we could convert this to a community where the citizens in the community could assume the responsibility for operating the community, we would be very happy to do so tomorrow.

Senator MILLIKIN. You are doing it 20 years, in future, and then some smart fellow will say, "Well, gee, we have still got to tell the businessman how to run his business in a businesslike way," and you will have a 20-year extension.

Mr. VOLPE. Well, Senator, actually the 20-year, long-term clause is not our wish. It is the wish of the individual who wants to put up a building. He would not want to put it up on a 1-year lease.

Senator MILLIKIN. He would be a fool to take that lease.

Mr. VOLPE. That is right.

Senator MILLIKIN. And he would be a fool to allow you under your contract to operate his business. I can understand why you have a selected list of "suckers" that you invite to come in there. [Laughter.]

Mr. VOLPE. I again say we do not operate his business.

Senator MILLIKIN. Do you have a box with a black ball in it when you are considering these people? [Laughter.]

The CHAIRMAN. What practical control do you use? What I want to know is, this clause is in the contract. Under this clause, I think I can agree with Senator Millikin as I heard it read, that if a fellow wanted to run a cut-rate sale in a clothing store he cannot do it. Now, the question arises how have you exercised that power? What kind of actual control do you exercise over the businesses there? Do you attempt to set their prices? Do you attempt to set their volume? Do you attempt to set their sales days? What is the answer to that?

Senator MILLIKIN. May I answer, Mr. Chairman? The answer will be, of course, "No." The offensive part is in the right to do it.

Thank you for allowing me to answer. [Laughter.]

The CHAIRMAN. I am interested not only in the right to do it, but I am also interested in what you have done, even though nobody else should be.

Senator MILLIKIN. Mr. Chairman, I am going over to eat a semi-free enterprise lunch now, in which the Government pays a subsidy toward a part of it. [Laughter.]

The CHAIRMAN. I think that is a very practical question, though. We might have a good deal of criticism of that clause in the lease just because it is there; but I think there would be more criticism if under that clause you attempted to operate, as Senator Millikin has indicated, fascistically.

Now, have you been doing any fascistic things out there?

Mr. VOLPE. Absolutely not.

The CHAIRMAN. What is the answer to that question?

Mr. SCHLEMMER. Indeed we are not, Mr. Chairman. May I suggest, Mr. Chairman, that the form of lease which is presently—

The CHAIRMAN. You can suggest the answer to the question; that is what I would like to have.

Mr. SCHLEMMER. The answer is "No," we do not exercise the control you spoke of.

The CHAIRMAN. When a man comes in there and operates a drug store, are there any instances, either in the case of the drug store that

you have or any of the others, where you have said, "This thing is too high," or "This thing is too low?"

Mr. SCHLEMMER. There are none of which I am aware.

The CHAIRMAN. Well, you would be aware of it?

Mr. SCHLEMMER. I would be.

The CHAIRMAN. If that policy were followed out.

Mr. SCHLEMMER. That is correct.

The CHAIRMAN. That is what I am interested in, what are you doing. I am interested in what you claim you have the right to do, but it is far more important to know what the facts really are.

Mr. SCHLEMMER. Well, the sense of that clause is, as Mr. Volpe has indicated, the use of the building for the operation of a specific kind or type of business. Now, I think it is true that this lease is consistent with leases used by large realtors, insurance organizations.

The CHAIRMAN. I do not think you will find the operation of the business set out, that they have a right—the lessor has the right—to control the operation of the business. I think he has a right, the lessor—and this is common—that the lessor, in renting the store, can rent it for a specific purpose.

Mr. SCHLEMMER. That is the intent of this clause, Mr. Chairman.

The CHAIRMAN. That is frequently done, but no landlord that I have known claims the right, unless he has a peculiar percentage lease of some kind, and these are not percentage leases——

Senator HICKENLOOPER. Yes; they are.

The CHAIRMAN. Percentage——

Mr. SCHLEMMER. The rental is a percentage of the gross.

The CHAIRMAN. Percentage of the gross?

Mr. SCHLEMMER. Yes. However, we exercise no function of any nature with respect to the operation of the business.

Senator HICKENLOOPER. Do you not have a policy in the operation of these stores and facilities there that a certain general level of prices will not be exceeded in various commodities, and do you not check that with competitive buying in other communities and have that restriction on these stores?

Mr. SCHLEMMER. Our desire in that respect, Senator Hickenlooper, is to get additional businesses in the community so that the competition will control prices.

Senator HICKENLOOPER. I am not asking what your desire is. Do you not actually put into practice that kind of a restriction on the facilities, the drug stores and the various other community facilities in many cases, that the level of prices shall not exceed a certain general level based upon competitive experience in other communities?

Mr. SCHLEMMER. If I recall correctly, there is a stipulation in the bid invitation which refers to price level comparisons, and so forth. Is that not correct?

Mr. PROUT. That is correct.

Senator HICKENLOOPER. And, as a matter of fact, do you not maintain periodic shopping investigations in various other places to see whether or not prices in the facilities there do not exceed those competitive prices in other communities?

Mr. SCHLEMMER. That I cannot answer, Senator Hickenlooper.

Senator HICKENLOOPER. Well, I am informed that it definitely is the case in some other installations of the AEC, and inheres as part of the regulations over the doing of business by those concessionnaires.

I was just interested in whether or not you had that practice in Hanford, and you say you do not know whether there is that practice.

Mr. SCHLEMMER. That is correct.

The CHAIRMAN. Do you know, Mr. Prout?

Mr. PROUT. I never have heard of it, Senator. I have no knowledge of our doing it.

Senator HICKENLOOPER. Let me ask you this, Mr. Schlemmer:

All of this talk about this being a peculiar community is utterly beside the point under the free-enterprise theory.

Richland is an open town. Let us say that a town design has been laid out, and I understand you have recently published a very substantial brochure or book showing the future programing or planning of Richland over an extensive—or that area over a very extensive area, very extensive territory; is that true?

Mr. SCHLEMMER. We have not published any such thing; no, sir, that is not true. We have had a master plan prepared.

Senator HICKENLOOPER. Well, I am supposed to have one by the morning. I do not have one at the moment.

Assuming, as I think it is perfectly correct, that you have zoned the area which, in any kind of good town management, would include certain zones for certain types of business, any zoning plan of a city says that within certain boundaries there will be permitted stores of such a type, retail merchandising stores, and other areas will have light industrial establishments, there will be other areas zoned for heavy industry, there will be areas zoned for office buildings, and other things of that kind.

They may come under the light-industry zoning, but the zoning is pretty well defined in city planning, and it is not a new thing.

Mr. SCHLEMMER. We recognize that.

Senator HICKENLOOPER. Now, then, is there any reason why an examination of that territory there and the plan of that open city cannot be reflected in a dollars-and-cents factor in which the Government that owns the land and knows the planning cannot say, "We will furnish the municipality facilities, the police protection, the fire protection; we will furnish what would correspond to the public water system, and the sewage system that normally are the municipal activity. We take the place of the private utility in furnishing electricity and, perhaps, gas," those are all reflected in the operating costs of this area, and establish a factor in dollars and cents reflecting indeed better locations or poorer locations, just as the price of the rental of a lot down here in Washington reflects all those things, when a man wants to establish an independent business enterprise? You cannot put a price tag on that, and a man comes in and says, "I want to establish a business within the zoning limitations in this area. Here is a lot, or here is a lot. How much is it? What is it going to cost me a year," and if he steps up and pays the price and can give the guaranties that he can put up a building within the requirements for the general type of architecture and construction and fire hazard and all those things which are normal municipal functions, is there any reason why the fellow cannot come up and say, "I will take this lot"?

The CHAIRMAN. Would you look at his character, Senator? Would you make an examination of it in view of the fact that this is Hanford?

Senator HICKENLOOPER. Well, the question of looking at a man's

character in a case of free enterprise is certainly a difficult thing. He might be a severe critic of the General Electric Co. or of the Atomic Energy Commission, and they might, in looking at his character, or exercising their selectivity, as they do now, say "No, we do not want any critics in here. We want only people who are harmonious," and they might say, "For this reason, this character is not good."

The CHAIRMAN. I agree they might abuse their discretion in the matter. I also share your desire to see to it that every part of the free enterprise system can be carried on in this free enterprise. The act was so written, as is indicated on every page, to harmonize the terrible inconsistencies that this thing produces with our free-enterprise system.

There are things we did in this act that we certainly would not have done if it was not atomic energy we were dealing with. It is true that the General Electric Co. might, and the Commission might abuse their discretion in passing upon people coming in there, but because atomic energy is what it is, and because Hanford is what it is, I do not see how we can absolve the Commission or the company, as the contractor, from a high degree of responsibility to see to it that people of good character came in there.

You and I know towns in the United States, without naming them, where there is an undue proportion of, shall we say, questionable characters operating businesses. I should think it would be highly necessary in their enterprise to see to it that the people who came in there were people of good character; and I hope they are screened, on my part; I hope they are screened pretty carefully, because while it is true that while people can visit there and visit houses and visit homes, it is also true that we do not want the kind of people in there, the people whose homes are screened, and very carefully screened and, therefore, we do not want disreputable people setting up places of amusement, and other places where questionable activities might be carried on. We are not operating Chillicothe, Ohio, or my home town of Norwalk, Conn. We are operating a facility which is sui generis in this country, and it raises problems just as peculiar, in my opinion, as almost any other phase of the work connected with atomic energy.

Senator HICKENLOOPER. The question of the character of an individual and the character of the business that he operates are two different things. Manifestly, a man, that is, with some bad record behind him, can conceivably come in and operate a perfectly legitimate business and do it economically and competitively.

The CHAIRMAN. Yes, and have in the back room a place where characters might congregate that we do not want around there.

Senator HICKENLOOPER. Yes; but that can happen any place, and that is part of the police duties of our municipality to see those things do not happen, and manifestly, just as any business lease contains, must contain, a provision that no business of illegal character be operated, that is from time immemorial something which has been there, has been a provision in leases; but it is the selectivity and the utter lack of freedom.

For instance, I think the statement was made a moment ago that eighty-some bids were received, and only 40 were granted.

Mr. SCHLEMMER. Of course, Senator Hickenlooper, some of those were unsuccessful bidders.

Senator HICKENLOOPER. Why should they be unsuccessful bidders if there should be a standardized or a fair price put on the location? Why make any selectivity at all? If there are three restaurants in a block, and if the Atomic Energy Commission and General Electric say, "We do not need more than three restaurants in a block," why should they put that limitation on if somebody wants to come in and put up another building and start another restaurant and take his chances?

Mr. SCHLEMMER. There is just one theory, one fact, which is omitted in the theory which you are expressing, Senator Hickenlooper, and that is the matter of housing.

The housing facilities at Hanford are provided specifically for employees engaged in the operation of the Hanford project. The existing facilities have been totally inadequate up to now.

Senator HICKENLOOPER. They have been in Washington and every other large city in the last several years, but the private enterpriser has a responsibility to find his own method of living, and if he wants to live some place else and operate a business where land is available, that is his job; that is not the job of the Atomic Energy Commission necessarily.

The CHAIRMAN. It is now 1:07. I want you to make an inquiry as to whether you have ever exercised this control spoken of in the lease, and if so, what the nature of the action was which was done under that power.

Mr. SCHLEMMER. Very good, sir.

The CHAIRMAN. I want that, and I think we had better have it as quickly as possible. If you get it to me, I will release it to the press.

Mr. SCHLEMMER. All right, sir.

Senator HICKENLOOPER. Just one thing before we go, Mr. Chairman: I asked yesterday for the verification of a copy—I have a copy that was furnished to me as a copy of a communication from Mr. C. W. J. Wende addressed to Mr. Greninger, under date of March 28, 1949. I wonder if that verification is here? Would you care to compare my copy with that?

Mr. PROUT. I will give you this copy which is certified.

Senator HICKENLOOPER. All right, fine, thank you.

The CHAIRMAN. All right, we will meet tomorrow morning in this room at 10:30.

(Whereupon, at 1:10 p. m., the joint committee adjourned, to reconvene at 10:30 a. m., Thursday, June 23, 1949.)

# INVESTIGATION INTO THE UNITED STATES ATOMIC ENERGY PROJECT

---

THURSDAY, JUNE 23, 1949

CONGRESS OF THE UNITED STATES,  
JOINT COMMITTEE ON ATOMIC ENERGY,  
*Washington, D. C.*

The joint committee met, pursuant to adjournment, at 10:35 a. m., in the Caucus Room, Senate Office Building, Washington, D. C., Senator Brien McMahon (chairman) presiding.

Present: Senator McMahon (chairman), Representative Durham (vice chairman), Senators Vandenberg, Knowland, and Hickenlooper, Representatives Holifield, Elston, and Cole.

Also present: Sumner T. Pike, Commissioner; Lewis L. Strauss, Commissioner; Gordon E. Dean, Commissioner; Henry D. Smyth, Commissioner; Carroll L. Wilson, General Manager; Carleton Shugg, Deputy General Manager; Frances Henderson, Assistant to the Chairman; Brig. Gen. James McCormack, Jr., Director, Division of Military Application; Walter J. Williams, Director, and Carroll Towne, Division of Production; Joseph Volpe, Jr., General Counsel; Bennett Boskey and Everett L. Hollis, Office of the General Counsel; Fletcher Waller, Director, Division of Organization and Personnel; Morse Salisbury, Director, and Rodney L. Southwick, Division of Public and Technical Information Service; Edward Brosnan, Division of Security; Fred C. Schlemmer, Manager, Lloyd Bergeson, Assistant to Manager, and Charles Schank, Chief, Finance Division, Hanford Operations Office; Carroll L. Tyler, Manager, and John Macy, Director, Organization and Personnel, Los Alamos Operations Office; Richard W. Cook, Acting Manager, S. H. Sapiirie, Chief of Engineering and Production, and Fred W. Ford, Director of Community Affairs, Oak Ridge Operations Office; all of the United States Atomic Energy Commission:

George R. Prout, Vice President and General Manager, Nucleonics Department, H. W. Winne, Vice President in Charge of Engineering, Forrest E. Baker, Comptroller, Nucleonics Department (Hanford Works), Robert S. Neblett, Assistant General Manager, Nucleonics Department, Schenectady, N. Y., and Robert Milton, Washington representative of the General Electric Co.

Clark Center, General Superintendent, William B. Humes, Superintendent, K-25, Clarence E. Larson, Superintendent, Y-12, Oral Rinehart, Controller, Fred Uffleman, Supervisor of Materials Control Department, Y-12, E. N. McKay, Superintendent of Product Processing and Product Chemical Department, Y-12, J. M. Herndon, Superintendent of Chemical Division, Y-12, and Logan Emlett, Superin-

tendent, Operations Division, Oak Ridge National Laboratory, of the Carbide & Carbon Chemicals Corp. (Oak Ridge).

Clinton Hernandez, Vice President, Lyle D. Worrell, Assistant Project Manager, L. C. MacNeal, Project Manager, and St. John W. Davis, Audit and Budget Division Manager, of the Roane-Anderson Co. (Oak Ridge).

The CHAIRMAN. The committee will come to order.

**STATEMENT OF FRED C. SCHLEMMER, MANAGER, HANFORD OPERATIONS OFFICE, ACCOMPANIED BY CARLETON SHUGG, DEPUTY GENERAL MANAGER, JOSEPH VOLPE, JR., GENERAL COUNSEL, AND LLOYD BERGESON, ASSISTANT TO MANAGER, HANFORD OPERATIONS OFFICE, ALL OF THE UNITED STATES ATOMIC ENERGY COMMISSION; H. A. WINNE, VICE PRESIDENT IN CHARGE OF ENGINEERING, F. E. BAKER, COMPTROLLER, AND G. R. PROUT, VICE PRESIDENT, NUCLEONICS DEPARTMENT, GENERAL ELECTRIC CO.**

The CHAIRMAN. Mr. Schlemmer, do you have with you the answer to the question that I directed yesterday concerning what you had done under the power of your contract in the way of controlling businesses?

Mr. SCHLEMMER. Mr. Chairman, Mr. Shugg has that information, and since it was developed under his administration of Hanford, if you are agreeable, he is prepared to discuss that subject.

The CHAIRMAN. Yes.

Mr. SHUGG. Mr. Chairman and members of the committee, in answer to the direct question as to direct action by us, on our part with respect to the role of the concessionaires, the most specific instance that occurred during my administration was one which I initiated myself about July 1948, when I directed that a spot-check survey be made of the prices being charged by the one-of-a-kind concessionaries then doing business, as compared to the surrounding towns.

That was a spot-check survey which I initiated, and let it be obvious that we were doing it. There is a little background to that which I would like to tell you about.

We had a flood there, which cut off our only access road to the south for 6 weeks; and, while that was cut off, it occasioned a 30-mile detour to the west, to the nearest outside shopping town; and during that period we had complaints that some of the merchants were taking advantage of the situation by hiking prices.

Now, I had this spot check made. It went on through the month of July. We were probably slow in initiating it. It did not show any hiking of prices except possibly in the instance of one chain store, and we compared the prices in that chain store with some prices for the same products in its own branches in nearby towns, and called that to the attention of the General Electric concession department, and asked them to have that operator explain those prices. No other action was necessary.

That is the only official show of interest into the day-to-day operation of the business. I did have many informal instances where we took a day-to-day interest because of the jam that we were in as the town expanded.

We were increasing from 11,000 to 36,000 as a total in a little less than 18 months; and, as soon as we opened up this thing, waiting lines grew up all around.

I myself lived in the town at the hotel, and ate at the cafeteria, and I definitely suggested to the cafeteria manager, for instance, watching the long morning line there, that he open up an unused part of the bench for coffee and doughnuts only. That sort of suggestion was meant to be constructive, and it occurred frequently.

One of the earliest things I did was to contact in a discussion session the chamber of commerce to find out what their top needs were. We could not satisfy them all, and almost the unanimous top one was to enlist our support in getting a liquor store into town, because the people were going so far away to the only State liquor store, and we did get in a Washington State liquor store.

The CHAIRMAN. Thank you.

Senator HICKENLOOPER?

Senator HICKENLOOPER. At that time, Mr. Shugg, were all these businesses operating in Government-owned facilities?

Mr. SHUGG. Yes, sir. We had not the first one yet that they had put up with their own money.

Senator HICKENLOOPER. And under that theory where they were operating under Government-owned facilities they were under Government sponsorship in that, as differentiated from the situation where a man in a free-enterprise system builds his own buildings and is responsible for his own success or failure on a competitive market.

Mr. SHUGG. I think that is right, sir. There were almost the situations where every coin that we looked at had two sides to it there.

We had not opened up new tracts, which commercial businesses could come on; we did not give that first priority in our use of men and materials, and since we, in effect, were the bottlenecks in assigning the use of men and materials to opening up the business end of the town, we had to take some interest in extending the present businesses to be as useful as possible.

We had discussions as to the hours, as to whether we could stagger shifts, and the bus service.

Senator HICKENLOOPER. I am not raising any question about the very tight situation which existed originally, where the only facilities were owned by the Government. The Government felt it was responsible to get facilities in there for what one might say are emergency services to a growing population, and under those circumstances, where the Government owns all the facilities, and the facilities are limited, then, I think, that the operation out there had some responsibility to see to the proper installation of adequate facilities or as many as they could.

The thing that I am talking about now, and the point I am raising now, is not on that question. That question was raised in Oak Ridge; that question was raised in Los Alamos, and has been raised heretofore in all of these originally peculiar installations.

What I am raising is that it is no longer a peculiar installation; that is, the town has been opened; land is available, and theoretically a free-enterprise system should be operated, and people are willing, or at least alleged that they are willing to invest their own money and build their own buildings, subject to such normal and ordinary mu-

nicipal regulations, such as fire hazards and zoning and things of that kind; and I am raising the question and objecting to the continued control over a free-enterprise operation which is lawful, of course, assuming all of these would be lawful, where a free enterpriser is willing to invest his money, and then it should be allowed, and he should be permitted to conduct his own business in a lawful way in a competitive system.

Now, I am fully aware of the difficult situation in the inception of these plants, the necessity for serving a growing and an uncertain community in Government facilities, and I may say parenthetically at this time that the situation at Los Alamos, I think, is completely different from the situation either in Hanford or in Oak Ridge, because Los Alamos sits on top of a postage-stamp-sized mesa, and certainly everyone knows, who has ever been there, that there is a complete limitation on ground and expansion and everything else, and of vital necessity, I think, those towns—that town—has to be given a different consideration because of that complete limitation on any expansion possibilities there insofar as a free enterpriser is concerned.

But I do not believe that situation obtains at Hanford, and I do not believe it obtains at Oak Ridge.

Mr. SHUGG. I think, Senator, also that my administration—if you can call it that—was responsible for a good deal of the rate of this expansion which was taking place this spring.

When we set this up in the early summer of 1948, I did believe, and still do, sir, that we had to control the rate of expansion in that we had two extremes facing us.

We had initially, and as of last June only, I think it was, 37 concessions in town. We were passing the 25,000 mark, and we checked a town almost identical, Walla Walla, and they had almost exactly 10 times the number of same concessions. If we have 37, they had 370; that is why I remember it. So, we had this little, inadequate initial set-up, and then right outside the south border of the Yakima, an example of what absolutely wide open a situation could do.

We had at the "Y" and crossroads, and the town roads between Kennewick and Pasco—there was the most flagrant example of a boom town and tent town that had sprung up there.

Now, we had one other thing that made us feel that we had to control the rate of expansion. We had to spend money, sir, in order to make land available for commercial purposes. Except for a few gaps in the generous spacing of the initial 37 outfits, we had to start with sagebrush, and we had to go to work and grade that, and put in streets and utilities and all the services in order to make more land available; and we were frankly trying to divert as little men and materials to that as we could, and we set aside a limited space, sir, and, therefore, we did control the rate of the new people coming in there.

Senator HICKENLOOPER. I understand those earlier problems; at least, they appeal to me as having a reasonable support for your theory that you are talking about. I think you and I have talked about that before. It is not the emergent situation that I am talking about. It is the situation which has now developed where Hanford is an open town, and if Walla Walla or a similar-sized town has 10 times as many

stores under a free-enterprise system, it would seem to me, that if under proper civic regulations, so far as the type of structure is concerned, so far as the zoning regulations are concerned, and fire hazards and all those municipal responsibilities that the ordinary municipality has to have, it would seem to me that the value of a piece of land for utility for a type of business, light industrial, heavy industrial, commercial, professional or other types—it would seem to me—that the value of that could be easily fixed by a yardstick, and then just to keep hands off as long as the fellow paid the amount that was considered to be adequate in lieu of what he would pay by way of taxes and other things and rental for the land in a normal community, and that in that kind of city, the normal number of service establishments and the normal number of professional and other type of businesses should not be curtailed in any way, but should be limited by free competition, and the ability of a man to make a go of it either by good prices, good merchandising, or other practices, without supervision and control by either the company or by the Government. He should pay a reasonable return for that, and it should reflect, of course, a reasonable and proper amount on municipal management.

I do not say that he should be given it for nothing, but it is a matter of the superimposing of either company control over his activities or company limitation on the number, and I see no reason why the company should say that there should only be three cleaning establishments in the place. I am only using that as an arbitrary number.

There is no reason to say, "We have got eight grocery stores, and we do not need any more, and we will not let anybody else in there."

If 20 people want to set up grocery stores, and if they have the finances to build the proper kind of buildings and pay the proper charges, reflecting on the services, the municipal services they get, it would seem to me that free enterprise ought to be able to operate, and that competitive operation should be left to regulate the number.

Mr. SHUGG. Senator, even at this stage, sir, I do not think we know enough about the value of business lots in Richland to be able to put them on a market—to know the market enough to put them on a flat rate.

We chose, whether it was good or bad judgment, the form of lease which, I am sure, is quite common, and that is a percentage of gross, and that is used elsewhere, and it does have some benefits to the lessee as well as the lessor.

Senator HICKENLOOPER. I think, Mr. Shugg, that it is quite common practice in any city or town of size that has hopes of expansion or an uncertain future, I think it is quite common practice to put a rent—which this would be; we will call it rent to take in all of the charges—renegotiation feature in that contract periodically from time to time based upon certain things; based upon the increase in the population, based upon increased costs of municipal operation, based upon tax raises, and all those things. I mean that in private enterprise can be done by a yardstick, and I do not think that there is any owner of a desirable business lot in a prospectively growing city but what protects himself, and by the same token the tenant wants to protect himself against a recession in that town either of population or lower costs, and it would seem to me that it would be very easy to work out a contract on that basis, so that an investor would know what the future would be, what he could rely upon in the future.

But then, I do not care to pursue that any further. I think we have exhausted that quite enough.

Mr. VOLPE. Mr. Chairman, I wonder if I might comment on this point for just a moment?

The difference here is that the Government is a landlord. If the Government were in a position to sell land, then all of the things that Senator Hickenlooper says are quite true and quite right. You could sell the land for a fair price, and private industry, private commercial facilities, could do what they would want to do with the property.

But here the Government is a landlord, and as a landlord, the Government has to use its property in a prudent fashion.

Now, I would like to, just for a moment, read from a publication put out by the National Institute of Real Estate Brokers of the National Association of Real Estate Boards on the matter of percentage leases. It is quite a common practice, and in one article here by J. F. Brownlow, it says:

The strongest trend of percentage leasing will continue to be the introduction of special provisions tending to produce either true rental value or premature cancellation. This means that we must first discard the idea that there is such a thing as a standard percentage lease applicable to any great number of cases. The standard lease forms are valuable in giving particular provisions, but the final lease will probably be a mosaic.

Throughout the problem of landlord and tenancy, that is, the working out of arrangements, the National Institute of Real Estate Brokers in this book—and I would be very happy to leave it with the committee—points out the difficulties of arriving at an equitable arrangement so that the tenant has all the things that he needs to conduct a good business, and that the landlord, at the same time, is protected so that he gets a fair return on the value of the property.

There was some talk here yesterday about a provision in our lease which would require the lessee to conduct his business in an orderly way. I would like to read a clause which is proposed by the National Institute of Real Estate Brokers. The clause reads as follows:

Lessee shall during the entire term continuously use the demised premises for the purposes stated in this lease, carrying on therein lessee's business undertaking diligently, assiduously, and energetically. Lessee shall maintain on the premises a substantial number of goods, wares, and merchandise and equipment adequate to assure successful operation of lessee's business, and shall employ clerks, salesmen, and others sufficient for the service and convenience of customers. Lessee shall keep the premises open and available for business activity therein during all usual days and hours for such business in the vicinity except when prevented by strikes, fire, casualty or other causes beyond lessee's reasonable control, and except during reasonable periods for repairing, cleaning, and decorating the premises. Lessee shall include the address and identity of its business activity in the demised premises in all advertisements made by lessee in which the address and identity of any other local business activity of like character conducted by lessee shall be mentioned, and shall not divert elsewhere any trade, commerce or business which ordinarily would be transacted by lessee in or from the demised premises. Lessee covenants and agrees that he will expend annually for newspaper, radio, and other mediums of publicity not less than a sum equal to 2 percent of the gross volume of business transacted in demised premises.

Senator HICKENLOOPER. There is nothing new in those regulations, with the exception of certain variables. I do not believe it is customary to put in an advertising budget in the lease. That is the recommendation, but all the rest of those are in every standard lease,

at least as long as I have known anything about practicing law since about 1922. It is a perfectly standard provision; they are perfectly standard provisions. No one was objecting to that in the least.

Mr. VOLPE. No; my only point in that, Senator Hickenlooper, is this suggestion that the Government is no different from anyone else—we are a landlord. There is a landlord-tenant relationship about this.

Senator HICKENLOOPER. But you never say customarily or put into a private lease the provision that the tenant would run his business according to the regulations from time to time issued by the landlord?

Mr. VOLPE. Well; Senator, there is even an answer to that.

Senator HICKENLOOPER. I figured there would be. [Laughter.]

Mr. VOLPE. Here is a selected percentage lease contract suggested by the National Institute of Real Estate Brokers. I would like to read this provision:

Lessee agrees to obey and conform to all laws, ordinances, rules, regulations or orders of all duly constituted authorities of the city, county, State, and Federal Governments, and of all public utilities.

Senator HICKENLOOPER. That is a perfectly normal provision in a lease, because it recognizes the legal sovereignty of certain bodies to regulate from time to time by ordinance, or by statute or others, and most leases contain a provision if the State law changes with respect to that business—it contains a covenant which probably is unnecessary in a lease, but it contains a covenant that the tenant will immediately and strictly adhere to any changes in State law. But it does not say that if a landlord comes down some Monday morning with a hang-over or something, and has not liked his tenant very long and very well, and gives him some whimsical or personally conceived orders as to what to do about his business, that the fellow has to follow them.

Mr. VOLPE. Well, Senator, again here I am afraid we are overlooking this fact. In this situation the Government is not only the landlord, but the Government is also the municipality; the Government is also the governing authority, and the Government here issues rules and regulations with respect to how this municipality is to carry on its affairs. I mean the regulation of traffic and things like that is carried on by the Government, so that again we have a very peculiar situation where the landlord is not only the landlord but he is also the municipality; he is also the governing body for the issuance of rules and regulations which govern the community.

Now, as I said yesterday, nobody likes this, and I agree with your statement and with Senator Millikin's statement about authority of this kind—and there is broad authority, there is no question about that—I think the guts of this is how has it been exercised; and I believe an inquiry into how it has been exercised will show that it has been exercised reasonably, not whimsically, not arbitrarily or capriciously.

Senator HICKENLOOPER. Of course, that is always the argument of paternalism. The argument is that we have been kind paternalistically in the past and, therefore, the broad authority will not be overextended in the future.

So far as I am concerned, Mr. Chairman, unless there is something else which is pertinent, I would like to go on.

The CHAIRMAN. All right, let us get on with the next matter.

Senator HICKENLOOPER. Mr. Chairman, I have had, as I have repeatedly said, the greatest respect for the scientific accomplishments in this whole atom project.

I have had the greatest respect for the integrity that the scientific fraternity has brought to the completion of the technical job of producing atomic energy, and I think the scientists have done a magnificent job, and I think they are continuing to do so.

I have not raised any question about scientific activity in actual production, but I do feel that certain things are important in the administration of this vast enterprise, and some time ago I learned that the Director of Pile Technology at Hanford resigned, and that he had stated his reasons for resigning.

I asked the joint committee staff to secure for me a copy of Dr. C. W. J. Wende's letter of resignation from the Commission. I had never seen it until it was furnished to me through the joint committee staff by the Commission. The letter is not classified; there is no classification, and it is a letter of resignation by Dr. Wende.

Dr. Wende, as taken from American Men of Science in 1944, is, I believe, an able, a highly able, one of the most highly able scientists in his line in this country. He has a doctor's degree, and he was a Dupont Fellow, and a member of the American Chemical Society, and he has had experience in the physics of the high polymers; that he was Director of Pile Technology at Hanford.

For the last 2 weeks I have been attempting—almost 2 weeks; it has been 10 days—to locate Dr. Wende. I have telephoned all over the United States repeatedly.

From his residence in the Middle West I was told that a few days ago Dr. Wende and his wife had left about the middle of June for a camping trip throughout the West; that he had no place of location, and that he was probably camping beside a stream some place and doing a little fishing or things of that kind.

I have been unable to locate Dr. Wende, but I have an authenticated copy of his letter of resignation, not only as furnished by the Commission, but an authenticated copy certified as true by the General Electric Co.

Therefore, my inability to locate Dr. Wende—and I would certainly welcome Dr. Wende's appearance here at some time in the future when he gets through with fishing or vacationing or whatever he is doing, and he and his wife return—but I would like to read for the record at this time Dr. Wende's letter of resignation directed to the General Electric Co. This is dated March 28, 1949, and it is headed as follows:

RICHLAND, WASH., *March 28, 1949.*

Dr. A. B. GRENINGER,

*Manager, Technical Divisions, General Electric Co.,*

*Richland, Wash.*

DEAR AL: Please consider this my resignation from the Hanford Works.

A few details which have been neglected under the pressures of the last few years remain to be cleaned up; however, I expect that these can be put in good shape within a couple of months; and a firm date for termination can be agreed on later. A reorganization of the Pile Technology Division should be put into effect within the next few weeks.

In recognition of an obligation to the company and to your colleagues in management, I have summarized the reasons for this action. I do this reluctantly and with considerable pessimism, for I can see no chance that the future course of events will be affected. I have made no secret of these convictions in discussions with yourself and my other friends in General Electric management,

though I have been guilty of painting a much brighter picture to my subordinates. I should say that this picture was colored rather highly by considerations which are technical and scientific, and are therefore irrelevant to the present discussion.

Many of these points I expressed to you in my letter of August 30, 1948, and subsequently stated before the Nucleonics Committee. At that time I felt that a concerted tug at our bootstraps might do some real good, and asked to be put on special assignment to develop a pile program for Hanford, in the hope that one nucleus might start a crystallization process which ultimately would bring some semblance of order into the amorphous complex of our relations with the Commission.

This mission was abortive. As you know, urgent operating problems interfered with it twice; and since my return additional crises have kept me well back on my heels. My report has not yet gone beyond the stage of a partial rough draft.

In the course of this assignment, however, I became convinced that one of the primary shortcomings of the Commission set-up is that nowhere in it is there a hard knot of practical business sense of the kind that can effectively manage a program of industrial development. Such know-how appears to be alien to governmental agencies, and must of necessity come from industry. Of the possible sources, the General Electric Co., having the biggest stake in the business, has the most to contribute and the most to gain by acting as such a nucleating force.

I expressed this view, among others, to Messrs. Muir, Suits, and Winne, who felt that it was sound.

The chance that we might swing this much weight with the Commission has now gone glimmering. Having had our own house tumble about our ears, we are in no position to recommend ourselves as architects.

Our present difficulty, and the worse ones which are bound to follow it, are clearly the outcome of a lack of direction which has let us get overextended. We have tackled a gigantic job with an organization which has been weak and will continue to be weak for several reasons:

1. General Electric inherited with this plant an organization which was below a safe minimum strength for routine operation. At the same time, the company had relatively little high-grade talent which could be spared from its own organization.

2. There was excessive upgrading to obtain a partial fill-in of key positions.

3. There appeared to be some reluctance to pay the necessary premium prices for new talent of high caliber.

The job itself has grown to overwhelming proportions for another set of reasons:

1. There has been no clearly defined body of men charged exclusively with planning, programming, and policy making. Hence, these important functions have been neglected in the press of other duties.

2. Lacking a coherent program of its own, having no realistic evaluation of its own limited capabilities, but nevertheless being strongly impelled to do its utmost for the good of the Nation, this organization has accepted every demand placed on it by the Commission.

3. These demands have been accepted without extracting from the Commission any assurances that the necessary manpower and facilities would be provided, and without insisting on realistic time schedules.

The unfortunate but predictable resultant of these factors is that the company has for some time been committed to do things which exceed its abilities. From the standpoint of one who is far enough down the line to get an ear to the ground occasionally, it can be said that the prospect which we now face appears to be dominated by the following factors:

1. A number of good men, having thrown their best energies into this job under the conviction that it is an important job, have seen it handled as though it were unimportant. Good men are sensitive to such things; drones are not. The consequences of this will have to be lived with for a long time.

2. Nothing short of the most fanatical interest in nucleonics, or a war, will attract and hold capable technical personnel in the face of adverse working conditions and crisis upon crisis.

3. It takes a little foresight to see that the present drift will lead to fiascos which will far overshadow the current budgetary crisis. Having warned of such dangers, I have very reluctantly become convinced that there is little I can do to forestall their further development.

My own part of the organization has in it more real power than any other division on the plant; yet it has always been and will continue to be adequate to

do only a ragged fraction of the job that is set before it. What successes we have had have come because the boys put their hearts into every pitch. I have told them that they are the hottest crew in the business; they believe this, as I do, and they have performed like champions. But I do not propose to stand by while such a crew is continually swamped by jobs which could be diverted elsewhere or delayed by a little astute horse trading, or to ask them to continue to operate on a shoestring when every principle of sound management demands that they be given hawfers.

By giving what assistance I could during the crises of the past 2½ years, I feel that I have discharged my duties as an employee and a citizen. There is, however, a limit to anyone's capacity for crises. I have met my part of the challenge which faces the company and the Commission; to meet this challenge in its entirety will require many men of my size plus many more men who are much bigger, faster, and smarter. Few of these are within sight.

I consider it as important to be aware of one's limitations as it is to be aware of one's potentialities; there can be no greater failure than to be trapped outside the limits which those things impose.

It is for these reasons that I am submitting my resignation. I sincerely hope that a solution can be found, but I am as sincerely convinced that a solution cannot exist without a radical change whose shape I cannot foresee.

Aside from these discouraging and perhaps unavoidable complications, my association with your divisions and with the General Electric Co. has been very pleasant. I feel a very deep regret in leaving my many friends here, but I know that both they and I would feel a far deeper regret if I failed to back my own judgment.

I sincerely hope that ways will be found to assure you and the company of every success in the future.

Very truly yours,

C. W. J. WENDE.

Again, Mr. Chairman, may I say that I do not have the original letter of Mr. Wendé, so that I do not have his actual signature, but I have the certification of General Electric Co. that this is a true copy of his original letter of resignation.

I have one other matter that I might just as well put in here for discussion at the moment.

A few days ago—well, apparently more than a few days ago—I received it on June 7, 1949, I received a letter of transmittal enclosing a copy of another letter, in fact, a copy of two other letters, from a Mr. Merle E. Smith, who is a member of the Hanford guard force, and is president of Hanford Guards' Union, Local No. 21, at Hanford. This letter is as follows:

Post Office Box 687.

The letterheading is:

Hanford Guards' Union, Local 21, International Guards' Union of America, Richland, Wash., May 30, 1949.

To: Senator Bourke Hickenlooper, Senate Office, Washington, D. C.

From: Merle E. Smith, president, Hanford Guards' Union, Local No. 21, Richland, Wash.

Subject: Security at Hanford.

DEAR SENATOR: I am sending herewith copy of letter sent to Fulton Lewis, Jr. I believe the letter is self-explanatory. Knowing your interest in the atomic picture, I felt that this letter might be of interest to you.

Respectfully,

MERLE E. SMITH,  
Richland, Wash.

A copy of the letter, which I will submit for the record here, to which he refers, has a heading:

HANFORD GUARDS' UNION, LOCAL 21,  
INTERNATIONAL GUARDS' UNION OF AMERICA,  
May 30, 1949.

To: Fulton Lewis, Jr.

From: Merle E. Smith, president, Hanford Guards' Union, Local 21, 808 Sanford, Richland, Wash.

Subject: Security at Hanford.

DEAR MR. LEWIS: Your recent broadcast exposing the laxness of security in one of the Nation's largest atomic plants, together with the subsequent newspaper publicity, is my reason for writing you.

I am a member of the Hanford guards and have been employed here as a guard since August 1943. Your broadcast and the various news items have accentuated the fact that two uranium slugs were carried by an individual through three guard posts with guards on duty. As a result, in the minds of many people, the Hanford guards are pictured as inefficient and guilty of failure in the performance of their duty.

Allow me a word in our defense. I do not believe that there is a single patrolman or patrol officer on the Hanford works' guard who has not been appalled by the security laxness which has existed for some time and still exists. Unfortunately, patrol supervision is allowed little or no voice in the policies laid down for the security of this plant.

These policies are drawn up by the Security Department, headed I believe by Mr. F. C. Schlemmer.

I may say parenthetically that I do not know whether Mr. Schlemmer is charged with that responsibility or not, but that is just what the letter says. I will continue quoting:

We obey and follow the rules laid down by this department.

How could a man walk through three guard posts carrying two slugs of uranium? At two of these posts, there are no orders calling for a search of people entering or leaving. At only one of these posts may a superficial spot search be made. By superficial, I mean a pat search. Spot searching means the searching of perhaps one out of five individuals. For the past year even this type of search has been practically discontinued. Recent developments have brought spot searching back into the picture.

It was my duty recently to spot search an incoming and an outgoing shift. I succeeded in spot searching approximately 7 percent of the incoming shift. When the same shift left I succeeded in spot searching only 5 percent. Perhaps this performance will explain why the uranium-bearing gentleman was not discovered.

Who is responsible for this condition in the security department or departments? The AEC and General Electric both maintain such departments. Some weeks ago some 20 percent of the Hanford patrol force was terminated by order of the security departments. As a consequence of these terminations, we are very shorthanded, and, of necessity, posts have been undermanned or not manned at all. Suggestions both verbal and written have been offered by both patrolmen and patrol officers, pointing out security weaknesses. I am enclosing one of my own suggestions, which is self-explanatory.

You have built up a reputation for fairness and justice. Perhaps you could in some way place the responsibility for the condition, which permitted the incidents related in your broadcast, upon the person, or persons responsible. I know that the Hanford guards, both the patrolmen and officers, would welcome the opportunity to do our jobs here in a more efficient manner. We would welcome working under orders which would really stop all leaks of material and information. We have recognized for some time the laxness of security.

I sincerely hope that as a result of your broadcast conditions here will be changed so that the Hanford guards will be allowed to do the job they are capable of doing, thereby safeguarding not only the security of this plant but, in a small way, the security of the Nation.

We will welcome that responsibility, but we do not feel that we, the Hanford Works' patrol, should be held responsible for the unfortunate incidents which prompted your broadcast. That responsibility is squarely on the shoulders of our security departments. I wish to thank Assistant Chief W. H. Pillsbury for assistance rendered me in writing this letter.

Respectfully—

there is typed in—

MERLE E. SMITH.

Copies were sent to Senator Hickenlooper, Senator Harry Cain, Senator Magnuson, and the press.

As I say, I received this letter on the 7th of June, 1949.

The copy of the letter that he refers to as expressing his own views about the matter of some days before is dated May 28.

To: Capt. D. J. Hensley.

From: M. E. Smith, W-6489-SS.

Subject: X—Material.

DEAR SIR: Several patrolmen have informed me that X material has meant to them only something sealed in a package which was carried in or out of areas on a pass. They had actually never seen a so-called slug.

As one patrolman expressed it, "Now I know what I have been looking for." The newspaper described a uranium slug, giving the length, diameter, and weight. This newspaper description gives a rather incomplete picture.

Only once in my several years in 100-F area, have I been instructed about, and allowed to see and handle the various slugs. This occurred some 3 years ago.

I would suggest that all patrolmen with satisfactory clearances be familiarized with X material—slugs. A patrolman will then know what he is looking for, and will recognize irregularities which may occur.

There is a typed signature, or there is typed at the bottom "Merle Smith, W-6489-SS."

I present those for any comments that anyone cares to make.

The CHAIRMAN. Who is going to answer on these two communications?

Mr. SCHLEMMER. Mr. Chairman, Mr. Winne.

The CHAIRMAN. I take it, Mr. Winne, that you are going to comment on the letter of resignation of Dr. Wende?

Mr. WINNE. Yes, Mr. Chairman. That is the one on which I wish to comment.

Dr. Wende, as Senator Hickenlooper has brought out, is a very distinguished scientist, a very able scientist. He has contributed a great deal to the operation of the Hanford Works, and I believe he did to the design and construction, although I have no personal knowledge.

We were very sorry to have him leave our organization, and very sorry to have him leave the atomic energy project. We asked him, when we learned that he was planning to resign—we asked him to come to Schenectady, and Dr. Suits, Dr. Kingdon, myself, and others, talked with him in an endeavor to persuade him to remain in atomic energy work; if not at Hanford, then at the Knolls Atomic Power Laboratory at Schenectady, and Mr. Prout and I talked with him at Hanford also. But his final decision was that he wished to get entirely out of the field of atomic energy; that he was—I do not know exactly how to express it, but that the continual tremendous pressure and crises which he speaks of in his letter, were, in a sense, not getting him down but at least he felt that he had given as much of himself as he should to the meeting of this pressure and of the crises.

Now, of course, we admit there is pressure; we have been working all this while on this job under pressure, both we and the Commission,

and I think that some of the accomplishments that have been made indicate this tremendous pressure, and as I say, Dr. Wende has contributed very materially to that, to our accomplishments.

The thoughts that he expresses in the letter, of course, are his own. Many of them we would not agree with entirely, but I question whether it is worth while to take the time to go all through that here and now, although I would be glad to do so if you so wish.

On the matter of the guard situation and the security situation at Hanford, that is a matter with which I am not so personally familiar, as is Mr. Prout, and I would much rather that he answer on that particular matter.

Senator HICKENLOOPER. Mr. Chairman, I may say with respect to the guard letter, I have a very thick file, indeed, of letters that have come in from various plants. I do not believe that I shall offend this committee nor anyone else by going into anonymous letters that I received, or by going into—that is publicly, at least—or by going into letters that I receive which indicate that the individual has some special ax to grind, or is especially mad at some particular individual.

I did produce this guard's letter on the theory that he signed his name to it; he made it public, and he is president of the Hanford Guards' Union, local No. 21, and I felt that it took that out of the category of some disgruntled, discharged employee, and this gave it a dignity of acceptance which, I felt, in fairness could be proposed here.

I assure you that I have lots of other letters in which it may seem that people have special targets at somebody, and I shall not clutter this record with special pleaders or special missions, but I felt that under the circumstances, and this man's position, his utter frankness and his apparent pride in the guard force, that I was justified in presenting this letter at this time.

The CHAIRMAN. I think you were.

Mr. PROUT. Mr. Chairman, if I might comment to that point—

The CHAIRMAN. Mr. Durham has a question.

Mr. DURHAM. Before you get away from Dr. Wende's letter here, I would like for you to comment on this statement here. He says:

For some time the company has been committed to do things which exceed its abilities.

When he says "the company", he is speaking about the General Electric Co., and I think you people could answer that, as to whether or not you are committed to things beyond your ability. That raises a serious question in my mind.

Mr. WINNE. Well again, Congressman, that, as I say, is Dr. Wende's opinion. The record of our accomplishments in the operation of that plant and the design of additional production facilities for it, which are the features on which Dr. Wende entered into particularly, I am perfectly willing to let speak for itself as to whether we have been overextended.

I think we have demonstrated that we have been capable of operating that plant and of improving the operations very materially, in spite of Dr. Wende's statements.

As I say, Dr. Wende is an able scientist. He is of a scientific temperament, very impatient type of temperament. I say that with no disparagement whatsoever to him, because many of our best scien-

tists have those same characteristics, and I do have a great respect for his scientific and technical ability.

Mr. DURHAM. Well, I have got a very high personal regard for the abilities of your company.

Mr. WINNE. So do I have. Thank you, sir.

Mr. DURHAM. I don't think that charge should be let to go by without answer by the company.

Mr. WINNE. As I say, on those points we can let the record of the accomplishments speak for themselves, Mr. Congressman.

Mr. HOLIFIELD. Mr. Chairman?

The CHAIRMAN. Yes, Mr. Holifield.

Mr. HOLIFIELD. I would refer you, Mr. Winne, to the third from the last paragraph before the signature at the bottom, where he says:

It is for these reasons that I am submitting my resignation. I sincerely hope that a solution can be found, but I am as sincerely convinced that a solution cannot exist without a radical change whose shape I cannot foresee.

In other words, Dr. Wende puts himself in the position of criticizing on various points the operation of your company, the operation of the Hanford project, but he admits in his own letter that he cannot see how it can be changed, so he rather disqualifies himself as a good critic because he criticizes without constructive suggestion as to how it should be done.

Mr. WINNE. I suppose that might be so construed, Congressman.

Senator HICKENLOOPER. Well, of course, Dr. Wende may be like the fellow who said he never laid an egg, but he could tell a good one from a bad one.

Mr. WINNE. Possibly.

Mr. HOLIFIELD. May I say that the Senator may be an expert in the matter of laying eggs, I do not know. [Laughter.]

Senator HICKENLOOPER. Let me say, Mr. Winne, that, so far as General Electric Co. is concerned, I have highest regard for General Electric, which is a great, successful company. I do have the highest regard for it. I think there may come a time before this is over when I will want to discuss with you certain policies over which, perhaps, General Electric may have no control at all.

Mr. WINNE. Of course, I think that is important, for example, Senator, in the policy of the operation of the village and so forth. Those are set out by the Commission, and we follow that to the best of our ability.

Senator HICKENLOOPER. Before this is over, I may want to discuss with you the question of whether or not the policy of Commission operation under which General Electric must be guided is a policy of boldness and long-range vision and speed of decision on major questions, or whether it has been a mincing policy, and a hesitant policy in opening up essential future programs; and I will assure you that in this letter I do not desire to cast aspersions on General Electric. I think that that is a field of inquiry that we can very profitably go into, but I feel that over-all it involves broad policy, of which General Electric may be an implementer within the limitations of its contract. Now, I want to make that clear.

There may be lots of things wrong with General Electric's operation; I am not foreclosing that thing, that end of it.

Mr. WINNE. That is quite possible.

Senator HICKENLOOPER. And I shall feel perfectly free to criticize General Electric if I come to that conclusion in the long run.

Mr. WINNE. We are only human beings.

Senator HICKENLOOPER. But it is the broad over-all policy, and I will say to you my general interpretation of Dr. Wende's letter, that there are limitations which cause frustration and which result in what he believes to be a lack of progress in this program, and it is the broad program that I am concerned with, and it is the fastest reasonable and most progressive strides in atomic energy that I am concerned within the whole structure.

Mr. WINNE. Of course, if I might stay for just a moment on that point—I understand you do not wish to go into it now—but just on this point: Dr. Wende was particularly interested, I think, in the matter of reactor development.

We, of course, see the picture, perhaps, a little bit more broadly than he did, although he was, in general, familiar with what was going on, because in the Knolls Atomic Power Laboratory at Schenectady we have under way in the Commission's general direction a very intensive program of reactor development which we are pushing ahead just as fast as possible.

Senator HICKENLOOPER. Has final determination been made to build that reactor in the remote site at Schenectady?

Mr. WINNE. I do not know whether we have firm authorization to go ahead with that or not, Senator. The Commission is going ahead, I believe, with the acquisition of additional territory there, so that I assume that there is little question but what that reactor will go ahead.

Senator HICKENLOOPER. In view of the present decision on the reactor farm at Arco?

Mr. WINNE. Well, I think that on that point the Commission should answer, Senator. There are certain——

Senator HICKENLOOPER. But, Mr. Winne, you represent General Electric.

Mr. WINNE. Yes, sir.

Senator HICKENLOOPER. I am really asking you whether you know or not whether a firm decision has been made to build the reactor that was contemplated some considerable time ago, and for which \$100,000 or so has been spent to clear stumps off the land, and other things; whether that firm decision has been made, and whether you are authorized to go ahead with that construction of the reactor.

Mr. WINNE. We may be by this time.

Senator HICKENLOOPER. At Schenectady?

Mr. WINNE. I do not know of my personal knowledge, no, Senator. We have been discussing it with the Commission over some period of time.

Senator HICKENLOOPER. You are head of the nucleonics division of General Electric, are you not?

Mr. WINNE. That is true. But I have been away from that for some considerable time, and it may be——

Senator HICKENLOOPER. You have been here for 4 days.

Mr. WINNE. Yes. It has been under consideration. We have met with the General Advisory Committee and the final decision, so far as I know, has not yet been given to us, although it may have been given through the Schenectady office to my people in my absence. I

have been here and in New York, and I have not inquired within a week.

Senator HICKENLOOPER. I assume you have not been out of communication with your office?

Mr. WINNE. No; not entirely.

Senator VANDENBERG. Mr. Chairman, may I ask one question?

The CHAIRMAN. Yes, Senator.

Senator VANDENBERG. I am still curious about this chain of command, Dr. Winne. Is General Electric entirely autonomous in its operation of Hanford?

Mr. WINNE. By no means.

Senator VANDENBERG. To what extent does the Atomic Energy Commission tie back into the responsibility?

Mr. WINNE. Well, our contract, Senator Vandenberg, provides that our whole program, in fact our whole operations, are subject to the Commission's direction. I forget exactly how it is worded, but it means essentially that.

Our program and our operations must be reviewed by them; programs must be approved by them, and that sort of thing, so that the whole policy of operation and the objectives are laid down by the Commission. We do the job of carrying out these various policies and projects.

Senator VANDENBERG. Well, in practical effect, however, as I listen to these various episodes, is not the effect of the arrangement that you are substantially autonomous?

Mr. WINNE. We do not feel so, Senator, by any means.

Senator VANDENBERG. How often have you had a directive from the Atomic Energy Commission in connection with the operations at Hanford?

Mr. WINNE. I cannot answer that question. I do not know whether Mr. Prout can in those terms.

Mr. PROUT. Well, Senator—

Mr. WINNE. But they are in constant contact. Mr. Prout's office and Mr. Schlemmer's office are on the same floor in the same building at Hanford, and a lot of people of the two organizations are on the same floor.

There are constant discussions in our operations at Schenectady between the Commission's representatives, and our own; at Knolls Atomic Power Laboratory, they are in the same building; the offices of the Commission manager and the head of our laboratory there are adjacent, and we are in constant discussion almost regarding the programs and the carrying-out of the programs, and so forth, Senator.

Senator VANDENBERG. Go ahead.

The CHAIRMAN. I have a question here, Dr. Winne. On paragraph 1, page 2, I read the following:

A number of good men, having thrown their best energies into this job under the conviction that it is an important job, have seen it handled as though it were unimportant.

Mr. WINNE. I disagree with that statement of Dr. Wende's insofar as we are concerned, Senator McMahon. We considered it an important job and endeavored to handle it as an important job.

The CHAIRMAN. I would like to drop down to the paragraph beginning:

My own part of the organization—

starting there, and continuing:

I have told them that they are the hottest crew in the business; they believe this, as I do, and they have performed like champions.

Well, that is not consistent with the statement that they "have seen it handled as though it were unimportant."

I cannot reconcile those two statements, myself; can you?

Mr. WINNE. No; I cannot, Senator. As I say, I do not agree with that first statement: that it has been handled as though it were unimportant.

Senator HICKENLOOPER. I think it would be well to read the next sentence in connection with that.

The CHAIRMAN (continuing).

But I do not propose to stand by while such a crew is continually swamped by jobs which could be diverted elsewhere or delayed by a little astute "horse trading," or to ask them to continue to operate on a shoestring when every principle of sound management demands that they be given hawsers.

Do you know what he means by that?

Mr. WINNE. My inference is that he is again referring to the continued high pressure under which he felt he had to work, as discussed in his conversations with Mr. Prout and myself and that he apparently feels it is possible we might have put pressure on the Commission to endeavor to get some of the technical jobs we were doing there done elsewhere. That is the only interpretation I can put on it.

The CHAIRMAN. Do you feel as though you have loaded them on there, or the General Electric Co. has loaded that end of the business with more than you should have loaded them, where you could have done it elsewhere?

Mr. WINNE. I do not feel so. We have the facilities, the facilities there, with which to do some of the experimental work, which were not available elsewhere.

He speaks also of the working conditions, and so forth.

We have had under discussion with the Commission for some little time the advisability or discussing the advisability of providing better laboratories and better technical facilities for our technical people there.

At present, as in so many of the Commission's facilities which were built by the Manhattan District during the war, the construction for some of them is of a more or less temporary nature, and, of course, not at all comparable to the General Electric's research laboratory, at Schenectady let us say, and so we are in the course of discussing right now the advisability of providing what we term a "technical center" there at Hanford in which these men would have somewhat better working conditions and better facilities than they have now. We are cognizant of these questions.

Senator HICKENLOOPER. Have you discussed those things with the Commission generally over the past 2½ years, since the Commission obtained control?

Mr. WINNE. I cannot tell you how long this has been under discussion. I think this technical center has not been under discussion that long. It has been under discussion for some time. It is an expensive matter, and, of course, it ties—

Senator HICKENLOOPER. Did you consider it to be an essential matter out there?

Mr. WINNE. We consider it very desirable, and it may prove to be quite essential, but, Senator, in the past year or so it has not been so essential in the estimation of the Commission and in our own estimation, as the design and construction of these additional very essential production facilities, in order to be sure of maintaining the desired production of material for weapons.

Now, those are getting behind us to a considerable extent, and we can begin to think of these other things.

The CHAIRMAN. I am through.

Now, are there any other questions in respect to Dr. Wende's resignation?

What comment do we have on this letter from this captain of the guards?

Mr. PROUT. He is not a captain of the guards, Senator. He is a guard, and president of the guards' union, that guards' union.

The CHAIRMAN. That makes him, de facto. [Laughter.]

Mr. PROUT. That guards' union is in the process of organization. It has petitioned the NLRB to call for an election. We have, in discussing the matter with the NLRB, indicated that we would not agree to a consent election. We think the matter of the guards being unionized is one that needs to have a good deal of discussion and consideration. Whether that situation had any influence on the letter this man wrote, or not, of course we do not know; but I thought it would be pertinent to bring out the fact that this union is not a bargaining unit which has been certified to us by the NLRB.

With regard to his allegation of reducing our guard force and thereby not having adequacy of guards, we did have a reduction in guard force, but none of the main patrol points for the checking of personnel was affected by the reduction in the patrol force at the Hanford Works because of this reduction. The force was not reduced at the barricades; it was not reduced at the badge houses or the exclusion areas, but some outlying posts were eliminated in the interest of operating more economically and more efficiently, and this change was made with the approval of the Atomic Energy Commission security personnel, and I might add that AEC security is continually checking to see that our forces and our procedures are adequate for the purpose for which they are intended.

The actual security was strengthened at the control points through the doubling of patrol forces at shift-change time, permitting the efficient handling of added responsibilities with emphasis on these pat searches and barricade spot searches of personnel entering or departing.

I think it is worth pointing out that the material that was taken in this case was natural uranium and not U-235.

I think it is worth pointing out that this was a check conducted by AEC security to see what could be done, and I think perhaps Mr. Schlemmer or some AEC representative might wish to elaborate a little on that.

With regard to security, the most important factor upon which it is based is the clearance check, the character and the loyalty of the people involved, and in this area men can carry out in their heads information that would be much more valuable to the enemy than that which they could carry out on their person.

Now, in Mr. Smith's letter he said that Assistant Chief Pillsbury had helped him to prepare the letter. The matter has been checked into, and Assistant Chief Pillsbury said that he did not advise—he did not help the man write the letter but advised him that it should not be sent because he was disclosing certain security information, what degree to which we go to in searching people, things of that kind, which are things really bordering on secret information. Even we do not talk with others about what we do to make sure that we are carrying the security matters to an adequate degree.

I think that is all I have to say, unless there are some questions or unless Mr. Schlemmer wishes to refer further to this matter of the removal of two slugs from a certain portion of the Hanford Works.

Mr. SCHLEMMER. It is also true, Mr. Chairman, that Mr. Smith, a security patrolman, was not assigned in the area in which this particular check was made. He is incorrect with respect to his statement that F. C. Schlemmer is in direct charge of security. I, of course, have the general total responsibility. The specific responsibility is in the hands of a member of the Manager's staff, who is the AEC security officer.

Senator HICKENLOOPER. The man employed, is in charge of that security office; is he not?

Mr. SCHLEMMER. That is correct. The particular test which is referred to in Mr. Smith's letter, was one of many, many tests and checks which have been made throughout the total program. It was made on the 23d of August of 1948, and was made by an AEC security officer. Two uranium slugs were removed from a certain area, after the person who had removed them had been assigned to perform that specific effort.

Senator HICKENLOOPER. By whom?

Mr. SCHLEMMER. By the security officer at Hanford after consultation, prior consultation; with the Director of Security of the Atomic Energy Commission in Washington.

The slugs remained on the premises, were in control of the security office from the time they were removed from the particular point of their removal until the time they were returned thereto.

The CHAIRMAN. Do those fellows wear uniforms?

Mr. SCHLEMMER. They do not.

The CHAIRMAN. Those security officers?

Mr. SCHLEMMER. They do not.

The CHAIRMAN. Well, they are well known to the operatives in the plant?

Mr. SCHLEMMER. They are well known to the operatives in the plant.

The CHAIRMAN. In other words, when this fellow went into the secured area and took those slugs, he was not particularly watched because he was known to be of the security force, is that it?

Mr. SCHLEMMER. Well, that is not only true, Mr. Chairman, but it is also true that no one has access to those areas except on proper production of credentials. Ordinary persons cannot get within any reasonable distance of that area.

The CHAIRMAN. The point is that it is easy enough to understand how he got in there, how he took the two slugs and how he left. That has never concerned me in the slightest, any more than if a police lieutenant took his fountain pen off the desk of a patrolman and walked

away with it, and vice versa. He is expected to be there; he is in uniform; he is known; he is identified.

But the point is: Why did such a long time go by before the people in the plant knew that the two slugs were gone?

Mr. SCHLEMMER. Well, the purpose of this particular check was to assure that the actual accountability procedures were as effective as they could be and the desire was that these two slugs which represent an infinitesimal portion of the total amount of this raw material would show up in the so-called accountability records.

Now, throughout the entire program, both prior to this and subsequent to this incident, continuing checks, continuing efforts, continuing discussions and requests have been in effect with respect to the tightening up of security controls. The records are very clear with respect to all of these efforts.

The CHAIRMAN. When did the people who are in charge of the place where the slugs were taken from—when did they first indicate to you that they had got wise to the fact that the slugs had been taken out?

Mr. SCHLEMMER. Well, it happened that this particular incident occurred prior to my coming to Hanford. The individual in charge of the project at that particular time was aware of this test; that person was the acting manager, and he was informed regarding it very promptly.

The CHAIRMAN. But the men inside who actually had charge of the slugs, when did they wake up that they were gone?

Mr. SCHLEMMER. Well, they were advised a number of months later, Mr. Chairman, with respect to this.

Mr. PROUT. Mr. Chairman, it was a number of months before the discovery was made by the people responsible for accountability that one slug was gone. They never did report the other one missing. One of the slugs was before it had been through the process, and in the area in which that work is done it must be regarded as similar to a machine shop machining steel, and there is a large amount of this stuff being machined, and—

The CHAIRMAN. That is before processing?

Mr. PROUT. Yes, sir; before processing; and those responsible for accountability did not have a system that would show up the loss of a piece of this material of the relatively small proportion of the total being handled.

The CHAIRMAN. As a result of this experiment, have you corrected that situation?

Mr. PROUT. We have, and consideration was given and is being continually given as to how to improve in this particular matter. Accountability up until this time had been carried on primarily by lot shipments, and accountability by weight of material, because there were so many pieces involved, and, of course, this is the raw material, and accountability has been consistently accounting for all of the material received to within less than a half of 1 percent, so that the portion of the material that is difficult to account for is lost in machining operations; some of it goes into dust, which goes into the ventilating system and goes through the filters; some of that material is dissolved in the processing and is lost in the solutions. Some of it goes into chips which are subsequently washed, and, therefore, the dust is washed from them and goes down the drain. The balance, of course, is weighed and recast into ingots for further use.

It was felt up until that time that accountability for the raw material to within that very small percentage was adequate. It was not considered really feasible, or would not be considered desirable for anyone to remove a piece of the raw material because that would disclose nothing to anyone. As I said previously, a slug after processing would reveal perhaps some secret information, but the guys who do it can reveal a heck of a lot more by what they have in their heads than they can by taking a piece of material out.

Now, we are hard at work trying to develop—we think we have the answer so that no one, no matter who he might be, will be able to carry a piece of this stuff out in his pocket or a dinner pail.

Mr. HOLIFIELD. I was just going to say that you still cannot give security to that area which you spoke of, which is in the man's mind, where he can take out a great deal more information than a small sample of the material.

Mr. PROUT. We have not found a way to do that yet.

Mr. HOLIFIELD. There is no way to do that. So, we might as well face the evident conclusion that it is absolutely impossible to perfect a foolproof system to maintain security as long as it is dependent upon a man's loyalty and patriotism.

Mr. PROUT. Yes, sir; and, of course, as you know, Congressman, on the security checks, at least our experience has been, a considerable amount of time is taken, and very close investigation is made to determine a man's character and his loyalty to the Nation, and that is the basis, the prime basis, it seems to me, for providing for security.

Mr. COLE. Mr. Chairman?

The CHAIRMAN. Yes, Mr. Cole?

Mr. COLE. May I inquire: The individual who removed those two slugs, was he one of the security officers, or was he one of the employees engaged in the operation?

Mr. SCHLEMMER. It was a member of the security staff of the Atomic Energy Commission acting under the direction of the chief of the security staff at Hanford whom I should like to identify as Mr. V. K. Schumann, who was formerly a security and an intelligence officer of the Manhattan Engineer District on the atomic program.

Mr. COLE. One other question: What comment do you have to Mr. Smith's observations that it was only recently that the guards had been shown the appearance of the thing that they have been searching people for, for months?

Mr. PROUT. It is common practice in this business to limit the area of activity of all personnel to just that portion of the work that they do, and it apparently was not felt necessary to show the guards precisely what this material looked like, although, while I have not checked that particular point, I am a little surprised that it was not done, because continual meetings are held in the instruction of guards.

Mr. COLE. You think, then, that Mr. Smith is in error?

Mr. PROUT. I am not saying that he is, but it could be that he is.

The CHAIRMAN. Are there any other questions on this matter?

Senator Hickenlooper, would you like to continue?

Senator HICKENLOOPER. I would like to get the record straight on a phase that was touched on just a few days ago.

Mr. Winne, I believe you stated that General Electric has this contract at a profit of \$1 per year, which means no profit at all, of course—a symbolic profit.

Mr. WINNE. That is right, sir.

Senator HICKENLOOPER. Is it not true that General Electric gets \$200,000 a month, an administrative overhead allowance?

I am not saying that is wrong or right. That is not the purpose, but I would like to have this record clarify that \$200,000-a-month "Administrative overhead" item, which amounts to \$2,400,000 a year.

Mr. WINNE. The error in your statement, Senator, is calling it a \$200,000 "Administrative overhead" item. We receive \$200,000 a month as a fund against which we may charge such administrative overhead as we actually spend and can demonstrate to the satisfaction of a firm of certified public accountants, satisfactory to the Government, and which has not been reimbursed either at the Hanford operations or at Schenectady.

After that accounting at the end of the contract, then if there is excess—and it seems quite apparent that there will be excess—the excess will be returned to the Government. That is, that is not a payment which we get and keep. It is a fund against which we may make such charges as we actually expend, and that is all.

Senator HICKENLOOPER. The operation at Hanford, all cash expenditures, and all salaries of full-time people and materials and things of that kind are reimbursable; are they not?

Mr. WINNE. But not all of them. Practically all of them, Senator; but, for example, Mr. Prout's salary as an officer of the company is not reimbursed at Hanford. We charge that against this administrative fund.

Senator HICKENLOOPER. That is what I am trying to get at. The impression may well be left that General Electric gets \$200,000 on top of all reimbursements.

Mr. WINNE. We do not, because, for example, a portion of my salary—a pretty good portion of my time is getting to be spent on this project, but it is not directly reimbursed. I endeavor to keep a daily record of approximately how many hours I spend, and every quarter that is added up, and a portion of my time is then charged and expenses against this administrative fund.

The same is true of our general accounting department at Schenectady and various other functions of the company.

Senator HICKENLOOPER. Is it fair to say that all full-time people who work at Hanford—that is, who spend all their time there—plus all materials and equipment and other expenses, are fully reimbursed, and then out of the \$200,000 a month the part-time services of General Electric's top management and Schenectady bookkeeping and things of that kind brought into this project or the Schenectady atomic project, a part of which should be charged to atomic energy and part of which should be charged to General Electric's private operations—the part that is devoted to atomic energy in the Schenectady operations and Hanford operations, and any other—that that part-time cost comes out of the \$200,000 fund?

Mr. WINNE. That is substantially true, Senator, although as I said, Mr. Prout being an officer of the company, his salary is paid from our headquarters at Schenectady and is charged against this administrative fund, although he is full time on the project at Hanford.

Of course, he is not full time at Hanford, but that is essentially it. He is full time on the Hanford project.

There are a few other expenditures which I classified under Government accounting as nonreimbursable, but which in our mind are justifiable at Hanford.

For example, we made a payment to the Hanford Community Chest. We do that in all of the cities in which the General Electric Co. operates. We felt it was a very reasonable thing to do there.

Senator HICKENLOOPER. Is that charged against the \$200,000?

Mr. WINNE. That is charged against the \$200,000 fund. That is one.

Senator HICKENLOOPER. The Government pays it one way or the other, whether the General Accounting Office allows the expenditure or not.

Mr. WINNE. That is true, and that is in accordance with the provision in the contract which insures that we shall be reimbursed for expenditures which we make on behalf of this contract and which a firm of certified public accountants feels we are justified in doing. We are getting no profit from that, and neither do we want a loss from it, and we are devoting a good deal of administrative and technical talent to it, which we could very well use in our commercial business.

Senator HICKENLOOPER. How often do you cast up an accounting on this \$200,000 a month?

Mr. WINNE. The accounting has not been worked out in detail as yet, Senator, except insofar as actual time of some of us who are putting a good deal of time against it is concerned. For example, our accounting department sends around to all of us who are putting time on this project every month a card on which we place our best estimate of the percentage of our time we put on it. We do not do that with anyone who puts less than 10 percent of his time on it. There are various expenditures of a corporate nature which we make for the over-all company which to some extent are because of this contract. Mr. Wilson, for example, spends more hours than you would think, I believe, in discussions on this contract with Dr. Suits and Dr. Jeffers and myself, and that sort of thing; and we have to arrive at some formula which is agreeable to a firm of certified public accountants for endeavoring to determine a just charge against this fund for such items. What that will be I do not yet know.

The accounting on this particular fund, as specified in the contract, shall take place at the termination of the contract. This contract terminates December 31, 1950, as I recall.

Senator HICKENLOOPER. So at that time the \$2,400,000 a year will be checked off against the actual overhead items that are supposed to go into it, and—

Mr. WINNE. The present indication is that a considerable portion of it will be returned to the Government. That is my judgment to date.

Senator HICKENLOOPER. That is all.

The CHAIRMAN. Dr. Winne, of course the General Electric naturally will secure a great advantage over anybody else in the electrical-manufacturing industry if and when this power becomes useful for peacetime pursuits.

I, however, would call attention to the provision of the act which provides that, if any device is invented by any private person or private industry for the use of this power, there is a provision for patent-

ing that to use, but there is also a provision in the act which would compel your company to license its use upon the basis of payment of royalties which would be either agreed upon or, in the event of failure to agree, to be set by a board to be appointed by the Commission, from which there would be appeal to the circuit court of appeals. That is correct; is it not?

Mr. WINNE. That is correct, Senator, and more than that, if I may take just a minute, there is a provision in our contract, with which we agree fully, that in the operation of the Knolls Atomic Power Laboratory, where such developments in the power line for the future, we hope, will take place, we shall be willing to employ a considerable number of competent scientists or technical people from other industries who may have interests in this field. During this past year we have had at least five men from the Westinghouse Co. working full time in the Knolls Atomic Power Laboratory in full contact with all the operations going on there, with the entire development, and I think there have been one or two other people brought in. But the contract provides for a number up to a maximum, I think it is, of about 15 percent of our own technical people that we will be willing to employ in the laboratory and give them access to the whole development which is going on there.

As I say, we have done it already for five at least of the Westinghouse people.

The CHAIRMAN. So the possible profit in the future would be the royalties that might be received by the company?

Mr. WINNE. No; I think not on royalties, Senator. I do not look for much profit from that. As I see it, our main reason for going into this project at all is that here is a development of atomic energy which has at least the possibility of being a factor in making electric power more readily available, available over greater areas and possibly at lower costs, for the future than it is now.

Any development of that nature is of interest in the General Electric Co., because we are an electrical-manufacturing company; and the more readily electric power is available to everybody, the more chance we have to sell our products.

The CHAIRMAN. You are really shooting for——

Mr. WINNE. For the long-term future.

The CHAIRMAN. For 2,000,000 times as much power——

Mr. WINNE. I do not know whether it is 2,000,000 times.

The CHAIRMAN. That is the figure I have seen in some of the reports—the possibility of development of two millions as much power from the same unit of matter.

Mr. WINNE. You mean from a given weight?

The CHAIRMAN. From a given weight.

Mr. WINNE. Two or three million times.

The CHAIRMAN. Two or three million times as much. So, those are the stakes you are really shooting for.

Senator HICKENLOOPER. Mr. Chairman, I would like to go down to Los Alamos, but I am not certain that the Los Alamos people are here. I feel that it is not necessary for them to be here, but I think the information on these matters is on file with the Commission.

I would be perfectly willing at this time to go over a number of items, to mention a number of items, and they can either be answered today or tomorrow, what I expect to bring up.

The CHAIRMAN. Mr. Wilson is signalling me.

Mr. WILSON. Mr. Chairman, General McCormack, Director of the Division of Military Application, and Mr. Tyler, the manager of Los Alamos, are here.

The CHAIRMAN. Are they the direct culprits?

Mr. WILSON. Yes.

Mr. VOLPE. Mr. Chairman, before we leave this patent provision of the General Electric Co. contract, I would like to point out that under the General Electric Co. contract with the Atomic Energy Commission they acquire no patent rights. All patent rights vest in the Government.

The CHAIRMAN. Vested in the Commission?

Mr. VOLPE. That is right.

Mr. WINNE. I should have brought that out.

The CHAIRMAN. I think that is a most important point to bring out. I am glad you brought it to our attention, Mr. Volpe, because that makes the contract much more advantageous to the Commission and to the Government than if any future patents were to vest in the General Electric Co.

Mr. PROUT. All invention is handled in a regular procedure where we submit any invention to the Atomic Energy Commission for review, and if they see fit to apply for patents they do so.

Senator HICKENLOOPER. I think that is covered in the law, that provision.

Mr. PROUT. Yes.

Senator HICKENLOOPER. You are following the act.

Mr. PROUT. We do not get any of the patents on any of the inventions that come out of this work.

Mr. WINNE. Unless the Commission feels that it is not connected with the——

The CHAIRMAN. There is the possible exemption there, but I am glad——

Mr. WINNE. The Commission has a right to all of it; that is correct.

The CHAIRMAN. And they have exercised the right, and that is completely covered into the property of the Commission?

Mr. WINNE. We make reports, both from Hanford and from Schenectady, either monthly or quarterly, I forget which it is, to the Commission of all ideas which we think may be new and patentable.

It is within their power to determine whether they shall have title to the patents or whether we shall. Of course, anything which is important to the whole atomic energy program, the Commission naturally retains title.

The CHAIRMAN. Thank you very much.

All right.

Mr. WINNE. Senator McMahon, are we, from Schenectady and Hanford, more or less recessed for the time being?

The CHAIRMAN. Why did you put in the "more or less"?

Senator HICKENLOOPER. I suggested that I think at a later date we should discuss the general policy and progress on industrial development at Hanford, which I assume probably could be taken up at a later time and let these gentlemen go back for a breathing spell.

Mr. PROUT. That will be sometime in the future, not within the next day or two?

Senator HICKENLOOPER. That is right.

Mr. WINNE. May I express our appreciation for the very fair and courteous and objective treatment which you and your committee have accorded to us, Senator McMahon.

The CHAIRMAN. Thank you, sir.

**STATEMENT OF CARROLL L. TYLER, MANAGER, SANTA FE OPERATIONS OFFICE, LOS ALAMOS, ACCOMPANIED BY BRIG. GEN. JAMES McCORMACK, JR., DIRECTOR, DIVISION OF MILITARY APPLICATION; JOHN W. MACY, DIRECTOR OF PERSONNEL AND ORGANIZATION, SANTA FE OPERATIONS OFFICE, LOS ALAMOS; CARROLL L. WILSON, GENERAL MANAGER, AND JOSEPH VOLPE, JR., GENERAL COUNSEL, ALL OF THE UNITED STATES ATOMIC ENERGY COMMISSION**

Senator HICKENLOOPER. Mr. Wilson, you are General Manager of the Commission?

Mr. WILSON. I am, sir.

Senator HICKENLOOPER. And will you describe in whatever way you care to the functions of the Los Alamos installation?

Mr. WILSON. I would like, if I may, Senator, to begin with the Division of Military Application of the Commission.

Senator HICKENLOOPER. Tell us what Los Alamos does.

Mr. WILSON. At Los Alamos there is the laboratory, responsible for research, development, and tests of atomic weapons.

At Sandia, near Albuquerque, also under the responsibility of the Los Alamos office, is the engineering development laboratory associated with weapons.

Senator HICKENLOOPER. And Los Alamos then, I take it, is one of the most vital functions in the atomic energy program.

Mr. WILSON. It represents the most vital function, Senator.

Senator HICKENLOOPER. Who is the Director of that laboratory?

Mr. WILSON. Dr. Norris E. Bradbury.

Senator HICKENLOOPER. What would you say about his responsibilities in the atomic energy program?

Mr. WILSON. They are very great. As Director of that laboratory, he is the scientific leader and administrative head of the Los Alamos Laboratory, has a major part in its program, in the development of staff, in the selection of scientific staff, in the guidance of that program, evaluation of results, and so on.

Senator HICKENLOOPER. And in the production of weapons?

Mr. WILSON. Yes. There is a responsibility in connection with the production of weapons, but the laboratory itself is more in an advisory and pilot-line role in relation to the production of weapons than as a production center.

Senator HICKENLOOPER. I understand that, but let's put it this way: In the design and production of weapons, that is pretty much of a spearhead, is it not?

Mr. WILSON. In the design and development of weapons it is.

Senator HICKENLOOPER. And Dr. Bradbury is the keyman in that position?

Mr. WILSON. He is the Director of the laboratory.

Senator HICKENLOOPER. Dr. Bradbury is a very great atomic scientist?

Mr. WILSON. Yes, sir.

Senator HICKENLOOPER. Probably one of the most outstanding atomic scientists in the world?

Mr. WILSON. We believe he is an excellent head of that laboratory and an outstanding atomic or nuclear scientist.

Senator HICKENLOOPER. In the responsibility for this program would you say his responsibility is either top or that none exceeds him in responsibility in this program in the production end of weapon development?

Mr. WILSON. Not in the production end, Senator.

Senator HICKENLOOPER. I mean design and production.

Mr. WILSON. In the design and development end in connection with the development part of tests, clearly he has a key role.

Senator HICKENLOOPER. He is the top in that?

Mr. WILSON. That is right.

Senator HICKENLOOPER. What is his salary?

Mr. WILSON. \$14,000 a year.

Senator HICKENLOOPER. Then Dr. Bradbury, one of the top atomic scientists in the world, who occupies the top, key position in weapons production, gets almost a third of what Mr. Creedon gets at Hanford for building some houses and schoolhouses and some other production facilities that start out at \$6,000,000 and end up at \$25,000,000.

How do you justify such a comparison and such an authorization of salaries in the Commission?

Mr. WILSON. As to Dr. Bradbury's salary, this is comparable with the salaries of the Directors of the other laboratories which the Commission owns and are operated by the contractors such as the Argonne Laboratory, the Oak Ridge Laboratory, the Brookhaven Laboratory, the radiation laboratory at Berkeley, and so on.

The general scale of salaries for staff within the Los Alamos Laboratory compares favorably with leading industrial research laboratories. A recent review and examination of the laboratories' organization and salary structure was made by Dr. Kelly, executive vice president of the Bell Telephone Laboratories, and he so reported to us.

I think it is fair to say that the salary of Dr. Bradbury, as the head of the laboratory, is less than would be customary in industrial research positions. It is comparable with good top salaries in the leading academic organizations and institutions of the country.

My point is that the salary structure at Los Alamos, including the salary of the director, is comparable with our other laboratories. It is important and we have endeavored to bring about a reasonable degree of comparability for comparable levels of scientific ability within these several laboratories.

This is essential, lest we initiate a spiral of increases of salaries among these people or set up such differentials that there come about important shifts of people from one laboratory to another.

So, as to Mr. Creedon's salary, I believe Mr. Winne yesterday explained the reasons for the General Electric Co. selecting Mr. Creedon for that post and the conditions which they agreed to and were required to agree to in order to get his services.

The Commission approved this as being the best arrangement which the General Electric Co. could make.

Senator KNOWLAND. Might I ask a question?

The CHAIRMAN. Surely.

Senator KNOWLAND. Mr. Wilson, could you estimate the number of people who are on the pay rolls of your contractors having salaries that approximate Mr. Creedon's or run in the ratio, we will say, from \$14,000 for your top laboratory man up to the point where Mr. Creedon is being paid by the General Electric?

Mr. WILSON. Mr. Creedon's salary is in excess of any others which the Commission reimburses to any of its contractors. There are a few people who were among those furnished by the duPont Co. to General Electric in connection with the construction program at Hanford who receive salaries of 16 to 20 or 22 thousands dollars a year. I believe \$22,000 was the maximum.

Senator KNOWLAND. Could you furnish to the committee a list of all such?

Mr. WILSON. We can, sir, and we will.

(The data referred to above are marked "Exhibit 19" and will be found in the appendix.)

Mr. WILSON. Mr. Tyler says that he recently recommended an increase for Dr. Bradbury, which Dr. Bradbury declined.

Mr. TYLER. No. May I amplify on that?

As you realize, Dr. Bradbury's salary is paid by the University of California, which is his employer and is the contractor for us. I recommended an increase for Dr. Bradbury to the president of the University of California, which was not granted at the time, but which he said would be taken up this month when the regular academic salaries are under discussion by the board of regents.

Senator HICKENLOOPER. Mr. Chairman, Los Alamos is a peculiar and very vital functioning unit in the atomic energy set-up. It has problems that I think are not common with any other unit in the program, and there are certain facts that, while interesting, will not lend themselves to a public discussion. Generally speaking, it is a scientific laboratory and it does, as Mr. Wilson has said, assume the responsibility for the design and production of weapon types and things of that sort.

So that it is primarily a scientific laboratory with certain practical aspects that I shan't go into the matter of production or design, which is a scientific thing and which I believe is going forward satisfactorily at Los Alamos. I think it is under the most highly capable management in Dr. Bradbury, and I can say from my own opinion that I think the Commission and the Nation is fortunate in having the services of Dr. Bradbury as the director of that laboratory.

Dr. Bradbury, however, has nothing to do with the ordinary operating policies of the collateral aspects of Los Alamos. He runs the laboratory and he runs the experiments and design development. There are a number of things at Los Alamos that I think are important that I would like to go into or at least start into in the few minutes we have left.

For instance, in the expenditure of money at Los Alamos I have a feeling—and I believe the facts verify it—that money is being spent at Los Alamos with an abandon that is really startling.

For instance, I would like to call your attention, Mr. Wilson, to one item, the addition to Fuller Lodge at Los Alamos in which \$329,220 was spent to add, I believe, 28 additional sleeping rooms to a log lodge at Los Alamos.

This lodge was originally built by the former owner, and while I think perhaps some additional sleeping rooms might be indicated at Los Alamos, yet I feel that the addition of a very beautiful steel-reinforced concrete with a cut-stone facing addition to Fuller Lodge at a cost of somewhere around \$12,000 per room is an extravagance that needs some explanation. The total is \$329,220 in this item, exclusive of land, I understand, and it added 28 additional sleeping quarters.

There may be an additional dining room or some other facilities added, but the net result was to provide 28 additional sleeping rooms to the lodge. I submit that something in the neighborhood of \$12,000 per room is a matter that should be of interest in that one item.

Mr. WILSON. Senator, I would like to ask Mr. Tyler to give you the details on that. Mr. Tyler is the Manager for the Commission at Los Alamos.

Mr. TYLER. Your statement, Senator, naturally, is, in general, correct. The effect comes out a little differently.

The lodge is the oldest building and the center of the old school which used to be there. It is a log structure and is part of the original set-up. It contained 11 rooms.

In the previous administration the plan was made for improving the shopping facilities, et cetera, at the town. In the process they overran another rooming house which we had there. It was also part of the school, which contained some 28 beds, I believe, and about 23 rooms.

That had to be torn down to make room for the shopping center. It was advisable to tear it down in any case. I looked at it myself with the idea of possibly moving it, and it was impractical to move it. It was a fire trap; it had been added to with slabs and wood, et cetera; so it was very inadvisable to try to do anything with it.

We required additional transient rooms. These are not rooms occupied by the residents at Los Alamos. It is the only hotel we have in the community, and it is occupied by transient people who come there for a day or two to visit, inspect, consult, and so forth.

The addition of the 28 rooms, I feel, was done reasonably economically. The original plan, when I arrived there, was to tear the complete lodge down and to put a nice modern cement hotel across the end of the community center. I did not even estimate the cost of that. It appeared to me to be impractical.

Frankly, there was another point of view, which does not have too much sense, but every one of the old-time scientists there and many of the people formerly connected with the project hoped sincerely that the lodge would not disappear. It was the center of activity during the origin of the bomb; it was a place which had a great deal of memory attached to it, and it was a satisfactory hotel. So I determined instead to put additional wings on the lodge.

Further, the 28 rooms you mentioned are in two wings. We provided adequate office space for the manager and added a lobby, which did not exist previously. We also added and were required to add

kitchen facilities and storage facilities, which required a third wing; and in the interests of economical operation of the whole project and to get the thing straightened out, we added in the third wing, I believe eight rooms, which are used by the service people; the servants, maids, and so forth. They are small double rooms.

So we got, in addition to the 28 rooms, a modern, adequate kitchen with modern food-preparation facilities, and with space for the service personnel who had formerly lived over in one of the dormitories and who traveled back and forth.

The total cost per square foot, including the addition of the furniture and the addition of the kitchen equipment, the addition of the ice boxes, and all the equipping of this thing, including rugs and curtains and everything that goes to make a hotel, came to a total of \$21.41 per square foot.

I think that is well within reason on hotel construction. I do not mean to compare it with the Shamrock Hotel or something of that nature, but I think as far as hotels are concerned, \$21.41 per square foot is reasonable.

The CHAIRMAN. I hope you did not have an opening compared with it.

Mr. TYLER. No, sir; we could not afford it. I would be glad to answer any other questions you have on it, sir.

Senator HICKENLOOPER. Well, this addition to Fuller Lodge—it is correct, is it not, that it is a steel concrete-reinforced building added to a log building, and that it has a cut-stone facing?

Mr. TYLER. The construction is reinforced concrete; yes, sir; reinforced concrete because log construction comparable to what was in the main building would have been completely out of the price range. We could not afford to add log wings to this.

It is a normal concrete structure, which is customary, I believe, in most any organization which is building a rooming house, to make it as completely fireproof or fire-resistant as possible.

We consulted with our safety people and we had to put a safety wall between the existing log structure and the two wings before the safety people would permit the construction.

Senator HICKENLOOPER. And it has a cut-stone facing?

Mr. TYLER. The lower part is of native stone, the facing, which you can cut with a saw. It is soft stone. It is to match in with the chimneys and the rest of the lodge.

Senator HICKENLOOPER. What is the rate for a room at the lodge?

Mr. TYLER. We raised the rates on the 1st of January, when we opened the new wings, and they run from \$2.50 to \$4.50 per bed. All of our rooms are equipped with twin beds, and since most of our visitors arrive without families we normally have to double up. People go two to a room. They each pay, varying with the type of room—in the modern rooms in the new wing, from \$3 to \$4.50 per person.

May I add to that—and I think it will come out in the long run, anyway: The lodge was a very inefficient operation. It was run under the contractor, but he was not allowed to change the employees. The Commission or the previous management had set the employees and said, "You will hire so-and-so, and you will not fire them. You just run the business." We lost considerable money on the lodge operation, and it was a difficult thing to arbitrarily change.

Many people had lived in the lodge for 2 and 3 years. We had some 60 people who were eating in the lodge for \$60 a month. They had been promised that when they came there 3 years before, and they were going to be difficult to uproot. It was going to be definitely a morale problem to handle, and, therefore, we waited until the wings were completed. The wings were somewhat late being finished.

When the wings were completed we established new rates for the rooms, new rates for the food, we stopped the monthly procedures. A man eating three meals a day would pay something around \$110 a month. The regular boarders have gone elsewhere.

As of last month the rooms returned a profit to the Government of \$600. The eating facility is still losing money, but over all the lodge only lost \$600 last month, and I predict, with perfect freedom, that within 2 or 3 months the lodge will not cost the Government any money at all. It will be a self-supporting operation.

Senator HICKENLOOPER. When you say the lodge returned \$600, does that mean \$600 more intake than outgo?

Mr. TYLER. Yes, sir, including all expenses and including their own utilities, for which they are charged. They pay their full way. That does not include any amortization of the investment.

Senator HICKENLOOPER. I was going to ask if that included anything on the \$329,000.

Mr. TYLER. That does not, sir, and that is a philosophy which may be open to criticism, but which I must maintain in that town as a whole: The Government cannot expect to amortize its investment in the living facilities which it provides for the people there. They have a right, and very properly a right, to get a return which will cover the complete operation of the town and its utilities and its facilities and its schools, but not to attempt to adjust rents and scales, and so forth, there to get a return on a very expensive investment and construction. I do not mean that we will not take one if we get it. We start there with a mesa, we have to clear land, put in roads, utilities, et cetera. I think if the Government gets its operating expenses back each year to completely operate the town—and we are coming toward that very rapidly, although there is considerable difficulty, I do not feel myself—and I am a member of the Government and I am also a taxpayer—that we have any right logically to try to amortize the cost of that town. It was not built for anything except to provide a service to the laboratory.

Senator HICKENLOOPER. Who built the lodge?

Mr. TYLER. The original lodge or the wings?

Senator HICKENLOOPER. The wings?

Mr. TYLER. The wings were built by Robert E. McKee.

In order to save another question, the lodge was built by Robert E. McKee on a lump-sum bid. All our construction up there now is done by lump-sum bidding. We have no negotiated construction contracts. We have no cost-fixed construction contracts. Every bit of construction we do there and have done since I have been there has been put out for public bid, and we are getting more bidders all the time.

Senator HICKENLOOPER. McKee Construction Co. is the construction company that built Los Alamos, is it not?

Mr. TYLER. To a large extent; yes, sir. They built practically all of it. There was another construction company in there in the very early days, but they pulled out shortly after to go to the Pacific coast, and McKee probably built 90 percent of what is there.

The CHAIRMAN. Where is he from?

Mr. TYLER. He is from El Paso, Tex.

The CHAIRMAN. How many bidders did you have on these wings?

Mr. TYLER. I do not think I have the number. I doubt if there were more than one or two, because at that time we were only getting one or two bidders.

The CHAIRMAN. One or two? It makes a lot of difference.

Mr. TYLER. I do not know, sir. I do not have the figures right here.

Senator HICKENLOOPER. It is fair to say, is it not—

Mr. TYLER. There were not 10. It was a small number.

The CHAIRMAN. The important thing is whether there were two.

Mr. TYLER. I am reasonably certain there were, but I would not swear to it. I probably have opened 200 different bids out there.

The CHAIRMAN. Is it not strange that you would not have more than one bid for the construction of a common, ordinary hotel of this kind?

Mr. TYLER. May I amplify on that?

The CHAIRMAN. Yes.

Mr. TYLER. It does look unreasonable. When I first came up there, McKee was in there definitely. He had been there for pretty close to 3 years. He had done just about all the construction that was done up there, and he had done it on negotiated cost-plus-fixed-fee contracts.

He had a number of his people living in Los Alamos, a great many of his workmen were living in Los Alamos. Many of his supervisors lived there. His equipment was there, and he was in a position to outbid anybody who came along on a building project.

The CHAIRMAN. Was this bid advertised?

Mr. TYLER. We advertised nationally in the contractors' magazines, et cetera. However, at that time—that was early in my career up there—it was difficult for anybody else to bid against McKee. He had everything up there. He had his people living there. He did not have to worry about housing, et cetera.

I came in July of 1947, and in September 1947, McKee was ordered to move his people from the project. I felt I had to do that in order to get fair competition. I could not offer the others housing; therefore, he could not get a fair bid. It took him 3 months to do it, but by the 1st of January all of McKee's employees were living privately outside the project.

That gave an opportunity for somebody else to come in and bid fairly. But it was some time before we began to get bidders. This thing had become pretty much of a closed proposition to most of the contractors, and there are no contractors in that part of the country. We have to go to Texas or up to Denver to get contractors.

The CHAIRMAN. Nobody in Albuquerque?

Mr. TYLER. No major contractors in Albuquerque. We have some small contractors at Albuquerque, but they are small.

The CHAIRMAN. No contractors in the whole State of New Mexico?

Mr. TYLER. Not a major contractor.

The CHAIRMAN. No contractors equipped to do a \$329,000 job?

Mr. TYLER. They probably could have done that job, but could not have underbid McKee.

The CHAIRMAN. They did not bid on it?

Mr. TYLER. I think not. Here is a note that the average number of bids we received on our open bidding in 1947 was two. That was our average in 1947.

From January to November 1948 we got an average of 4.3 on all our bidding. The last 6 months we have had an average of 8.

In other words, we are improving the situation and we are getting more bids all the time.

Mr. HOLIFIELD. Mr. Chairman, having visited the Los Alamos project several times and being somewhat familiar with it, I think that this observation is pertinent.

Los Alamos is a small community located on a mesa some 40 miles from the nearest large town—and I say “large” rather loosely, because Albuquerque in terms of national cities is not a large town, and the State of New Mexico, I believe, has very few more citizens in it than my congressional district.

So the thing you have to keep in mind is that this is a very isolated community. Also that the problem of transportation from the nearest railroad is by truck up tortuous mountain grades. It is true that this original company, due to the fact that it was in on the ground floor during the wartime construction, had in a natural way obtained a very favorable and advantageous position.

During the time of the war, when the construction contracts were let, this company was in a position to do the building, they accumulated great quantities of equipment, and also personnel in the immediate vicinity, and they were in a very advantageous position to bid and to underbid anyone from without that had to bring their equipment in and establish the contacts and develop the personnel necessary to do the job.

This was a thing that existed under the Manhattan project during the days of the war. It developed during that time. As the record shows, it has subsequently been gradually changed. But the gradualness of the change, I believe, is understandable, due to the isolated areas involved and the lack of other large contractors that were willing to come in there and compete with the McKee organization.

I am glad to see that you are getting more bidders in there at the present time.

The CHAIRMAN. They have had it pretty creamy.

Mr. HOLIFIELD. Yes.

Mr. TYLER. They definitely had an advantage, yes, sir. However, I must say in full fairness that the company did an excellent job. I think they deserve considerable credit for the time in which they constructed some of the technical facilities up there. One of the major facilities that the laboratory said they had to have in 9 months, they needed it in 6 months, it was constructed in 4 months, and nobody imagined it could be done.

I hold no special brief for that particular company, but I would like to give them full credit for having done an excellent job. They are still bidders up there and they are still competitive bidders up there. They are not getting much over one-fifth of the work, but they are still there and still fighting for their business.

Senator HICKENLOOPER. Mr. Chairman, I would like to now suggest that the Boy Scout lodge was built at Los Alamos at a cost of approximately \$50,000 and paid for by the Government.

Mr. TYLER. Yes, sir, there was a lodge built there. It is not a Boy Scout lodge. It is a youth lodge. It was misnamed in its design stage and has never been wholly used by the Boy Scouts.

Senator HICKENLOOPER. Is it not correct to say that it was named in its design and proposal stage as a Boy Scout lodge and later objection was made to the extravagance involved in this building and it became a youth lodge and some other things after that?

Mr. TYLER. No, sir, that is not quite it. The name was changed from Boy Scout lodge to youth lodge, but it was changed before the thing was built. It was changed because the intent, the use of it was changed.

The lodge is now used by all the youth organizations. It is used by the Boy Scouts, the Girl Scouts, Rainbow Girls, the DeMolay people, and it is used further by the schools for various exhibitions which they want to hold and not tie the schools up for a number of days. They have Indian art exhibitions, for instance. The lodge is used at least 6 nights a week by some activity, and it is not exclusively used by the Boy Scouts. They have nothing in there that nobody else has.

Senator HICKENLOOPER. Are there not other community facilities in Los Alamos?

Mr. TYLER. Not of that type.

Senator HICKENLOOPER. What are the other community facilities there?

Mr. TYLER. You mean of a type that could be compared to—

Senator HICKENLOOPER. The type of facility where people can gather and hold meetings.

Mr. TYLER. We have what we call the community center recreation hall, which has a dance floor. That has a curtain which will divide it in two parts, and in there we hold the town forum, high-school graduation exercises, and things of that nature; and probably one organization or another will hold about three dances a week there.

We have what used to be an old movie theater which was built by the Army, a barn-type structure, which will seat around 800 and which we use as our only basketball court. We use it for basketball games, big dances, the community concert association fills it in the concert season.

Those are the only two facilities of that nature we have besides the youth lodge.

Senator HICKENLOOPER. I have been in this youth lodge or Boy Scout lodge and it is a very fancy building. It is another stone-faced building, as I recall.

Mr. TYLER. No, sir. I would be very glad—

Senator HICKENLOOPER. I skinned a knuckle on some stone on it.

Mr. TYLER. There is no stone in it other than the fireplace. It has a fireplace. The lodge was built in an experimental set-up. We tried to build it with stucco and found it could be built of logs more cheaply. It is built of prefabricated logs. Some people in the Pecos Valley about 40 miles away set up a system of running logs through a trick mill and they come out the same size and same shape and you put the logs on like a kid's blockhouse.

We did it more cheaply than stucco. The man has since gone broke. He could not afford to make logs like that. There is in the lodge only a kitchen, with iceboxes and food-preparation facilities, a servant's room, and the rest is bare floor.

Senator HICKENLOOPER. I am not an expert on building, I do not claim to be. I have been in the building that is referred to and, having been interested from time to time in the past in building costs for other structures on occasion, it is my impression, although I may be wrong, that a perfectly adequate building of this kind could have been built for much less, if such a building was indicated as being needed in the general scheme of things there.

Mr. TYLER. Again, that went out on bids, sir. That is a lump-sum contract.

Senator HICKENLOOPER. It is rather an intriguingly put-together building with these machine-cut, notched logs, fitted accoutrements, and things of that kind. I submit that in most towns the Boy Scouts and other groups find ways and means of projects in which they create their own facilities.

I want to call to your attention to the amount of money that was spent in remodeling the so-called Kellogg-Manley House, which is somewhere in the neighborhood of \$48,000, I am told, which was the assistant manager's residence, or something of that kind.

Are you familiar with the details of that?

Mr. TYLER. I do not have the exact price of that remodeling, sir.

Senator HICKENLOOPER. I think they went at it twice, did they not?

Mr. TYLER. Not to my knowledge, no, sir. The Kellogg-Manley House, so-called—Dr. Manley, the Associate Director for Research of the Laboratory, and Dr. Kellogg, one of the division directors of the laboratory—Dr. Kellogg no longer lives there. It is a double house, one of the ranch houses, schoolhouses, when it was originally built.

This was done by me in the very early part of my stay there. I do not like to get into philosophy too much, but it is important in this case. I regret to have to say that the laboratory at that time, due to the change in the philosophy of the Government as to whether they wanted a military or civilian organization, and due to the delay in the civilian organization being able to take over, no decision had been made as to what the future of Los Alamos was to be.

Many of the scientists, as you all know, a great percentage of the scientists who were there during the original days of the bomb, the leaders, had of necessity gone back to their own pursuits. The others did not know what the future was going to be and whether there was any future. The program had not been determined upon by anybody.

The program was determined upon about the middle of 1947; the Commission got into action and was able to review the program and decided there was to be one.

As a result, the morale of the laboratory was at a very low ebb when I arrived there in July 1947.

Further, we had built some new housing up in the western area. The morale of the laboratory and the town was such that already that was beginning to be known as Snob Hill, and the people as a whole were dissatisfied and said, "All the good people are going up there and the rest of us can live over here on the other side of the tracks."

In the middle of town, adjacent to the lodge, are these five ranch-type houses, which had been occupied during the war by the senior scientists. I decided, and talked over with Dr. Bradbury and his staff, that unless they had reasonable objection I would like very much for them to stay down in that location and not move up in the western area and isolate themselves from the rest of the town.

Dr. Bradbury and his senior staff agreed with that philosophy and thought it was necessary that there not be two sides of the tracks.

He said, "We cannot live in those old-type ranch houses. They are falling to pieces. They will have to be fixed up."

I said, "Certainly," and assumed responsibility.

The time was important. Dr. Manley was away. Dr. Kellogg wanted to move out and get his house fixed up before school time.

We got a cost-plus-fixed-fee contract. We went to Albuquerque and worked among three or four of the leading builders there and had the one who was willing to do it come up and attack this thing, doing it as we went along.

It resulted in putting in new heating systems, et cetera. It was pretty antiquated. The contractor did not do a good job. When he pulled out, he went broke completely. They were two partners. One is back as a carpenter and the other is an accountant for another firm.

We could not recover from them and had to do additional work ourselves. It was expensive. I did not know it was going to be so expensive. I did not know anything about building when I went up there. I am learning a lot of it the hard way.

I still feel in principle it was well justified. The senior members of the laboratory are still living in the houses. They are not elaborate. They were brought up to date with a bathroom where they needed it, and things like that.

Senator HICKENLOOPER. The issue I raised was that it was approximately \$48,000 on this one structure. Certain of the houses had to be repaired, I realize that.

Now, I reviewed last fall, when I was out there, the difficulty of the collapse of a great number of houses in Los Alamos due to roof failures, to foundation or floor-slab failures, and buckling and the necessity of spending approximately, as my information has it, \$600,000 for repair work and for certain additional improvements in this large number of houses.

I went into it somewhat more thoroughly, and I have the report or did receive the report that approximately half of this, or about \$300,000, could be reflected in and charged to additions such as covers for automobiles—that is, roofs over automobiles on the houses—and certain additions, but that somewhere in the neighborhood of \$250,000 to \$300,000 had to be charged directly to structural failures and faulty construction in the project.

Now, if we credit \$300,000 or half of that approximate amount to additions, it still leaves a loss to the Government of somewhere in the neighborhood of \$300,000 as the result of structural failures and faulty house construction. These houses were constructed during the Manhattan District days, I am told.

I asked last fall of the Commission and otherwise—there are several letters on it—I asked that responsibility for this \$300,000 loss to the Government be fixed, see who was wrong. Up until now—that is, this date—that responsibility has not been fixed by the Commission, so far as I know.

The most recent communication that I know of was a letter from Mr. Lilienthal, as Chairman of the Commission, to Chairman McMahon, which still did not fix the responsibility, but said that the matter had finally been referred to some department or agency in the Attorney General's office, or someone of that kind.

Now, I am aware of the explanations that were given for the structural failures, but in connection with that I want to call attention to the fact that the architect, the supervising architect and general architect who had charge of those houses, I am informed, in their construction, has, at least until very recently—I cannot speak for the last few weeks—been continued on the job as a supervising architect or the organization has, and between January 1, 1947, and September 22, 1948, this same group or this same company or architect had received fees in a total of \$2,252,343.31.

The point that I have repeatedly raised is:

First, the fixing of the responsibility for these failures. That fixing of responsibility has never been had.

Secondly, the continuance, with the payment of very substantial amounts of money to them, the architectural group that had charge of this construction and was supposed to supervise in the public interest reliable construction and acceptable construction for the money paid by the Government for those structures.

I would appreciate any comment on that.

Mr. TYLER. I would like to call your attention again—and as you recognized, the contracts for these houses were let before I came to the project and before the Atomic Energy Commission really had taken over, except as an acting manager with the previous military personnel still there.

The houses were finished to a large extent before I arrived on the project. Most of them were occupied when I got there.

Mr. HOLIFIELD. What was that date, please?

Mr. TYLER. I got there in July.

Mr. HOLIFIELD. What year?

Mr. TYLER. 1947. The defects in the houses did not show up immediately. They showed up sometimes as winter came and we got snow on the roofs and the snow stayed and got wet and gradually some ceilings began dropping into one of the bedrooms in two or three houses. That did not seem an illogical thing to happen, since houses do that and when you have 350 houses in one structure, you are bound to find a defect in one or two of them.

So I was not particularly perturbed until they began falling more consistently.

Senator HICKENLOOPER. Began falling apart?

Mr. TYLER. The ceilings in these particular rooms fell in completely.

Senator HICKENLOOPER. The floors buckled?

Mr. TYLER. No, the floors did not.

Senator HICKENLOOPER. Due to the water and drainage situation.

Mr. TYLER. One or two of the houses were badly sided and the drainage was not good. However, enough of them fell in so we decided to go into the whole business and repair them. The repairs became very extensive.

The question came to my mind as to whether the things were properly designed, and I requested the Army engineers in Texas—I did not want to get anybody locally concerned or the engineers' office in Albuquerque, with whom this architect's office does business—so I requested the Chief of Engineers to send me a board competent to examine into this, and he sent a three-man board up from Texas.

They examined into the whole situation, made a report on it, which I believe you have a copy of. In fact, I know you have a copy.

As a result of the report, it was difficult to decide who was wrong or who was right.

The CHAIRMAN. Who did that work? McKee?

Mr. TYLER. McKee did the construction and Kruger was the architect. The report did not indicate faulty construction.

The CHAIRMAN. He did not do as good a job with that as he did on this facility that he constructed in 4 months.

Mr. TYLER. May I go on, sir? The report did not show faulty construction. It did not show faults on the part of the contractor who did the construction.

The fault indicates, as far as they could decide—a fault was in the design and in the changes in design which were made during the construction period. Material was hard to come by at that time.

The CHAIRMAN. Who was the architect?

Mr. TYLER. W. C. Kruger.

The CHAIRMAN. Is he still working for you?

Mr. TYLER. Yes, sir. He is still working there. I can find no particular fault reflected in that report on either.

The board did not come up with a very solid determination as to who was at fault for a number of reasons, and the records are very unclear on it.

The indications were that, due to the difficulty of getting seasoned lumber, the specifications were changed during the construction period and green lumber was accepted. It was accepted by the Army engineers, who were inspecting the project. They made the determination and said it is O. K.

The changes in structure which should have resulted from that were not done. The architect claims he went to the inspecting engineer officer, who was a lieutenant colonel somebody or other, and said he felt this should be done, and they told him not to bother with it, that it would take too much time, and the houses were needed in a hurry.

The CHAIRMAN. The Corps of Engineers let the contract?

Mr. TYLER. The Manhattan Engineer District.

The CHAIRMAN. That is what I mean.

Mr. TYLER. Let the contract and superintended construction. The report, when it got through, particularly with the lack of records on much of this—the debate between the construction contractor, the architect, and the inspecting officers was done by conversations and by, “Yes, go ahead and do that, don’t do that”—so that the files do not reflect much of the change that was made.

The CHAIRMAN. When you sent for a board to examine into the deficiencies, you sent to have people come and judge themselves. Why did you send for the Corps of Engineers?

Mr. TYLER. This was a completely separate group of people, no connection with the Manhattan Engineer District or even the officers. I thought they were competent. They were civilian engineers with the Corps of Engineers. They did a good job. The report is available. It is a good report.

The CHAIRMAN. Now, it is 1:05. I think we should recess until tomorrow morning at 10:30.

(Whereupon, at 1:05 p. m., the joint committee adjourned, to reconvene at 10:30 a. m., Friday, June 24, 1949.)

# INVESTIGATION INTO THE UNITED STATES ATOMIC ENERGY PROJECT

---

FRIDAY, JUNE 24, 1949

CONGRESS OF THE UNITED STATES,  
JOINT COMMITTEE ON ATOMIC ENERGY,  
*Washington, D. C.*

The joint committee met, pursuant to adjournment, at 10:35 a. m., in the Caucus Room, Senate Office Building, Washington, D. C., Senator Brien McMahon (chairman) presiding.

Present: Senator McMahon (chairman); Representative Durham (vice chairman); Senators Connally, Vandenberg, Millikin, Knowland, and Hickenlooper; Representatives Price, Cole, Elston, and Hinshaw.

Also present: David E. Lilienthal, Chairman; Sumner T. Pike, Commissioner; Lewis L. Strauss, Commissioner; Gordon E. Dean, Commissioner; Henry D. Smyth, Commissioner; Carroll L. Wilson, General Manager; Carleton Shugg, Deputy General Manager; Frances Henderson, Assistant to the Chairman; Brig. Gen. James McCormack, Jr., Director, Division of Military Application; Walter J. Williams, Director, and Carroll Towne, Division of Production; Joseph Volpe, Jr., General Counsel; Everett L. Hollis, Office of the General Counsel; Morse Salisbury, Director, Shelby Thompson, and Rodney L. Southwick, Division of Public and Technical Information Service; Carroll L. Tyler, Manager, and John Macy, Director, Organization and Personnel, Los Alamos Operations Office; Richard W. Cook, Acting Manager, S. H. Cook, Acting Manager, S. H. Sapirie, Chief of Engineering and Production; and Fred W. Ford, Director of Community Affairs, Oak Ridge Operations Office; all of the United States Atomic Energy Commission.

Clark Center, General Superintendent; William B. Humes, Superintendent, K-25; Clarence E. Larson, Superintendent, Y-12; Oral Rinehart, Controller; Fred Uffleman, Supervisor of Materials Control Department, Y-12; E. N. McKay, Superintendent of Product Processing and Product Chemical Department, Y-12; J. M. Herndon, Superintendent of Chemical Division, Y-12; and Logan Emlett, Superintendent, Operations Division, Oak Ridge National Laboratory, of the Carbide & Carbon Chemicals Corp. (Oak Ridge).

Clinton Hernandez, Vice President; Lyle D. Worrell, Assistant Project Manager; L. C. Macneal, Project Manager; and St. John W. Davis, Audit and Budget Division Manager, of the Roane-Anderson Co. (Oak Ridge).

The CHAIRMAN. The meeting will come to order.

I have had delivered to me this morning a letter from Commissioner Strauss, which he would like to have read into the record. It is dated June 24 and addressed to me as chairman of the joint committee:

DEAR SENATOR McMAHON: I send you this letter with the request that it be made a part of the record of the current hearings of your committee. I do this because of my conviction that you desire the record to be as complete and accurate as possible.

On June 9, during testimony before your committee, I read from the New York Times of January 3 which quoted Dr. William Shoupp, manager of the electronics and nuclear physics department of the Westinghouse Laboratories, as follows:

"Isotopes also aid our scientists to find out what happens on the surface of a metal or alloy when it is exposed to extremely high temperatures. This information is vital to the development of new alloys for gas turbines, jet engines, and other high-temperature apparatus."

Four days later it was testified before your committee that "Dr. Shoupp regrets the misinterpretation of what he said." I should like to state that I have since communicated with Dr. Shoupp and offered to correct the record if he had been misquoted or otherwise embarrassed. Dr. Shoupp has written to me to say that the statements made in the New York Times article to which I referred are scientifically correct and that he has not been embarrassed by any reference to them.

Out of consideration for the time of your committee, I did not cite a number of other examples of applied research with radioactive isotopes. For instance, the Fourth Semiannual Report of the Atomic Energy Commission contains the following items: The General Electric Co. reported, "An investigation of high-temperature alloys, as applied to the gas-turbine field, is being carried out with the use of radioactive isotopes as tracers. \* \* \* Such an investigation is impossible without the use of radioisotopes." The Arthur D. Little Co., Inc., state, "Radiosulfur has been used to study the role of sulfur in the coking process for the steel industry. This study could not have been conducted without radioisotopes and was aimed at the ultimate production of better quality steel." The Socony-Vacuum Laboratories report, "In the study of oil production from oil sands, the nature of the three-phase flow of oil, water, and gas is a basic problem, since the most efficient exhaustion of present petroleum reservoirs depends on the nature of this flow. \* \* \* By using radioactive tracers in the oil, the location and quantity of oil flowing through the medium can be determined internally by a Geiger counter."

These and other instances of applied research appearing in our report deal with items which, like steel, oil, jet engines, gas turbines, rubber, and synthetic fuels, are the matériel of modern warfare. It is inaccurate to assume that radioisotopes are not extremely valuable for applied research.

May I now turn briefly from the use of radioactive isotopes generally to the specific matter of the initial export of such isotopes to a foreign military establishment. That fact was minimized in testimony on June 13 by the statement that the military establishment in question also engages in contract research for industry; and that the particular research project is to improve the performance of turbines for generating water power. The transcript does not indicate that any mention was made of the fact that this statement appears to have been based upon advices received by the Commission that morning—almost 2 months after the shipment had been made. Nor was mention made of the fact that also listed as a research objective of that establishment is the development of alloys for jet turbines to operate at high temperatures. It is my understanding that the primary present use of jet turbines is for high-speed military aircraft. The fact that a military research establishment may be located in a friendly country must be considered in the light of the stipulation that scientists, irrespective of nationality, are to have access to research conducted with radioisotopes obtained from the Commission.

In conclusion, may I be permitted to express my vigorous dissent from a philosophy which has been advanced before your committee, namely, that parts of the McMahon Act are not to be taken literally. That is a doctrine to which I cannot subscribe. If parts of laws are not to be taken literally, then the time and effort devoted to careful drafting are wasted—and we shall have to look for some other medium than words to codify them. For the equal and uniform administration of law is one of the pillars of our system of Government, and if public administrators generally were to construe laws other than literally, we would have as many interpretations as there are individual points of view. That would

mean complete administrative disorder. Certainly, the provisions of the Atomic Energy Act must be honored literally, or Congress should change them deliberately. If any of its provisions are ambiguous after nearly 3 years on the statute book, the ambiguity should be clarified by formal action. The implied alternative, that is to say, to permit any part of the law to become a dead letter is, to me, unthinkable.

Sincerely yours,

LEWIS L. STRAUSS.

Now, Senator Hickenlooper?

Senator HICKENLOOPER. Mr. Chairman, in order to complete the record so far as the Hanford situation is concerned—and it may be discussed later if it is felt desirable—this morning I received the so-called master plan for Richland, Wash., prepared by J. Gordon Turnbull and Graham, Anderson, Probst & White, Inc., engineers and architects of Cleveland and Chicago. This plan, as you will notice, consists of a booklet or folder in a leatherette cover. I would say it is 18 to 20 inches long and probably 12 inches wide and contains, in addition to the preliminary 3 pages of title and acknowledgment and index, 74 pages, which would be 36 sheets of paper, of the same approximate size as the cover, which in my judgment constitutes a very thorough canvass of the situation around Washington so far as climate, topography, building sites, previous locations of houses and installations, and the proposed future planning and zoning of that area for the anticipated town size, and seems to be a very thorough and well-developed plan.

In addition to the 74 pages that I mentioned, it has what might be called a supplement, consisting of some sort of plastic overlays, which give in various colors and various outlines on each transparent overlay a ready reference to various zoning locations and various activity locations in the present and future town planning for the city of Richland, Wash.

Unfortunately, I have this from a source to which I have to return it, and I cannot turn it over to the committee for that reason. However, I would suggest, Mr. Chairman, that this is a very thorough study, apparently, of that situation and indicates some very final conclusions about the city of Richland and its zoning. I would suggest that the joint committee request a copy or two of that document for its files, because I will have to return that one.

I may want to discuss it later when the people from Richland are here or when the Commission desires to discuss it and to discuss some of the provisions in it.

Then, in order to further complete the record, I have just this morning received a copy of a bulletin of the Allied Daily Newspapers of Washington, with headquarters at Olympia, Wash., which is dated June 17, 1949. Among other things, most of which are not pertinent to this inquiry and refer to certain journalistic interests out there, there are the following two or three paragraphs, which I believe are pertinent to the question of business policies in and around Richland. I would like to put those in the record at this time.

One section of this bulletin, which for identification is their bulletin entitled "General Bulletin No. 18, June 17, 1949"—this particular section which I would like to read at this time is as follows. It is headed "Atomic Energy Commission Denies Newspaper Monopoly Plan," and reads:

In reply to the resolution adopted by Allied in May, relating to a proposed monopoly newspaper operation at Richland, Sumner T. Pike, Member of the

Atomic Energy Commission, has declared that the Commission does not plan and has not ever contemplated such a monopoly within the Hanford project. He said the resolution "seems to indicate a complete misunderstanding of the action by the management of the project." In support of this statement he pointed to the recent call for bids on the establishment of a newspaper plant or plants on the project in which six sites were open to bidding without restriction on the number of successful bidders up to six.

His reply gave no recognition to the following facts:

1. The Hanford management has consistently followed a monopoly policy or at least closely restricted competition in all lines of business admitted within the area.

2. The AEC through a qualified and authorized representative requested Allied to appoint a committee to draft bid specifications for a *monopoly* operation of a daily newspaper in Richland.

I call attention to the fact that in their bulletin they underline the word "monopoly." To continue:

3. After Allied had refused to accept the responsibility for such a committee a representative of the Commission appeared personally before the executive committee of Allied, seeking publisher support for a *monopoly* bid plan.

Again the word "monopoly" is italicized. To continue:

4. Discussion of a competitive or potentially competitive newspaper operation was publicly entered upon by the Commission only after Allied had declared its support for free and unlimited newspaper competition.

5. The bid form finally offered by the Commission, while ostensibly opening the field to more than one newspaper, so subjects successful bidders to cancellation clauses and other control features as to destroy effectively economic freedom.

6. The successful bidder or bidders would be called upon to operate a newspaper within a market wherein all advertisers or virtually all advertisers could be subjected to external pressure from the AEC through cancellable lease agreements upon which their own economic existence depends.

The executive committee has directed that these points be drawn to Mr. Pike's attention in an effort to clarify the misunderstanding which is presumed to exist.

Mr. Chairman, that is all of the bulletin which pertains to this matter, and I will ask the reporter if he will just put in that portion of the bulletin because the rest of it refers to their own other private business.

Then I have also received a bulletin of the Commission or of General Electric or both, because the bulletin refers inquiries to either the General Electric or the—well, it apparently is put out by the General Electric Co., because it refers inquiries to General Electric Co. Commercial Facilities Division, Municipal Building, Richland, Wash., with telephone number. This bulletin is entitled "Development of Richland, Wash." It contains a foreword of 3½ pages, which I shall not burden the committee at this time repeating, and then an attachment showing the type of stores and business enterprises which are in existence now and the anticipated new number to be added, and then the anticipated total.

For instance, I will read two or three of them. At the time this bulletin was published, there were five combination stores, grocery and meats. They anticipate a new number of six or an additional number of six. In other words, they anticipate that they will permit 11 of those stores to go in.

Milk dealers—they had one. They anticipate that one more will be admitted in the area.

Department stores—they had one. They anticipate that one more will be permitted to come in, or a total of two.

Men's and boys' clothing and furnishings—they had one at the time this bulletin was issued. They anticipate that two more will be permitted to come in; so that there will be three.

Women's accessories stores—they had none at the time this bulletin was printed, and they anticipate that they will permit one to come in and operate.

Shoe stores, all kinds—they had one at the time this bulletin was published. They anticipate that they will permit one more shoe store to come in.

Furniture stores—they had none, but they anticipate that they will permit two.

Motor-vehicle dealers—they had one. They anticipate that four more will be permitted to come in. That is, dealers in new motor vehicles. So that they will have a total of five.

Gasoline stations—they had four at the time this bulletin was printed. They anticipate that seven more will be permitted to operate in Richland, so that all they will have 11 altogether.

Leather- and luggage-goods stores—none at the time this bulletin was printed some several months ago. They anticipate that they will permit one leather- and luggage-goods store to come in.

Drug stores—they had three and anticipate eventually they will permit eight.

Cafeterias—they had one and they anticipate not permitting any more cafeterias to come in; so they will retain one.

Restaurants—they had two and they anticipated that three more will be permitted to come in, or a total of five.

I am skipping along this list, Mr. Chairman, but I give it for illustration as the apparent controls under which they operate in a so-called free-enterprise community.

I submit that for a community of 30,000 people, that the number of business establishments as shown on this list that they anticipate they will permit to come in, is far below and a smaller percentage of the average of each of these classifications of business enterprises in a normal city of that size. I submit that in any kind of a restriction on free enterprise, it furnishes extremely fertile grounds for monopoly and for the centering of profits and opportunities in a few individuals.

I would like, Mr. Chairman, if that full bulletin, together with the attachments that I have referred to, can go in the record at this point.

The CHAIRMAN. Very well.

(The bulletin and attachments referred to above are as follows:)

#### DEVELOPMENT OF RICHLAND, WASH.

##### FOREWORD

The purpose of this bulletin is to furnish information regarding the further development of necessary merchandising, light industrial, warehouse and allied businesses in the Government-owned town of Richland, Wash., under a new policy recently announced by the Atomic Energy Commission, the aim of which is to develop Richland along the lines of a normal American community.

*Location and history.*—Richland is located in Benton County, in southeastern Washington, near the junction of the Columbia and Yakima Rivers. The community is served by the Greyhound bus line on its main-line route from Walla Walla to Seattle, and by the Tri-City bus line, operating out of Pasco, Wash.

Pasco and Kennewick, located respectively 12 and 10 miles east of Richland, provide the nearest passenger-train service. The railroads are the Spokane, Portland & Seattle Railroad, a subsidiary of the Northern Pacific and Great Northern

Railroads, and the Northern Pacific and the Union Pacific. Nearest transcontinental air transportation service is at Walla Walla, Wash., located approximately 65 miles southeast, and Yakima, Wash., located approximately 80 miles northwest of Richland. Connecting air-line service to Walla Walla and Seattle is available through Inland Airways, operating from Vista Field located between Richland and Kennewick.

Until World War II, Richland was an incorporated farm community with an estimated population of 300 persons. The entire town, together with several thousand acres of land lying between the Columbia and Yakima Rivers, was purchased by the United States Government in 1943. Immediately thereafter, a construction program was begun for the erection of housing for operating personnel, for limited commercial facilities, and for the erection of facilities for the production of plutonium, which is an ingredient of the atomic bomb, and which, in addition, has important potential peacetime applications. The first construction program ended during the early part of 1945.

*Population.*—Under the original production program, a maximum population of 15,000 to 16,000 persons was reached during the winter months of 1946-47. It is anticipated that the population in the permanent town of Richland, by July 1, 1949, which is expected to be minimum, will be from 25,000 to 26,000.

In 1947 a temporary construction camp was established at North Richland, approximately  $4\frac{1}{2}$  miles north of Richland proper. This camp now has a population of approximately 13,500, which may remain at the present level for the next 2 or 3 years, and then decline to zero about 1953.

*Housing.*—During the original construction program, a total of 4,303 family units of housing were provided. Dormitory accommodations, to provide for 304 unattached men and 682 unattached women, were also constructed.

When new impetus was given the atomic energy program in the fall of 1947, it became necessary to provide additional housing for operating personnel. As of July 1, 1948, a group of 847 houses and apartment units were nearing completion, and an additional group of 1,000 single family dwellings were under construction, scheduled for completion by December 1948. Additional dormitory space for 230 men also has been provided.

North Richland has barracks for men, dormitories for women, 200 houses for supervisory construction personnel, and about 1,900 spaces for trailers, with room for as many more trailer accommodations as may be required.

*Town operation.*—Richland and North Richland are operated for the Atomic Energy Commission by the General Electric Co., under its contract with the Commission. The General Electric Co. handles the selection of all commercial operators for the permanent town of Richland and the construction camp at North Richland. Only employees of the Commission, General Electric, subcontractors or facility operators are permitted to have housing in these towns.

*Commercial facilities.*—During the war, commercial facilities to meet only the absolute minimum requirements of the local population were provided. All new commercial buildings in the town of Richland were constructed at Government expense, and all of the original buildings which were usable were also occupied.

A recent determination, reached by the Atomic Energy Commission, to develop Richland along the lines of a normal American community, has resulted in a change in policy regarding commercial facilities. Instead of the Federal Government constructing business buildings, land is now available on long-term license agreements, between General Electric, as prime contractor for the Atomic Energy Commission, and businessmen, to permit them to erect their own structures in which to conduct their own business, or to erect complete shopping centers to be subleased.

*Town planning.*—The wartime town of Richland, as originally built, was carefully planned in detail on the drawing boards before construction began. With the present permanent expansion of the town becoming necessary, professional town planners were employed and have laid out the new areas for business and home sites, and for all the essentials that make up a community of 25,000 population.

The growing town will have two business districts, approximately 1 mile apart. This arrangement will prevent the traffic and parking problems that plague the merchants of most American cities. The town has elbow room, and it is designed for modern living. But, at the moment, it lacks the commercial enterprises to complete the pattern.

In keeping with the planning, it is intended that the best type of commercial operators shall serve the residents. It is believed that private enterprise can best meet this requirement for expanded commercial facilities.

The attached diagrams show the expansion of the growing town, as laid out by professional town planners.

*Method of selection of operators.*—Commercial operators for Richland are generally selected by General Electric Co., through invitations to bid. In most instances, the rental bid is based on a percentage of gross sales. All factors, including experience, trade connections, character, and financial resources, are taken into consideration in the selection of commercial facility operators.

The rental offered must be sufficient to cover costs for electricity, water, sewage, such municipal expenses as police and fire protection and street maintenance, and to provide a fair return for the use of the land. At present, electricity and water are not metered.

The attached list shows the present stores in Richland and the probable number of new stores desired. There is no guaranty that these totals will not change in the course of time, but, at present, they appear to be the proper numbers for each type of business.

All inquiries and expressions of interest regarding the possibilities of constructing and operating needed businesses in Richland should be directed to General Electric Co., Commercial Facilities Division, Municipal Building, Richland, Wash.

(If telephone contact is desired, phone Richland, Wn., extension 248 or 384.)

Liquor store: Relocate in site 16-X, drawing D.

Bank (enlarge present structure).

Post office (enlarge present structure).

Branch post offices: Substations in site 1, drawing D, and in neighborhood stores.

Total anticipated new facilities, 104.

Mr. HINSHAW. Mr. Chairman, in connection with that list I notice that under the lumber and building material groups there is provided that under "Heating and plumbing equipment" the present number is one, the anticipated new number is one, for a total of two.

I believe that the present number of one includes a concern known as the Richland Plumbing & Heating Co., which is a subsidiary of W. P. Payne Co., of California.

I happen to know that that company is withdrawing from the scene, and I think at this point I would like to have permission to insert in the record the complete correspondence on that subject, both with the Payne Co. and with the Commission, in order to indicate the reasons why they are withdrawing from the scene.

The CHAIRMAN. Very well.

(The correspondence referred to above is marked "Exhibit 20," and will be found in the appendix.)

Mr. HINSHAW. They have made a ground lease with the Commission on a piece of land, constructed a building and furnished it with equipment and supplies at a cost of something like \$70,000, in anticipation that they could enter the plumbing and heating business, and found that they could not do so, and are withdrawing, according to the last word that I have.

Mr. COLE. For the information of the committee, can you tell us why they are withdrawing?

Mr. HINSHAW. There was same indication, as I remember the correspondence, that the local plumbing and heating business, the repair business and that sort of thing, was to be turned over to private enterprise, and so they made the investment; but there was no guaranty to that effect, and the General Electric Co. decided to conduct on its own account, and consequently there was no business for it to do after it constructed the building.

There is a question I would like to raise in that connection. When a company comes in to Richland in good faith and invests its money, as in this case, to the tune of something like \$70,000 in building and equipment and withdraws from the scene, what happens to the building? The land is owned by the Government and must they forfeit all value that they have, or will their investment be returned to them when they have to withdraw from the scene because of no business?

That is a question that is apparently up at this time, and I do not know whether or not it has been settled, but it is a very unfortunate position for a company to be in, I can assure you, from reading the correspondence and talking to the principals in the case.

The CHAIRMAN. Do you have any comment to make, Mr. Shugg?

**STATEMENT OF CARLETON SHUGG, DEPUTY GENERAL MANAGER,  
ACCOMPANIED BY JOSEPH VOLPE, JR., GENERAL COUNSEL,  
UNITED STATES ATOMIC ENERGY COMMISSION**

Mr. SHUGG. I would like to speak of that situation, because I think it is important for me to make clear the situation when these numbers were gotten out. These numbers are not intended to be any long-range or permanent Solomon-like decision as to what the city should have.

The situation when these were gotten out in the summer of 1948 was that there were only 37 concessionaires there, and, except for a few gaps in between those buildings, there was no room for others.

There was also a terrific increase of all facilities out there. Everything was on the increase, as I said in previous testimony. The population was going up from 11,500 to 36,000 total, and it did triple itself that way in less than 18 months.

Now, we were short of everything and we had two extremes in front of us. The 37 original, one-of-a-kind concessionnaires that the MED selected to give a balanced immediate service to their employees—we had that as one extreme of a minimum; and south of our borders we had a boom town there of the most extensive proportions.

Now, the important thing, if I can make it clear, is that I believed then and I believe now that we had to control the rate at which the town was opened up and expanded, because it did cost us money. It cost the Government money for every man in that town. With the increase that was taking place there and the high need for priority of men and materials and equipment to be put on the plant work, any use, even by other contractors, of the short labor supply in that vicinity for just what anybody would like to do in that town did have an effect upon the amount of those short items of labor and material and equipment which we could have for the plant work.

So we definitely did our best to control the rate of expansion. That applied even in our own workings. We had to send architect-engineers' men back to their home offices to do work of the high priority type, which we would ordinarily have liked to have them do out there on the spot, but we accepted the poorer communication and the need to get men off that territory, because as regards water supply, sewage treatment, lights, transportation, eating facilities, we were short on everything and we had waiting lines, as I said yesterday, spring up there overnight.

We did not believe that we could leave it be at 37 only. We had to start and start somewhere. In order for that starting move to open up the amount of facilities there, to be most effective, we did attempt to say what facilities were needed the quickest, and yet there seemed to be two sides or more to almost any coin we picked up.

We did have some landlord responsibility, and we had the very definite responsibility of preparing the land for any of these people that came in. We had to start with sagebrush and grade and put in all the utilities and streets and things for any of these new concessionnaires to come in.

Now, as to how to do that, we did give it a great deal of thought. It was recognized that if we set aside an unlimited piece of land there, even if we did make the decision to use scarce men, materials, and

equipment to open up and develop that land and make it suitable for concessionnaires and then made it a carte blanche as to who came in there, we would almost have to make it like the land rush days to get free competition and we would have to have everybody know about it and we would have to have a starting time.

If it was just first come, first served, I do not think that that would have been as fair as the efforts that we did make to get competition. First come, first served would leave room for leaks through any big organization like that. It almost looked to us as though, if we were to open this up to let nature take its course, we would have to open up a very large piece of that desert land. There was not any of it available in the center of town where these businesses would be wise to set up, and then we would have to practically set, after advertisement, a starting point and a dead-line date and fire a gun and let the first-come, first-served principle take effect. I think that the important thing is that, as I said, you have to consider when we did this. It was in the summer of 1948. We were still on a sharp increase, and any men, any people in Richland cost us money in one way or another, because there was not enough of anything.

There was no thought that this would be the end of it.

Senator HICKENLOOPER. Mr. Shugg, I think you and I are in agreement that there were problems that had to be met, emergency problems in the past.

By the same token, apparently, those problems have been met because this planning survey that I have produced this morning here indicates a beginning of well over a year ago of a master plan anticipating the future, zoning operations, and zoned areas in anticipation of this city of Richland.

It looks to me, without having had time to read it, as though it is an extremely thorough job that has been done. I am not criticizing the scheme of the planning, the scheme of the situation. I might have some criticism when I read it, I do not know, but it looks to me like a great deal of time and trouble has been spent in anticipation of the future needs of this community.

I am not talking about the days when the gold rush was on, nor am I talking about some of the manifest troubles that I know you had and that would try the disposition of a saint, perhaps, at times. I am talking about present policies of the Commission in the operation of a so-called free-enterprise town or the stimulus of a free-enterprise town, and while I think this bulletin that we refer to was developed late last year—it refers to July 1 figures and things of that sort—so I presume it was late in the summer, at least, when it was produced. It is the present policies that I am concerned with, and I am perfectly willing to admit that in the past the emergency of war and the emergency of transition did pose some problems, but it seems to me that those have been pretty well met now by a master plan which seems to be comprehensive, and I am objecting to what I believe is a continuation of the utter monopolistic control or paternalistic control, if you please, over what is supposed to be or bandied about as being a free-enterprise operation of the town of Richland now.

Mr. SHUGG. I think I can help on that, Senator, in that all you have seen so far in print has been based on the Richland problem, which is still not completely licked. I mean the small initial commercial terri-

tory which we did spend the money on to open up, that has not been filled up yet, and all this policy you have seen was based only on Richland. Since the middle of February of this year we have had under consideration here in the Washington office and between Oak Ridge and Washington the commercial policy for Oak Ridge, because it is recognized that there we do not have all the same conditions. We do not have the condition where every foot of land that we open up will cost us money.

The long-range commercial policy for Oak Ridge, which is in our staff right now, is considerably different from the Richland one.

Senator HICKENLOOPER. Oak Ridge just became an open town, you just took the fence down a month or two ago.

Mr. SHUGG. That is—

Senator HICKENLOOPER. Up to that time it was a restricted town.

Mr. SHUGG. The fence was opened up the middle of March and the people foresaw this by at least a month, because if I am not mistaken, it was in early February that the first staff papers as to what would be the commercial policy in Oak Ridge were sent here to Washington.

That policy, which I have seen, is considerably more open than is the interim Richland policy. So that what you have seen in all these things is really cut to suit a situation which was special to Richland, and which is even dependent on time. It need not be so as the Richland jam eases. But the next one that we have under consideration and have had for several months is of an entirely different order because the circumstances at Oak Ridge allow us to relax and make a much more open and competitive basis.

Senator HICKENLOOPER. I really had not intended to go into the Hanford situation this morning, because I had told them yesterday I would not do much about it until a later date, but as long as Mr. Shugg is here, who has a great familiarity with this, I would like to ask him:

Are you familiar, Mr. Shugg, with this so-called master plan for Richland I have here?

Mr. SHUGG. I am quite familiar with the detailed explanation and studies that went to make that up. The fancy format there and all the colors, that is something I did not foresee.

Senator HICKENLOOPER. I am not raising any particular issue on the fancy format. It is pretty fancy, but this may be a special copy or something.

Mr. SHUGG. The basic material there, Senator, we did initiate as soon as we got out to Richland, because everything was on a short-as-your-nose basis. There were women's dormitories that had been placed there next to the commercial district of the town. They could not be expanded.

Senator HICKENLOOPER. I understand the boom-town nature; I have seen it two or three times and understand it thoroughly, and I am in thorough agreement that some master planning for the future of that community is utterly indicated and very proper.

I am not saying that it should not be. Again I say I am familiar, at least to some extent, with some of the historic problems there. It is present policy with which I am concerned. About this so-called master plan, it was prepared by J. Gordon Turnbull, Inc., and Graham, Anderson, Probst & White, engineers and architects. They state in

here in the foreword—this was finished November 30, 1948, incidentally—they say:

With the submittal of this report, the planners climax a year of work devoted to the collection of data relating to the people of Richland, their activities, their present living facilities, and their projected living needs.

Now, that is signed by J. Gordon Turnbull.

Did J. Gordon Turnbull, Inc., do anything else for the project out there besides this work?

Mr. SHUGG. The joint venture, Senator, of those two firms did a good deal of the town work.

Senator HICKENLOOPER. Those two firms, J. Gordon Turnbull, Inc., and Graham, Anderson, Probst & White, Inc., those two firms did the work in the preparation for this master plan for Richland; is that correct?

Mr. SHUGG. Yes, sir.

Senator HICKENLOOPER. They say that it climaxes a year's activity. Do you know what the total amount of money, the gross amount of money paid for the compiling of this master plan to those two companies is?

Mr. SHUGG. No, sir; I do not have that figure with me. I knew I would be asked for it as soon as this thing came under discussion, but I do not have it at the moment.

Senator HICKENLOOPER. I shan't criticize you for not having it this morning, because I did not know it was going to be brought up, but I would like to have the gross total amount of money paid for the compilation of this study and for its printing and its preparation and the whole situation.

Now, I would like to ask this. This was done on separate contract with them, was it not, either through General Electric or the Commission?

Mr. SHUGG. It was a General Electric contract with these people, but my office instructed General Electric to get a town planner and to get a picture of the whole thing.

Senator HICKENLOOPER. Reimbursed by the Government; the cost?

Mr. SHUGG. Yes, sir.

Senator HICKENLOOPER. Now, the Commission maintains at Hanford an office of community management, does it not?

Mr. SHUGG. Yes, sir.

Senator HICKENLOOPER. How many people are in that office?

Mr. SHUGG. I do not think there are more than five or six people. That was a small staff office. In my time there were five or six people who tried to keep in touch with all matters pertaining to the community and town and keep me informed on them.

Senator HICKENLOOPER. The General Electric maintains a community division, does it not?

Mr. SHUGG. Yes, sir. They do the actual operating of the town.

Senator HICKENLOOPER. The town operation, and in neither of those, either the atomic energy community management office or the community division of the General Electric Co., do they have people who are capable of conducting such surveys and charting out the future of that city?

Mr. SHUGG. I did not think so at the time, Senator. I may have done an injustice to the ability of some of those people, but also most

of those people had been living too long in the woods, and I wanted to get—I directed that we get an outside objective professional study of this whole package.

The work to date did not demonstrate that decisions had been made with the whole picture in mind. They were pretty much spot decisions. I think the plan was sound and the 35,000 figure in there, Senator, was also at our suggestion because, although we had no present picture of it going that far, if the original town plan had been laid out with a bigger possibility in it, some mistakes would have been avoided; and so we made a 25,000 step here and a 35, and a 35 is admittedly just to keep any of these dispositions from being too short-sighted.

Senator HICKENLOOPER. That is all I have.

Mr. HINSHAW. Mr. Chairman, I wonder since Mr. Shugg is quite familiar with this situation in reference to the Richland Plumbing Supply Co., if he would be willing at this point to detail the Commission's position in relation to this company and state how it started and why.

Mr. SHUGG. Yes, sir. In the spring of 1948 we first began this move to try and get outside commercial interests and outside light industry to come in at its own expense. Prior to that we had a very large item in the budget for building facilities for all these needed people.

In the spring of 1948 we definitely tried to promote what we felt then were the good business prospects for light industry and for some of these concessionnaires to come into that town.

Lots of those people came to my office. There was a good deal of question in the minds of these people we were trying to get in there and make a business venture; they all had the usual wonderment as to how long this thing was good for and how about the annual appropriation of funds.

Whenever we put up the fact that everybody was at work, they would counter with the fact that as a one-industry town and dependent on annual appropriations, that was not in their favor.

Lots of these people came to my office, Mr. Hinshaw. I encouraged them all I could. Mr. Payne was one, and I remember his coming particularly, because I knew that it could not help but be of assistance in the bargaining which the contractor was then doing with the labor unions if we had an established licensed plumber in town rather than 12 miles away in the nearest town.

I encouraged Mr. Payne personally as to what I thought were the prospects for a plumber in that town. I did the same thing—I went up to Spokane and spoke to the chamber of commerce. I saw Mr. Payne this spring in connection with his present dilemma, and I still encouraged him, because that is the way I honestly feel about it. I do not know why Mr. Payne did not make out.

I tried my best to find out. I think the mistake I made was that I did not get two plumbers in at once. Looking back, if instead of Mr. Payne, we had brought in two, then we would have had no chance for excuses that Payne's prices were too high. We would have had a check between two.

Mr. HINSHAW. Would you mind stating the circumstances under which Mr. Payne happened to come to Richland? I believe he was a contractor in some of the building that went on there, and I believe

that the Commission is willing to admit that upon his entry into the contracting business in Richland and the arrangement whereby his contract did not include this so-called isolation pay, that he saved the Commission something on the order of \$3,000 a day or a week or whatever the period was in that kind of pay.

Mr. SHUGG. You would like, sir, for me talk on that travel-pay point?

Mr. HINSHAW. I do not have it in front of me, but I would like for you to indicate how he happened to come on the scene.

Mr. SHUGG. I believe one of the plumbing contractors there engaged in the labor negotiations made the point that, according to the Washington State plumbers' rules, we were at a disadvantage; that the contractors were at a disadvantage in trying to get the minimum of isolation pay—that was the fancy term given travel pay—because there was no licensed shop in Richland itself. We did have one electrical shop and there was no plumbing shop at all.

Now, without question, Mr. Hinshaw, anything which would help the negotiations of the contractors with the unions to come out with a lower fringe payment we would try to help, if all other things are equal and it was to the good of the Government.

Mr. HINSHAW. Is it true that his entry on the scene saved a considerable amount of this so-called isolation and travel pay?

Mr. SHUGG. I tried the first of this week, Mr. Hinshaw, when I thought this subject might come up; I tried to refresh my own memory by calling the Richland labor-relations man to get first-hand facts on that. He was not there.

The deputy manager, who was closer to it, said that he had asked him before he left the same question and that he has not been able to get it down to a black-and-white basis.

Mr. HINSHAW. In all events, in the work done and offered by this company, there was no isolation pay arranged for?

Mr. SHUGG. I did not hear the first of it.

Mr. HINSHAW. In the work done by this company no isolation pay was paid, was it?

Mr. SHUGG. If Payne, whose shop was in town——

Mr. HINSHAW. I am speaking of prior work—his prior work prior to the erection of the shop. I believe he did certain contracting and plumbing.

Mr. SHUGG. I believe he had certain subcontracts.

Mr. HINSHAW. And it did save the Commission a considerable amount of money by virtue of the fact that there was no isolation pay in those subcontracts?

Mr. SHUGG. I cannot speak with certainty on his contracts prior to his coming in town. I think you are right that he had some small subcontracts, and, if they were lump-sum contracts, he may have been paying his men travel and travel time from the nearest licensed Pasco shop.

The initial payments by lump-sum subcontractors had a good deal of variation in them, according to their own union agreements. The big general agreement that we were up against for the general contracting of the whole technical area is the thing with which I am most familiar and I do not have personally any doubt that the establishment of a licensed plumber in town did have a beneficial effect on our

being able to hold the general plumbers union for the big job down to \$2 a day isolation pay.

Mr. HINSHAW. This was all outside the barricade and, hence, there must have been some general time at which the isolation pay for work outside the barricade was terminated. Do you remember when that was terminated?

Mr. SHUGG. It was not isolation pay. This is just a technicality. Outside the barrier in the town it was not isolation pay. It was pay up from Pasco. It was really travel allowance then up from Pasco, and, to the best of my memory, that did change at the time Mr. Payne set up shop. At least, it should have, because, according to the Washington State rules, the basing point for travel and travel time is from the nearest licensed plumber's shop.

Mr. HINSHAW. You did lease land to him for the purpose of constructing a building to set up a plumbing establishment, did you not?

Mr. SHUGG. Yes, sir; through the General Electric commercial facilities division.

Mr. HINSHAW. And he did erect a building and put in equipment and supplies?

Mr. SHUGG. Yes, sir.

Mr. HINSHAW. And he did offer to bid on certain town-site work in connection with the General Electric Co.'s management program of the town and did bid, I believe.

Mr. SHUGG. I understand he did.

Mr. HINSHAW. And the bid price was found to be too high. Was that too high because General Electric decided to do it at a cheaper price, or was it too high because of the competition of some outside plumber?

Mr. SHUGG. There could have been some cases of each type, sir. Mr. Payne told me this spring that some of the bids that he made on subcontracts or plumbing work, that he had been high bidder or he had not been the low bidder. He did not regret those, he told me, because the low bidder had made out very poorly in some of those cases.

He told me he had done quite a little work for the concessionaires, coming into town and putting up their own buildings. This whole opening of the town to private investment capital did give him some business, and he, being the first man on the spot, was the most advantageously placed to get that business. I think that is the biggest type of business that kept him going.

Mr. HINSHAW. Do you think he was encouraged to believe that he might get any maintenance work being done by the General Electric Co.?

Mr. SHUGG. I think, Mr. Hinshaw, I told him personally in the spring of 1948 that I hoped we would be able to work it out so that the ordinary tenant plumbing work of the houses would cease to be done by the operator and that a town plumber would have that business.

Mr. HINSHAW. But the operator decided to do that work himself, I take it.

Mr. SHUGG. It had been done by him, sir, and the progress in breaking that loose was not as fast as I had hoped when I talked to Mr. Payne.

As a matter of fact, that part of it starts August 1 of this year with a new rental policy, and the fact that the tenant will take care of his

own normal maintenance. That is being put in August 1 this year, which is quite a little later than I had hoped for.

Mr. HINSHAW. Obviously, the gentleman has decided he can no longer afford to stay in Richland. He has an investment there in plant and equipment on the order of \$70,000, according to his statement.

Of course, material and equipment can be removed, but what about the building? Does the Government make any guaranty on the repurchase of buildings constructed there, or does that go to the Government by default?

Mr. SHUGG. I can check that in the terms of the lease. If he terminates on his own decision, he has the right to remove the building. It does not just revert to us. If we terminate him, which is not the case here, we have to make good on the then value of the building.

Mr. HINSHAW. You do not terminate him as such, but in effect he is terminated when he cannot get any business, is he not?

Mr. SHUGG. Well, he evidently has decided, sir, that he does not wish to continue. Therefore, I will try and check.

He has the right to remove the building or sell it.

Mr. HINSHAW. All he can get is the scrap value if he tries to remove it, as I understand it, so it would not be a very profitable venture. Who can he sell it to? Have you any idea?

Mr. SHUGG. No; I do not have a specific idea. There are others coming in there, sir, and the town, which is now 25,000—the town is going to have a plumber. As I said, I think probably the biggest mistake we made was not to get two men in instead of letting one man come in first.

Mr. HINSHAW. Here is a man who built a building on land leased to him by the Government, and the Government has a right to say who can come in and do business in the premises, and the chances are pretty good that he will not have but one bidder on the property if he wants to sell his building.

Now, under those circumstances, how is he going to get a fair price for the building which he has erected?

Mr. SHUGG. I agree with you, Mr. Hinshaw, that I do not see any quick way for him to get a good price.

Mr. HINSHAW. I mean a fair price.

Mr. SHUGG. The same. I think a plumber or plumbers are definitely going to come into town, and, therefore, there is at least somebody who will be interested in his building. I am just speculating.

Mr. HINSHAW. He is at the mercy of anybody the Commission would allow to come in and operate a plumber establishment, is he not, when it comes to negotiations for the sale of his premises?

Mr. SHUGG. Mr. Hinshaw, I think if he is on the spot and studying this problem, he would have other outs. I, on the stand, cannot think of them quickly enough. I do not think he is completely at the mercy of a man coming in.

Mr. HINSHAW. Mr. Chairman, I brought up the subject because obviously when a concessionaire comes into Richland or any other Government-owned town and erects a building on Government-owned land and the Government at the same time has the right to say who shall come in and who may be able to bid on the premises, if for any reason the concessionaire, as he is termed by Mr. Shugg, is forced to withdraw, he is in a rather difficult position so far as the disposition of the property is concerned.

Practically speaking, there is only one fair buyer—if that buyer is fair—and that is the United States Government or its nominee. But there is no guaranty whatever that he can get cost less depreciation out of the premises. He is pretty much, I think, at the mercy of whoever the Government says can operate and occupy those premises.

Mr. SHUGG. I am very sure, Mr. Hinshaw, that we have drawn this so that we definitely avoided any guaranty that anybody who drops out would be made whole, because then we would have a contingent liability for all of this construction of facilities, which is the very thing we are trying to avoid in getting the private capital to come in.

Mr. HINSHAW. I agree that the Government would assume a great liability if it went into that, but at the same time, the Government does control as to who may be able to come in and build on the premises, does it not?

Mr. SHUGG. I do not like to say yes, sir to the word "control." I fairly believe that we have opened this to competition of the best men, except that I have said that we controlled the rate at which we could make new commercial areas available. We have only controlled the rate of expansion, Mr. Hinshaw, and within our best judgment and the amount of funds that we have, for which we first have to get congressional approval—within those limits we have made this thing as open to competition as we know how.

Mr. HINSHAW. I am only using this as a case in example, not because anyone is feeling terribly unhappy about it, but just to show that under a case of this sort anyone who is to come in and establish a service establishment such as this would find himself at the mercy of the Government and operator because, as Mr. Shugg has said, while they intend to open the town as far as home occupation is concerned by leasing the premises and turning the maintenance of those premises over to the lessees and, hence, the lessees would have to go to a private, in this case, plumbing establishment for repair work, that at any time the operator or the Commission decided to take back the operation of the town, which I believe they could do at will, such a concessionaire would be out in the cold so far as any opportunity for profitable business is concerned.

Mr. SHUGG. If we took it back, Mr. Hinshaw, we have to make good.

Mr. HINSHAW. You do not have to take it back.

Mr. SHUGG. It is written in here that if the Government takes over for a proper reason, then we have to make good, but if the tenant fails or does not find it profitable to continue, and if we were to guarantee making him whole, then I think we would have a whole new complicated picture as to what safeguards we would have to set up in picking those tenants, because we would have the contingent liability of the total capital investment that he made.

Mr. HINSHAW. Mr. Chairman, I have not been to Hanford yet, but I was down to Oak Ridge last year, and I remember quite clearly that at that point one of the concessionaires in a Government-owned building decided apparently that he could not make a go of it there under the circumstances, and so he simply jumped shop. He walked out of the place with whatever cash was in the till and left the supplies that he had on hand and whatever equipment he had installed and walked off the job. There was no other way, apparently, for him to get out whole except to do that.

Now, that is a situation which is very difficult to contemplate and one which I think would be somewhat of a restraint upon these so-called concessionaires going into a Government town and doing business. I call that to the attention of the committee for its consideration, and I will place the entire correspondence in this connection that I have been mentioning in the record for the committee's study.

The CHAIRMAN. Very well.

(The correspondence referred to above is marked "Exhibit 20" and will be found in the appendix.)

The CHAIRMAN. I would like to go now to another matter. I do not want to cut you off, Mr. Shugg and Mr. Volpe.

Mr. Volpe, have you anything?

Mr. VOLPE. Just one very brief point.

The CHAIRMAN. I hope it is brief.

Mr. VOLPE. Very brief, sir. I am puzzled by the fact that we have to come before this committee and explain why in letting land at Hanford, which is scarce, we do it by competitive bidding. I have usually found myself in the position of having to explain why it is not done by competitive bidding.

I could imagine the screams that would come out if we attempted to negotiate with private individuals the desirable plots at Hanford.

We have tried very hard to consider ways and means of permitting everyone a fair and equitable opportunity to acquire the desirable commercial locations in these communities, and we do not know how it can be done except by competitive bidding.

Mr. HINSHAW. Mr. Chairman, there was no competitive bidding in this case. This land was leased, a plot of land in the warehouse area, by direct negotiation and the tenant proceeded to build a building.

Mr. VOLPE. I was not discussing the Payne case. This goes to the question of why we have to use competitive bidding.

On the question of controls, as I mentioned the other day, the Manhattan District had—and I think properly so at the time—very restrictive concession arrangements and leases because of necessity. When it was determined that we ought to try to move toward a more normal community, the people on the spot tried a new form of lease and eliminated many of the restrictions. A number of them were kept in.

As a matter of fact, when I first arrived in Washington, a number of us wondered why the restrictions which were left in should be left in. Response from the local people was usually—and I think this is fair: "Well, come out and see for yourselves. It is easy sitting off a couple of thousand miles saying 'This is not necessary' or 'That is not necessary.' We have the responsibility on the spot."

Well, this is just to say that we are not dogmatic about the matter of controls. As a matter of fact, within the Commission itself there have been varying views on how much is necessary and how much should be eliminated. I think it is a matter that will be worked out but will take a little time.

The CHAIRMAN. Now, we have another matter. Will the Los Alamos gentlemen come forward?

**STATEMENT OF CARROLL L. TYLER, MANAGER, SANTA FE OPERATIONS OFFICE, LOS ALAMOS; ACCOMPANIED BY BRIG. GEN. JAMES McCORMACK, JR., DIRECTOR, DIVISION OF MILITARY APPLICATION; JOHN W. MACY, DIRECTOR OF PERSONNEL AND ORGANIZATION, SANTA FE OPERATIONS OFFICE, LOS ALAMOS; CARROLL L. WILSON, GENERAL MANAGER, AND JOSEPH VOLPE, JR., GENERAL COUNSEL, ALL OF THE UNITED STATES ATOMIC ENERGY COMMISSION**

Senator HICKENLOOPER. Mr. Tyler, do you have anything which you wanted to continue with on the housing situation that we left rather in the middle of yesterday?

Mr. TYLER. I have a couple of items to clear up, if I may.

Senator McMahon, you asked about the number of bids we had on this lodge situation.

The CHAIRMAN. Yes.

Mr. TYLER. There were three bidders on that program. The low bid, it was a combination project which included the lodge, the so-called Boy Scout building, the main-gate detachment, and a lot of roads and utilities in the same bid.

Senator HICKENLOOPER. Did that include tearing down the gift shop?

Mr. TYLER. No; that came in on the post-office bid, sir.

The low bid on the total was \$577,083. The second low bidder—

The CHAIRMAN. Who was that?

Mr. TYLER. Robert E. McKee.

The second low bid was by C. W. Via, at \$814,343. The third bidder did not submit a complete bid and his bid was rejected. That was Steinbeck & Cordner, who did that Kellogg-Manley house and went broke. They went broke shortly afterward. I am just as well pleased they did not get that one.

I would like, if I may, sir, to clear up for the record and, I think, for general information, my own status in this project. I so often end up before Appropriations Committees because I choose to appear myself in the status of the man who runs the town of Alamos.

I am assigned by the Commission to the Santa Fe Operations Office. That includes the laboratory and the town of Los Alamos. However, it includes eight other installations in which I have complete control or partial control. It includes the whole production program for weapons.

I receive my directives in considerable detail from the Washington office through the Director of Military Application; however, I am charged with the production of weapons. I think that possibly Senator Hickenlooper may have left the impression yesterday that Dr. Bradbury in the laboratory is charged with the production of weapons. He is not. He is director of the laboratory and is keenly concerned in the design of weapons and has a major interest in the production of nuclear parts of the weapons.

The remainder of the weapons, however, is constructed at other places and I would say that it involves contracts with some 1,400 different vendors in the United States, who make one part or another. That is the responsibility of the Commission. It is exercised by the Commission through my office and my staff.

Senator HICKENLOOPER. There is not a single part of the weapons or a single new design that does not pass through the O. K. of Dr. Bradbury; is there?

Mr. TYLER. Very definitely not. Dr. Bradbury is responsible for the design of weapons, and his laboratory. The production of weapons is the responsibility of the Commission and is executed by the Commission.

Senator HICKENLOOPER. Oh, yes.

Mr. TYLER. Now, I maintain my headquarters at Los Alamos at the desire of the Commission and, I think, wisely. The heart of the program is the Los Alamos laboratory. I take a great interest and a personal interest and probably interfere somewhat too much, perhaps, in the town of Los Alamos, because upon my arrival there a great deal of the low-morale condition and a great deal of the confusion in the laboratory and in the laboratory program stemmed from the town proper.

The town had been a military post that was constructed by the military in an economical manner to do a single job with no objective or no intention of having the town last. It was temporary construction, and the town was run as a military post. The stores were post exchanges and commissaries, and so forth. The people were in a considerable state of confusion.

In order to build the laboratory back up and build the morale of the laboratory and get the program functioning again, the program which the Commission had determined upon and which the country urgently needed, it was necessary to rebuild the town and build the morale of the people up in their own homes. We had to provide them with a community in which they could proudly live and bring up their children.

We do not borrow scientists in this program. We hire them with the hope that they will devote their full energy freely and with no reservation to this program; and in order to do that they must have a home in which they can live comfortably and peacefully, a home to which they can come and not find their wives complaining about the grocery store or the fact that somebody had told her to do this and she did not think she ought to—a home they can plan on and in which their children will be properly raised, schools which they can be proud of. I do not think scientists are a privileged class by any means, but there is no question but that scientists have standards of schooling which are high. Most of them come from universities and university towns, and one of the first questions which we are asked when we try to employ a scientist who has children is: How is the housing and how is the school? Then he goes around and wants to know how much money he is going to get.

For that reason I have devoted a considerable part of my time and the time of my staff building a town which I do not consider elaborate or extravagant or wasteful. I consider it a sound town in which anybody would be pleased and proud to live and in which people now as the result of a considerable effort on our part and on the part of the people—people are now paying their own way. They are being subsidized less and less all the time, and they are not kicking about subsidies or anything else. They are willing to pay their own way if they get something for their money, and I think we are giving them something for their money.

There have been instances, and I am perfectly willing to acknowledge any errors I have made—there have been instances in which I may have spent unwisely, but I will contend definitely that I have not spent extravagantly and I have not wasted funds. I have been unwise in some instances. I am perfectly willing to acknowledge it.

However, the last compilation I had of contracts, we had some 74 construction contracts which totaled around \$60,000,000. I feel that by the manner in which my staff has been organized and the direction in which we have worked to get all of our work into competitive bidding, into lump-sum construction, I have saved the Government many tens of thousands for every thousand dollars I have spent unwisely.

I certainly am open to criticism for spending unwisely and I would be very glad to go on and explain, but I do feel that in general we have conducted, with the full understanding and full support of the Commission, we have conducted a sound program there which is beginning to show results. The laboratory is working full time on their job.

They are not worrying about what is going on at home or in town any more. I think the program reflects that.

Thank you, sir.

Senator KNOWLAND. Referring back to the testimony yesterday on this group of houses that was in a state of collapse after a period of time, I notice on the mimeographed sheet which was passed out today, conclusions—I presume brief conclusions—of the Army engineers who investigated it to the effect that they found that the major deficiencies are improper roofing, overloading of structural members, especially sills, and the waiving of the moisture content of the lumber.

Mr. TYLER. Yes, sir.

Senator KNOWLAND. Frankly, that report was rendered on July 2, 1948.

Then, I notice that it was not until May 27, 1949, almost a year later, when the case was turned over to the Attorney General for possible damage claims against W. C. Kruger & Associates, architect-engineers for the original project.

My query is either to you or to the general manager, Mr. Wilson: In view of the very major deficiencies which were brought in the report to you dated July 2, 1948, why it would take almost a full year before the matter was submitted to the Attorney General for possible damage claims to protect the interests of—

Mr. TYLER. I would like to answer briefly about that, Senator Knowland, and then request Mr. Volpe, the legal counsel of the Commission, to go on with the answer.

Briefly, the impression has been received—

Senator HICKENLOOPER. Mr. Tyler, before you come to that—

Mr. TYLER. Yes, sir.

Senator HICKENLOOPER. May I ask the Senator if he will just read the next sentence in that report which is apropos of the architects where it says:

It is realized that the waiving of the moisture content was approved by higher authority and probably at the request of higher authority, but when this change was made it was the responsibility of the architect-engineer to check framing details and strengthen where necessary. It is also believed that the deficiencies listed above should have been observed and corrected by the inspection force.

Mr. TYLER. That is correct, sir. I am afraid the impression has been received, and I regret it, that in this group of 350 houses, 350 houses

fell down. That is naturally incorrect. The ceilings in one bedroom of a number of houses began to give away. As a matter of fact only two families had to move out of their houses during the repair periods. Only 27 families lost the use of one room of the 350 houses.

Senator HICKENLOOPER. I have a number of letters in my files, which I did not think were particularly appropriate for this hearing, in which people said they had no place to go and they had to stay there.

Mr. TYLER. That is not correct. We had to take care of all those who had to move. Most of them did not want to move; it was too much trouble.

Senator HICKENLOOPER. All I wanted to say is what these people said. I did not want to inject it into this hearing.

Mr. TYLER. It certainly is a privilege, and I think a privilege which is very valuable, for people to be able to write letters of that nature, and I certainly would not want to interfere, and I would be the last person who would think that they should not, but I will say, and I think it is to the credit of the Commission and the management, that those letters are getting fewer and fewer. They find that they can come down to my office and make a complaint and are treated properly and decently.

Senator HICKENLOOPER. Well, the only answer to that, I should say, is that you should see my files in the last 30 days, if you are saying that they are getting fewer and fewer.

Mr. TYLER. That will be very interesting. But the community as a whole knows that my office is open. They do not have to have an appointment; they can come down to my office, and they will be treated fairly, and they have been treated fairly, and the majority of them, I feel, have been treated that way.

However, in answer to the question: In the process of remodeling—that was our newest housing, and it was the best housing we had from the living point of view, and recognizing this deficiency which we went into and found out which was existing, this deficiency in all houses, we repaired all houses during the summer season.

Senator KNOWLAND. What was the total repair bill?

Mr. TYLER. The total repair bill of 350 houses was \$250,000. We did two jobs—we had a total bill of \$530,000—we went back and made changes in the houses which should have been put in the houses originally. I did not build those houses. They were built by the Manhattan Engineer District and were built in a hurry, and I feel that very definitely, and the people living in the houses had a very large number of logical complaints, and while we were doing the job we brought the houses into decent shape, but about \$250,000 was the price to take care of a deficiency in design and construction.

Senator KNOWLAND. I think we had that testimony fairly complete yesterday.

Mr. TYLER. Yes, sir.

Senator KNOWLAND. My particular point is why did almost a year go by between the time that the report indicated some very serious deficiencies on the part of those who were responsible for the design and the supervision of the construction of those houses and the ultimate action of the Commission on May 27, 1949, before the matter was turned over to the Attorney General, and whether there was any significance

between the date of May 27, 1949, and the date of May 22, 1949, when Senator Hickenlooper first made his charges publicly.

Mr. TYLER. Not as far as I know, sir. I have no knowledge of any such connection. I take the responsibility for the initial delay in that, sir, because I received the report—and incidentally, Senator McMahon, the board was composed of two members of the Army Engineer forces from El Paso and the engineer officer of the Los Alamos Scientific Laboratory, who had not been there during this time, and therefore, I felt could give an impartial assistance to the visiting members.

I read the report very carefully, sir, and consulted with my own attorneys and felt myself, and recommended to the Commission, that it would be unprofitable for the Government to attempt to recover on this project, to recover on this contract.

Senator KNOWLAND. When did you make that recommendation to the Commission?

Mr. TYLER. March 25. I received the report—I transmitted it on July 2.

Senator KNOWLAND. Now, wait a minute. What year are you talking about?

Mr. TYLER. 1948, sir.

Senator KNOWLAND. Well, the report was not made to you until July 2, 1948, so how could you have submitted your report to them in March?

Mr. TYLER. The report was submitted to me on the 25th of March, according to my records.

Senator KNOWLAND. 1948?

Mr. TYLER. 1948; yes, sir. I called the board on the 1st of March.

Senator KNOWLAND. I am quoting to you on what the Commission, through our committee staff, passed out this morning, but it says that the report of this engineering board was dated July 2, 1948.

Mr. TYLER. I think probably that was obtained from the Washington office and that was the date on which I transmitted the report to Washington.

Senator KNOWLAND. I see.

Mr. TYLER. The board was called by me and met on the 1st of March and submitted this report to me on the 25th of March. I transmitted the report to Washington on the 2d of July.

Senator KNOWLAND. So there was just a 4-month interval between the time you received your report and when you transmitted it to Washington?

Mr. TYLER. The 25th of March to the 2d of July, a little less than 4 months, yes, sir; because I had to go back and see if I could find anything further in the files to indicate what had been done and who had been responsible, who told the architect to do this, and so forth. The files are very incomplete, and for that reason I felt that it was unprofitable to try to recover on this because there was not enough facts in the files on which to base a prosecution soundly. I made that report to Washington.

Senator KNOWLAND. In other words, the Commission reversed your judgment and determined that there was sufficient bases?

Mr. TYLER. I would like to tell you, sir, through Mr. Volpe, sir, at this point, if I may.

**Mr. VOLPE.** When the report was received in Washington and was reviewed by us in Washington, we felt that the report was not sufficient. We felt there were additional facts which should be checked, and we recommended to Los Alamos that they conduct an additional investigation.

**Senator KNOWLAND.** When did you make that recommendation?

**Mr. VOLPE.** I do not have the date before me, but my recollection is that it was probably around September of 1948. I might say that even today—this is from the standpoint of recovery—there is quite a problem for this reason: The total record in this case will show that there was a great deal of confusion as to who was responsible for what. For example, the company was under the supervision and direction of the contracting officer, a colonel in the Manhattan Engineering District. In going back and trying to reconstruct what happened with respect to authorizations, trying to reconstruct what happened from the standpoint of authorization, it has been extremely difficult to determine the individual who finally passed upon a particular item.

For example, in connection with lumber, the facts that were developed were rather conflicting. Someone said that an Army officer had authorized the use of the lumber even though it was known at the time that the lumber was probably not dry and not suitable. The reason for that was that they had to get the houses built in order to get a roof over the heads of people in Los Alamos. Well, this is just to say that this was not an easy investigation to make in order to determine liability. It was sent back to Los Alamos, and they conducted additional investigations.

There was a good deal of correspondence and discussion back and forth, and it was not until early in March or perhaps April that we felt that we had probably exhausted all possible sources of information. We then presented to the general manager—that is, counsel presented to the general manager—the director of military application, and to Captain Tyler—counsel's views as to whether or not an attempt should be made to recover from this contractor the cost, the additional cost, to the Government. It was also recommended that before a final determination was made it would be referred to the Attorney General, and this was done in May of this year.

**Mr. TYLER.** May I add, Senator Hickenlooper, to that, that Mr. Kruger, the architect, has been associated with the project since 1942 or '43. I have a record here of the amount of work since I have been there, and it is in the beginning of 1946, '47, and '48. He is working on a lump-sum contract which is subject to negotiation upon the completion of his work. We converted his contract for managerial reasons on this last—

**Senator HICKENLOOPER.** Would you just repeat that again, please?

**Mr. TYLER.** He has operated in 1946, '47, and '48 on a series of three lump-sum contracts which are subject to negotiation for fee upon the completion of the work.

Last July, my engineers recommended strongly to me for engineering reasons that we change that to a cost-plus-fixed-fee contract, which we did. His work is just being completed on those other three contracts, just coming to an end, and within the last month, my engineer and my legal staff have been working with a c. p. a. from my Los Angeles office to recompute fees for those three contracts.

In devising the new contract we specifically said that that did not prevent us from recovering any damages or loss to the Government under the old contract.

I feel—I am not at liberty, I do not think, Senator—I have not discussed this with the architect nor with the legal staff here—to prognosticate what we will recover out of those three contracts, but the present indication is, I can say freely, that we will recover over \$100,000 from those contracts.

I am holding that in abeyance, because I am not sure whether that will prejudice the Attorney General's case or whether it will confuse it or not, and I will have to consult with the Washington office to see which is the better way of going at it.

Senator HICKENLOOPER. My record shows that January 1, 1947, to September 22, 1948, Kruger had received \$2,252,343.31 in architect fees.

Mr. TYLER. That may be correct in that he has received them, but some of them are recoverable under this negotiation.

Senator HICKENLOOPER. How much has he received since September 22, 1948?

Mr. TYLER. I do not know, sir, but I think I can cover the principle of this very clearly for you, if you will permit me.

In fiscal year 1948, Kruger was the architect-engineer for, and did the architect work and the inspection work on, \$31,000,000 worth of construction.

In the year 1949, his work, the scope of his work, was reduced and we obtained other architect-engineers, and he did the architect-engineer and the inspection work for \$14,496,000 worth of construction.

We have already made plans, our plans, for the fiscal year of 1950, and the Kruger Co. will be involved in architect-engineer work for only a total of \$8,971,000.

Senator HICKENLOOPER. Are those negotiated contracts?

Mr. TYLER. The construction contracts? No, sir, they are—

Senator HICKENLOOPER. Architectural.

Mr. TYLER. Architect; yes, sir. They are negotiated.

Senator HICKENLOOPER. They are negotiated, and they are not on bids?

Mr. TYLER. No, sir. I think you are aware, Senator Hickenlooper, that architect-engineers do not bid. They will sit down privately and negotiate with you, and they are very reluctant to have the fees shown, but they will not bid.

Senator HICKENLOOPER. Yes, I know that.

Mr. TYLER. When I came there we had two architect-engineers, Kruger involved in architectural work, and the Black & Veatch Co. of Kansas City involved in engineering work as engineering consultants on water lines, and so forth.

We now have six architect-engineers on the project.

Senator HICKENLOOPER. Do you know how many employees the Kruger Co. had on the average from January 1, 1947, to September 22, 1948?

Mr. TYLER. No, sir, I do not, because he does not keep his employees at Los Alamos. Most of his employees are at Santa Fe. One of the reasons, frankly, that we went to a cost-plus-fixed-fee type of contract last July—I did it reluctantly; I do not like that type of contract, but

my engineers requested it and made a pretty good argument for it—the Kruger work was becoming—was extending in such directions and being spread out throughout the area so far that under the lump-sum type of contract he could not afford to hire such inspectors, and if we went to a cost-plus-fixed-fee contract we could require that he hire, because we were reimbursing him for it, and we worked his fee on that basis.

What date did you ask, on the employment strength, sir? September?

Senator HICKENLOOPER. Well, the amount that I have here was brought up to September 22, 1948. The period is from January 1, 1947, to September 22, 1948.

Mr. TYLER. January 1947 he had an average of 47 employees and a peak of 84. In September 1948 there was an incremental increase here. In September 1948 he had an average of 153 employees.

Now, may I explain the fee situation here? You are aware of the manner in which we arrive at fees, I am sure. It is not generally known, but I do not dream up the fees; I do not sit down with a man and see how much I can get him for, and so forth. We use what we now have in the Atomic Energy Commission fee book, which establishes fees for different types of work, a top and a bottom, a perimeter in which we negotiate.

Previous to that we used the Corps of Engineers' fee book, which had been used at the Manhattan District and which is a widely recognized fee book.

We negotiate fees within the limits set by those books, and they are nationally sound fees, and are used by all Government departments in one form or another.

I believe the Atomic Energy Commission fee book, when it was finally put together and we started using it, was put together by the engineering group here in Washington after consultation with a number of Government departments who already had fee books, so I think it is a sound book.

But Kruger's fee, when it was a lump-sum type of thing averaged about 5 percent for both architect-engineer and inspection. His original one, he received 4.2 percent for the architect-engineer work and 2.1 percent for his inspection work. Those are not bad fees; these are consistent fees.

Then we negotiated him down in his other contracts, and now, under the cost-plus-fixed-fee contract, in which we reimburse him for his expenses, he is getting less than 1 percent. That is not a bad national average; in fact, it is a little less than the national average.

Then the Ralph Parsons engineer contract, which we just recently negotiated, his fee is almost exactly 1 percent. That is about the type of fee that we pay. We do not just decide that this man gets so much money. We negotiate fees, and I believe that investigation will reveal that our methods of negotiating fees are recognized in Government work and we have not used any unorthodox or unusual methods of arriving at fees.

Senator HICKENLOOPER. I do not want to, so far as I am concerned, continue with this. I am through talking about Kruger.

Mr. TYLER. All right, sir; I have nothing further.

Senator HICKENLOOPER. Mr. Tyler, when you went to Los Alamos about the middle of 1947—that is when you went there, did you not?

Mr. TYLER. I took over command there—well, I guess it is not command. I took charge there on the 17th.

Senator HICKENLOOPER. You had just left a command.

Mr. TYLER. Well, I mean, it is a phrase that I am in the habit of using.

Senator HICKENLOOPER. You came from the Navy?

Mr. TYLER. Yes, sir; I came from the Navy. I took over there on the 17th of July 1947.

Senator HICKENLOOPER. Yes. And at that time there was considerable confusion and uncertainty as to just what the future program would be, and it was not exactly a quiet or a reliable situation, was it?

Mr. TYLER. The Commission had expressed considerable concern as to the situation before I took over, sir.

Senator HICKENLOOPER. Well, I mean there had been a period of uncertainty when we did not know what kind of policy we were going to use toward atomic energy.

Mr. TYLER. That is right.

Senator HICKENLOOPER. And then the transition from Army operation into a civilian operation—

Mr. TYLER. Yes.

Senator HICKENLOOPER. And you did find some considerable degree of uncertainty and restlessness at that time. Is that not a fair statement?

Mr. TYLER. Yes, sir; I think that is a fair statement.

Senator HICKENLOOPER. And that was in the scientific personnel as well as other people around there?

Mr. TYLER. Those were the people I was mostly concerned with.

Senator HICKENLOOPER. Well, the scientific personnel composed that?

Mr. TYLER. Yes, sir.

Senator HICKENLOOPER. You began to bring order out of uncertainty there, I am sure; and after the program or our atomic energy policies of the country as fixed by the McMahon Act had become determined, you were able to try to go to work to straighten that situation out; is that true?

Mr. TYLER. That was determined before I arrived there, sir, but it gave us a groundwork on which to work; yes, sir.

Senator HICKENLOOPER. Yes.

Dr. Bradbury had been there before, had he not?

Mr. TYLER. Yes, sir. Dr. Bradbury came there, I believe, in 1944.

Senator HICKENLOOPER. And he is still there?

Mr. TYLER. Yes, sir; he is still there.

Senator HICKENLOOPER. Now, I think it is a fair statement to make—and if it is not, you correct me—that you did start in out there and that you began to orient the town situation and the living conditions and began to establish a degree of confidence and efficiency in that laboratory; is that not true?

Mr. TYLER. With the assistance of—I must give credit. With the assistance of the Commission. The Commission established a program—

Senator HICKENLOOPER. Yes; certainly.

Mr. TYLER. For the laboratory which they had not had.

Senator HICKENLOOPER. Certainly. But you were in direct charge on the ground there?

Mr. TYLER. Yes, sir.

Senator HICKENLOOPER. And the laboratory has increased steadily in efficiency and productivity?

Mr. TYLER. It has, definitely; yes, sir.

Senator HICKENLOOPER. And that increase in efficiency and productivity has been steady; has it not?

Mr. TYLER. It has; yes, sir.

Senator HICKENLOOPER. How many people do you have working for the University of California there at this time?

Mr. TYLER. There are 1,700 at Los Alamos working for the University of California.

Senator HICKENLOOPER. Do you think, as a result of town operations and getting more reliable and satisfactory living conditions and a more reliable and satisfactory program in effect, that morale has steadily increased?

Mr. TYLER. I feel it has, myself, but I am not an expert on morale. I say it has increased, because the laboratory is producing.

Senator HICKENLOOPER. Yes; that has been a steady growth since 1947?

Mr. TYLER. The production of the laboratory has improved steadily since 1947.

Senator HICKENLOOPER. Yes; and do you not feel that the people have increasingly been more satisfied and more content to live there and work there?

Mr. TYLER. I do not get as many gripes as I used to, and we have very few separations.

Senator HICKENLOOPER. Yes. In other words, it has become, as a result of these activities, again a functioning operation to a satisfactory degree. Would you say that?

Mr. TYLER. I do not think I could say that as well as Dr. Oppenheimer said it in earlier testimony to your committee, sir.

Senator HICKENLOOPER. Well, I am just asking for your opinion, and you are a layman as far as being a scientist is concerned.

Mr. TYLER. I definitely am not a scientist.

Senator HICKENLOOPER. Yes.

Mr. TYLER. For what it is worth, sir, I think that the operation has increased and is making progress continually.

Senator HICKENLOOPER. Yes.

Mr. TYLER. It has not increased to the extent that it is going to, I am sure, under Dr. Bradbury's leadership.

Senator HICKENLOOPER. What was the number of the University of California people who were there?

Mr. TYLER. 1,700, sir.

Senator HICKENLOOPER. 1,700? For the sake of brevity, I would like to refer to some of these hearings that we had this spring. I find, Mr. Tyler, on page 1150 of the hearings with respect to the independent-offices appropriation bill for 1950 of the House of Representatives, a statement that is in conflict, a statement that you made before that committee, and I am sure it was an oversight, but I would like to get it straightened out.

At the bottom of the page, you say as follows, in answer to a question of Mr. Thomas:

The University of California, I might say, will have increased last November 1,554 to 2,200 in 2 years. That will be the increase in the laboratory personnel.

Now, on page 1151, you say :

The University of California had, as of January 1, 1957.

Now, I am taking no issue with your statement there except that I think it is a statement which was probably not clarified, and I want to know whether that 2,200 that you refer to is an anticipated number or just what the fact was, and that was the reason I asked you about the present number.

Mr. TYLER. Well, yes, sir. The numbers are bound to be somewhat confusing there because in some cases they refer to the University of California at Los Alamos, and the others refer to the University of California contract, which also includes Sandia. The University of California runs the Sandia Laboratory, which is right next door at Albuquerque, and it is under Dr. Bradbury's control.

In my charge, I have University of California employees as of now 3,300 total employment. They are not at Los Alamos; they are at Los Alamos and Sandia.

Senator HICKENLOOPER. Yes, but there are approximately 1,700—

Mr. TYLER. At Los Alamos.

Senator HICKENLOOPER. Living and working at Los Alamos. That is correct; is it not?

Mr. TYLER. Yes, sir, and the prospects are within the year it will increase to 2,000. They are endeavoring to recruit additional personnel now, as soon as we can find places for them to live and work, in view of the increased program.

Senator HICKENLOOPER. Now, with regard to the accounting system at Los Alamos, if you will turn to page 1148 of that record, if you have it—

Mr. TYLER. I do not have it, sir.

Senator HICKENLOOPER (continuing). A statement is made by you, as I read it here, as follows:

Last year before your committee—  
that is, the House committee—

I made a rather impassioned and undocumented appeal to leave me alone for another year and I would give you some costs. I did not have them last year, and in the intervening time I naturally have done my best. I would like to have another 3 months to consolidate my figures, but due to your efficiency I did not have the extra time. However, we have sound figures, and in the intervening period we have put in an adequate cost-accounting system so that we know where the money is going, where it had been wasted, and how to correct it.

Now, Mr. Thomas then says:

Mr. Tyler, if you have all that good system in there—no doubt you have—you did not put it down in this justification, because it is not here at any place.

Mr. TYLER. It is not here, sir.

Now, you later said on page 1150, after the insertion of some tables:

Mr. TYLER. Yes, sir. It is not in here. When this was written the system was not in effect. We got the accounting system started as of the 1st of July.

Could you explain that? I mean, is there an accounting system new and in effect at Los Alamos now?

Mr. TYLER. Yes, sir. The accounting system is in effect. It is working and it is paying dividends.

Senator HICKENLOOPER. When was it put into effect?

Mr. TYLER. It was put into operation—we first changed the books and started the system in July of 1948.

Senator HICKENLOOPER. Of last year?

Mr. TYLER. It was of very little value to us for the first 3 or 4 months. It was a new system. We had to actually get the accountants who helped set it up—back to pull some of the bugs out of it—because it is rather a complicated set-up.

As of the 1st of January, I would say rather definitely it was paying dividends. I had in January, March, and April a monthly operating statement with which I would work. It was a management statement. Previously we did not have that type of thing.

Senator HICKENLOOPER. You had various management surveys and accounting surveys there in Los Alamos; did you not?

Mr. TYLER. In the late fall of 1947 and the early spring of 1948.

Senator HICKENLOOPER. Yes. Do you know what the total costs were of those surveys?

Mr. TYLER. Of all the surveys, the total costs were \$230,000. That included the management survey which I instituted, and the accountant survey which was instituted by the Commission in Washington.

Senator HICKENLOOPER. Yes.

Now, then, I would like to talk about the Zia Co. contract. The Zia Co. is the town operating company—is it not?—that takes care of the management of the town and its operation.

Mr. TYLER. No, sir.

Senator HICKENLOOPER. What is the Zia Co.?

Mr. TYLER. I feel this is very important and that it must be cleared up. Again at the appropriation hearings, and things of that nature, I invariably end up with the same impression that Zia is there to run a town.

Zia is the operating contractor for the whole project. The University of California, unlike G. E. at Hanford, or the Carbon & Carbide Co. at Oak Ridge, the University of California does not operate and maintain and run the laboratory. They staff the laboratory and do the technical work. The Commission is responsible for the structures and the buildings and the maintenance and the steam and the heat and the repairs and so forth, and we do that through the Zia corporation.

They maintain and operate all facilities of the whole 65,000 acres, roads, steam plants, electric plants, water wells, and so forth, as well as the maintenance of the real estate in the town which is only—roughly as of this year, 50 percent of their dollar volume of business is done in projects other than in the town.

Senator HICKENLOOPER. Yes; but the Zia Co. is a corporation which was formed there for this purpose that you have outlined.

Mr. TYLER. Yes, sir.

Senator HICKENLOOPER. The Zia Co. is really an offshoot of the McKee Construction Co.; is it not?

Mr. TYLER. Mr. McKee owns the majority stock in the corporation, and most of the stockholders are former McKee employees who are now working for Zia.

Senator HICKENLOOPER. I believe his son is president—is he not?—of the corporation.

Mr. TYLER. No, sir; he is the president of the corporation.

Senator HICKENLOOPER. Mr. McKee is?

Mr. TYLER. Yes, sir. His son is the project manager at Los Alamos.

Senator HICKENLOOPER. Yes. The McKee Construction Co. was the company that built most of Los Alamos?

Mr. TYLER. That was the company that was there during most of the war.

May I amplify that a little bit for the record?

Senator HICKENLOOPER. Yes.

Mr. TYLER. I was not there at the time, and I searched the records to find as much information as I could and made a number of inquiries.

The Army engineers used to do this work themselves with enlisted men and a number of contract employees, who they hired individually.

When the Army engineers saw that they were going out of Los Alamos, and the Commission was coming in, they recognized that some permanent set-up had to be made to insure the continuation of the maintenance and the operation; and, as I understand it, they searched that part of the field to try to find somebody who would do that, and they received no help from anybody. In fact, most of of the people wanted nothing to do with it, and it is also my understanding—and I have confirmed this with the elder Mr. McKee in conversation—that he was approached by the Manhattan Engineer District and asked if he would undertake to supply an organization to maintain and operate the project, and he said that he would.

He formed a corporation; he staffed it, naturally, I would say, out of people whom he knew. They were mostly construction people and not maintenance people.

We have had trouble with that in getting them back into a decent lay-out, but it was done, not at his suggestion but at the request of the Manhattan Engineer District, and I can say that except for the corporate structure and stockholding, and so forth, that the Zia Co. and the McKee Co. are two complete and separate concerns, and I can say that advisedly because I have watched projects which the McKee Co. were low bidders on, and in which the Zia Co. was going to occupy—well, they might easily not even be members of the same family because they fight rather bitterly about the construction work.

I am satisfied in my own mind, sir, that the relationship, the fact that Mr. McKee is a construction contractor and owns stock in the Zia Co. has nothing to do with it.

Senator HICKENLOOPER. I have not raised any criticism, but I was just curious.

Mr. TYLER. Well, it is a fact.

Senator HICKENLOOPER. How many employees does the Zia Co. have there at Los Alamos?

Mr. TYLER. Let me get you the exact figure, sir; 2,412, sir.

Senator HICKENLOOPER. At this time?

Mr. TYLER. At this time; yes, sir.

Senator HICKENLOOPER. How many of them work in the maintenance of structures within the restricted area, that is, as separate from the town operations?

Mr. TYLER. There are 600 permanently stationed in that area, that is, they do nothing but that. A great many of the others work in there at intervals when jobs which are in their specialty come in, but there are 600 who stay in that area and are under one superintendent and do nothing but that.

Senator HICKENLOOPER. How many are assigned to what might be called the town management and town maintenance?

Mr. TYLER. That is not a clear figure, sir. I have, for instance, an electrical shop and electricians. The electricians sometimes work in a house, sometimes they are working in a garage, sometimes they are working in the transportation division, and sometimes they have to go over and assist the people in the laboratory. We do not divide them between town and county, and so forth. We maintain the shops.

Senator HICKENLOOPER. I was prompted on that question by your statement on page 1151 of the hearings to which I have referred as follows:

Mr. TYLER. Well, Zia, for operation and maintenance work, has 2,643 at the present time.

I understand that is 2,400 now.

Mr. TYLER. Yes, sir.

Senator HICKENLOOPER. This states:

Zia, for operation and maintenance work, has 2,643 at the present time and breaks down into 1,520 in town, 810 in the laboratory, and 313 in the operation of the schools and the hospitals.

Mr. TYLER. That at that time was a general break-down, sir.

Senator HICKENLOOPER. Can you give me a general break-down at this time?

Mr. TYLER. No, sir, I cannot because we do not operate that way any more.

Senator HICKENLOOPER. Have you changed your system?

Mr. TYLER. We are trying to get the operation of the shops as such.

Senator HICKENLOOPER. Have you changed your system?

Mr. TYLER. We have changed the Zia system rather completely.

Senator HICKENLOOPER. I was wondering why you were specific there and you cannot be specific at this time?

Mr. TYLER. Well, I can give you a break-down here, sir, which covers some of the different departments. I will have to pick my numbers over rather clearly.

In the Safety Division—I am picking out of a small-scale chart—

Senator HICKENLOOPER. Can you break them down, as you did in the appropriations hearing?

Mr. TYLER. That was a rather arbitrary break-down, and we do not operate that way at this time. We do not have a group who do nothing but town. We cannot have a group who do nothing but town. It would be an inefficient operation; I would have to maintain an electrical shop for the town, an electrical shop for the laboratory, and an electrical shop for somebody else. We have one shop. We have spent a great deal of time and effort as a result of this management survey in reorganizing the Zia Co. on an efficient basis. They have gone down since last September from some 3,700 employees to this 2,400.

The project has not suffered. We are getting better utilization of employees; we are getting a better distribution of work. I can give you the break-down by the divisions of the Zia Co.—maintenance, transportation, property, fiscal, and administrative, and so forth—if that is of any value to you, sir. Again, I would like to emphasize, Senator, that the town does not stand out as a town. There are 65,000

acres of it, and it includes all public utilities as well as the real estate operation.

Senator HICKENLOOPER. Yes; I understand that.

Mr. TYLER. It is not comparable to a town operation.

Senator HICKENLOOPER. How many do you have operating the schools, the schools and hospitals?

Mr. TYLER. We have a total of—this is the third quarter of 1949—67 teachers in the school who are on the Zia pay roll.

Senator HICKENLOOPER. Sixty-seven teachers?

Mr. TYLER. Yes, sir.

Senator HICKENLOOPER. Who are these 313 that you mentioned this spring? They—

Mr. TYLER. Where is the hospital?

There are 178 people involved in the operation of the hospital.

Senator HICKENLOOPER. Do you have any school janitors or anything of that kind?

Mr. TYLER. Yes, sir; but they do not stand out separately. They come under the janitorial system, and I do not know how many there are. We have changed that system recently also.

Senator HICKENLOOPER. When did you change it? I am trying to fix the reason why you had specific break-downs this spring, and you do not have specific break-downs now.

Mr. TYLER. Because, as I say, it is a different type of operation than it was. It does not stand out clearly.

Senator HICKENLOOPER. Am I to understand that you had a system that you could break down this spring, and you now have one of confusion that you cannot break down?

Mr. TYLER. No; it is quite the opposite, sir. That was the condition of confusion before in which we arbitrarily pulled—and said that this many are running the town.

Now, I know where the people are, but they are not assigned to the town as a town. They are assigned to their own job. They are assigned to the electrical shop or the transportation division, to the power plant, and things of that nature.

The power plant supplies power for the town. It supplies power for all of the outlying sites, the majority of them, and it supplies power for the laboratory, and it is very difficult to say how many of the people in the power plant supply power for the town.

Senator HICKENLOOPER. Well, I am not trying to be that technical.

Mr. TYLER. I am sure you are not, sir.

Senator HICKENLOOPER. But manifestly there are certain of these maintenance people who devote all of their time or the big majority of their time within the restricted area.

Mr. TYLER. Well, I gave you that figure, sir. There are 600 who spend all of their time within the restricted area.

Senator HICKENLOOPER. Within the restricted area?

Mr. TYLER. Yes, sir.

Senator HICKENLOOPER. And, generally speaking, that would correspond roughly with the reduction in force, with 810 in the laboratory, as you testified to this spring?

Mr. TYLER. Yes, sir; roughly.

Senator HICKENLOOPER. Now, then, about 240-some, including 67 teachers and 178 in the hospital, the 240-some in the schools and hos-

pitals in those categories, that might have some relationship to the 313 in the operation of the schools and hospitals as testified to this year?

Mr. TYLER. That is a comparable figure; yes, sir.

Senator HICKENLOOPER. I presume there are some janitors?

Mr. TYLER. There are a few; yes, sir.

Senator HICKENLOOPER. Your statement earlier this year in this appropriations hearing that I have is, "1,520 in the town." I take it that it would be town street maintenance, repairs, and the electricity, electric-light plants, the water works, and whatever operation there is, the gas installations you have, and things of that sort, electricians to take care of trouble?

Mr. TYLER. Yes, sir.

Senator HICKENLOOPER. Streets?

Mr. TYLER. I think the expression there is another reason that I endeavored to clear up when I started. I always end up with Zia as a town operator. The word "town" in that case is actually what is left after you take out the hospital and the schools and the people who spend all their time in the laboratory. That is all the rest of the operation which, as I say, is town, but is also power plants and water works which supply both the laboratory and the town and also people who operate some 33 outlying sites.

Senator HICKENLOOPER. I certainly understand that.

Now, there are residents there, resident workers there on the hill at Los Alamos, approximately 1,700 for the University of California, and about 2,400 Zia?

Mr. TYLER. Not residents, no, sir.

Senator HICKENLOOPER. Zia people are not residents?

Mr. TYLER. A great many of them are not residents. We have probably 2,000—I cannot state the figure exactly—we have over 2,000 people on our waiting list for housing who are employed at the project at the present time.

Senator HICKENLOOPER. How many houses and dwelling units do you have at the present time? That is, break it down, how many houses do you have, first?

Mr. TYLER. We have 2,100 houses, sir.

Senator HICKENLOOPER. 2,100 houses?

Mr. TYLER. This last figure here is the 1st of March, sir. We had 2,075 housing units.

Senator HICKENLOOPER. As of March 1?

Mr. TYLER. Yes, as of March 1.

Senator HICKENLOOPER. Does that include apartments?

Mr. TYLER. Yes, sir; that includes apartments.

Senator HICKENLOOPER. Do you know how many houses you have, that is, single-dwelling houses?

Mr. TYLER. These I would call family-type units because with rare exceptions only families are given houses or apartments.

Senator HICKENLOOPER. How many rooms do you have available?

Mr. TYLER. We have a total of—

Senator HICKENLOOPER. For single people?

Mr. TYLER. We have 1,333 dormitory rooms as of the 1st of March.

Senator HICKENLOOPER. And the 2,100 include houses and apartments?

Mr. TYLER. Houses and apartments; yes, sir.

Senator HICKENLOOPER. What is your total population on the hill there, that is, by that I mean resident population?

Mr. TYLER. The last count that we had, we have no means of taking a sound census—we take it by way of our school children, who do it for us—the last count that we had was approximately 8,600.

Senator HICKENLOOPER. Eight thousand six hundred people resident on the hill?

Mr. TYLER. Yes, sir. That was our last census which, as I say, was done by the school children for us.

Senator HICKENLOOPER. So, of all the people employed on the hill there at Los Alamos, it would figure out—I have not figured it exactly, but it would figure out some 30 or 35 percent of all of them work for the Zia Corp. I arrived at that figure as follows: 1,700 working for the University of California; 2,400 for Zia, and that is a total of 4,100 people working on the hill.

Mr. TYLER. I have those figures here, sir. You have neglected the AEC population.

Senator HICKENLOOPER. How many do they have?

Mr. TYLER. I have figures here as of April 1, sir, and there are 2,199 directly employed by the Zia Co.; there are 311 others employed by the Zia Co. to operate the hospital and the schools; there are 383 people who are employed by the concessionaires running the stores, and so forth.

Senator HICKENLOOPER. 383?

Mr. TYLER. 383; yes, sir. There are 2,039 people employed up there in construction who do not live on the hill, other than a few inspectors and superintendents. There are 1,069 employees of the Atomic Energy Commission.

Senator HICKENLOOPER. 1,069?

Mr. TYLER. And at this time, April 1, 1949, 1,741 employees of the University of California. This is at Los Alamos, and it gives a total of 7,742.

Senator HICKENLOOPER. 7,742?

Mr. TYLER. Yes, sir.

Senator HICKENLOOPER. Does that include the construction people?

Mr. TYLER. That includes the construction people. Those are people who are employed.

Senator HICKENLOOPER. How many of them are construction people?

Mr. TYLER. Two thousand and thirty-nine.

Senator HICKENLOOPER. Two thousand and thirty-nine?

Mr. TYLER. Yes, sir.

Senator HICKENLOOPER. That would leave 5,700 people roughly, because I believe those construction people do not live on the hill.

Mr. TYLER. Very few of them. I mean a few inspectors.

Senator HICKENLOOPER. Roughly, 5,700 people are working and living on the hill?

Mr. TYLER. They are working on the hill, sir, but they are not living there. I do not know the exact number of the employees who actually live on the hill because I do not have records here. I could find out for you exactly how many of them are living there, but the janitors, as a rule, do not live on the hill. Most of the common labor does not live up there, because they are pretty fluctuating.

Our common laborers are, to a large extent, Spanish-Americans from the surrounding communities; a considerable number of them are of

the various Indian tribes who come from the pueblos down at the foot of the hill, and that neighborhood. They prefer to live at home, and actually we do not have the type of accommodation yet available up there which they can afford to pay for at their rate of pay. They prefer to live in their pueblos.

Senator HICKENLOOPER. Leaving out the construction workers who are purely temporary on construction, who live off the hill, it leaves a total of 5,700, and if you subtract from that these laborers who come in and live some place else, assuming that there would be roughly 5,000 working people who lived on the hill, some of them, a great many of them, having families—I realize that—which increases the population. The point I want to make is that at least 50 percent of that entire number work for the Zia Co. in that neighborhood, and that for a town of that size, somewhere in the neighborhood of 1,500 people are on what might be called the municipal pay roll. I am leaving out the people who work in the laboratories and the people who work in the schools. If we added those, there would be at least 300 more. It would seem to me that is a pretty heavy load for any municipality to bear in relation to its population, and for street maintenance and water-works and things of that kind.

Mr. TYLER. Well, Senator, I would like to try to express an answer to that as well as I can, sir. I have tried this a number of times. This comes up very frequently, "That is an awful lot of people to run a town."

Of course, I have emphasized that that is not a town; and that apparently did not get across very well.

Senator HICKENLOOPER. It has paved streets, it has curbs, it has sidewalks, it has repair work to be done, and it has utilities to maintain, and to that extent it is a town, and it was my impression that it has been created into a livable town where people enjoy comfortable living and where every attempt has been made to convert it into a town, into a normal community.

Mr. TYLER. This is a town there, yes, sir; but the comparison is not easily apparent. I would not expect, and I have said frequently myself—if I worked in a town of 8,000 people, I would not expect to find 1,500 people employed in maintenance and operation. They are not a town. They operate, as I explained, a great percentage of the facilities, all the facilities and utilities which are used by this large factory.

The 600 people who are in the laboratory are there for repair, maintenance, and operation work. However, the utilities for that factory, the power, specifically, the water, the steam, the sewerage, and so forth, are all operated by the Zia Co. for the factory and the town, and then I might add to that, we have 33 outlying sites spread around this 65,000 acres, and the maintenance and operation of those and the utilities that go with them are the responsibilities of the Zia Co.

Senator HICKENLOOPER. What do you mean by outlying sites?

Mr. TYLER. I can only explain them in this way.

Senator HICKENLOOPER. Within 2 or 3 miles?

Mr. TYLER. They are within the 65,000-acre project, and they are spread pretty well around in there.

Senator HICKENLOOPER. Let us get down to the Zia Corp.'s activities. All of the expenses of the Zia Corp., including the salaries of all of these people are reimbursable by the Government, are they not?

Mr. TYLER. Yes, sir; they are.

Senator HICKENLOOPER. So that everything the Zia Corp. spends by way of salary or equipment or supplies there is reimbursable by the Government.

Mr. TYLER. That is correct, sir.

Senator HICKENLOOPER. In addition to that, you pay them on top of all of that, you pay to the Zia Corp. \$17,000 a month, do you not?

Mr. TYLER. For the fiscal year 1949; yes, sir.

Senator HICKENLOOPER. And that has been—that was paid for 1948, was it not?

Mr. TYLER. It was something more than that—1948, I believe.

Senator HICKENLOOPER. About \$18,000 for 1948?

Mr. TYLER. Somewhere in that vicinity.

Senator HICKENLOOPER. How do you justify what amounts to apparently a carte blanche operation with numbers of people and equipment fully reimbursable by the Government in every particular, including salaries and wages, how do you justify \$17,000 a month, a lump sum, or \$216,000 a year, in that neighborhood, on top of all those things to the corporation?

Mr. TYLER. I would like to go back to my earlier statement, sir, about cost-plus-fixed-fee contracts. The fee for the Zia Corp. is negotiated just as all other cost-plus-fixed-fee contract fees are negotiated. We have used the fee book on the management problem. It is not as clear on management as it is sometimes on A-E or as it is on construction, but it is clear, and the fees are fair and appropriate on that basis.

Now, in computing last year's fees—that was the first time that I was involved with that—and under the new 3-year-type contract which we have built with them, we are permitted under the fee manual, under the fee book, to set valuations on the efficiency of the operation.

I would like to say that in a town operation part of the Zia facility, that is, that type of thing, we gave them credit for only 46 percent efficiency, and they got only 46 percent of the allowable fee under the fee-management set-up.

Now, of course, I am sure that you will recognize that a corporation set up as a corporation with stock is in business to make money. They are not going to do it for nothing and because some of the people who are working for the Zia Corp. may or may not be stockholders does not prevent the corporation from still expecting to be paid for what it is doing.

Senator HICKENLOOPER. That is true. May I correct the figure I gave? Instead of \$216,000, it should be \$204,000. If it were \$18,000, I guess it would be \$12,000 more.

But the point is this, Mr. Tyler: The Government reimburses everything that the Zia Corp. does. It pays all the salaries; it pays all the wages; it pays all the expenses for all the equipment, and then dumps into the Zia Corp. at least under the present arrangement \$204,000 on top of that.

If the Government pays everything anyway, if the Government is responsible for all the expenses, why does not the Government run the situation or why does not the AEC put somebody in there who is skilled to do that and save the taxpayers \$204,000 a year on that situation? That is incredible to me, if I may use the term.

Mr. TYLER. Well, I hate to make generalizations, sir, but let me give you an example: I am reasonably certain, although I cannot specifically name it, but I am reasonably certain in the operation of a housing project which is owned and built and run by, let us say, an insurance company which builds a group of a thousand houses, they hire a man to maintain and operate that, and they pay him a profit. They do not try to do it themselves and save the difference. They hire people who are competent to do it, and they pay them a profit.

The CHAIRMAN. Is this comparable to a profit secured in the cases that you are talking about?

Mr. TYLER. I feel frankly, sir, and I have a number of figures, but they are not available, and I have gone into it—I may say this: This profit is very low for the amount of work they do.

The CHAIRMAN. But they were only 46 percent efficient.

Mr. TYLER. That was the efficiency we permitted them under last year's contract; that is all we were paying.

The CHAIRMAN. If they were 100 percent efficient they would have got pretty close to \$500,000?

Mr. TYLER. That is right. I did not dream up these figures; I got these out of a fee book. I did not say this was a good way of doing business. I used a standard fee-book method of computation, and sat down with them.

Senator HICKENLOOPER. Well, Mr. Tyler, in your staff at Los Alamos, you checked the operations of the Zia Co. and what they spend for reimbursement purposes, do you not?

Mr. TYLER. Very definitely, sir. I checked them also from the management point of view.

Senator HICKENLOOPER. I mean your staff—I do not expect that you check every dollar.

Mr. TYLER. No; my fiscal division checks it, sir. They have to do it.

Senator HICKENLOOPER. Your division undertakes to say whether the Zia Co. has properly spent this amount, does it not, before you reimburse them?

Mr. TYLER. Very definitely, sir. That is not a very good statement. We insure that they are doing the jobs we want as economically as they can.

The General Accounting Office decides whether or not they will be reimbursed.

Senator HICKENLOOPER. Yes; I understand. You pass on their efficiency?

Mr. TYLER. Yes.

Senator HICKENLOOPER. And you pass on the wisdom or the judgment with which they are operating this thing?

Mr. TYLER. Yes.

Senator HICKENLOOPER. Is that not true?

Mr. TYLER. Oh, yes.

Senator HICKENLOOPER. And you check these things very thoroughly before you reimburse them or you recommend that it be passed for reimbursement by the General Accounting Office?

Mr. TYLER. My fiscal division does; yes, sir.

Senator HICKENLOOPER. You have capable people checking these people, have you not?

Mr. TYLER. The fiscal people are capable fiscal people.

Senator HICKENLOOPER. Yes.

Mr. TYLER. I only have one man on my staff who checks their operations.

Senator HICKENLOOPER. Well, he is a capable man; is he not?

Mr. TYLER. He is a very capable man.

Senator HICKENLOOPER. Why do you not do it yourself? You are doing all the checking; you are assuming all the responsibility for recommending reimbursement. Why do you not do it with your own organization? Why spend \$204,000 a year on top of that if you have the responsibility? If you check it and if you O. K. it and if you pass on whether or not they are doing an efficient job, why spend that \$204,000?

Mr. VOLPE. Mr. Chairman—

Senator HICKENLOOPER. I am asking Mr. Tyler.

Mr. VOLPE. Well, I simply wanted to say this, Senator—

Senator HICKENLOOPER. Will you please let Mr. Tyler answer the question, Mr. Volpe?

Mr. VOLPE. Very good, sir.

Senator HICKENLOOPER. I will be glad to give you an opportunity in just a moment.

Mr. TYLER. I have operated a couple of other plants in my time, both of which were operated and run by employees of the Government.

We did not hire somebody to do it. I have some knowledge of that type of operation—rather limited, perhaps. I do not say that it is not a good type of operation, but it involves a great many headaches which a contract operation does not involve.

I do not have to worry as to whether he can hire competent engineers or whether he can fire competent engineers. He runs his own organization, and I get the results out of it that I want.

I would have to have personnel to hire, fire, and handle it—I would end up with a very similar type of set-up.

Now, we have studied—frankly, when I first came there I had the same thought: Why do we not have a direct operation at Los Alamos? Well, the first thing that I had to do, and I think it is sound to have done it in any case, was to find out what kind of an operation I needed, and that obviously was not it.

So, I had to clean house in the Zia Co. before I could go out and hire a bunch of Government employees to replace them. If I had hired 3,100 people which the Zia Co. had, I would have had too many and it would not have been a good operation.

We are cleaning that up and getting the operation into decent shape. At the same time, my personnel and organization office are spending a great deal of time with my office and the Zia office, and are actually documenting the results of a Government operation to find out whether we can do it as efficient and as cheaply to the Government, or whether we cannot. It is a very simple thing, sir, and many people have told me the same thing, to just say "Why don't you hire them and then you won't have to pay them the profit?"

I do not know what the full implications of this are until I have had full opportunity to examine it. I certainly could not turn it over overnight. I mean the town has to be run in an orderly manner, and it has to be run when and as we chose to do it, but as an example, sir, the Zia Co. allows 15 days a year leave.

If I employed, hired Government employees, I would allow 26 days a year leave, and I would further allow, I believe, 15 days sick leave.

That would require that I have a considerably larger number of employees in order to keep the same number working all the time.

The Zia Co. pays no retirement funds; they pay nothing of that nature. The Government would have to pay enough to pay retirement, and obligate itself for retirement of all of its employees. I do not say that those are not good things, but they are two or three of the things that immediately come to light when you try to compare a Government operation as a direct operation, with a contractor operation.

Now, I have had presented to me by some of my more enthusiastic staff members, who jump at things a little quickly, figures which indicated that it would cost us more in dollars and cents to run this project under Government direct operation. I have not accepted those figures. I want them better documented than I have had them, and I want a sounder understanding.

I have no objection to a Government operation, but I want to be sure that the Government is saving money, and that the Government is also getting a good operation out of it, and I could not even begin to do it with Government employees until I get this one straight, and I know what is right and what is needed.

Having got that, as I say, we are definitely studying, at your suggestion previously, sir, and at the suggestion of the Appropriations Committee, we are definitely studying a Government type of operation; and if and when it develops that it is cheaper or would be simpler, I certainly would be delighted to do it. But we have a problem there now also which would make a Government operation very difficult. Nobody hires Government employees in an outlying site unless they can provide housing for them. I could not guarantee all those people housing.

It is customary, and people do not come to an outlying site like that in a Government employment without housing.

Senator HICKENLOOPER. They come on private employment, apparently, without a house?

Mr. TYLER. Yes; and they get paid that way. Further, I am paying to the Zia Co., by necessity, not by choice, I assure you, construction wages, with various types of construction going on there, running, I would say, offhand, around \$5,000,000 a month.

If a man does not get paid by the Zia Co. the same rate of pay that he gets paid by the ABC construction company across the street, he is going across the street and going to work for the ABC construction company, so I have to pay construction type of wages, which is a high scale of wages.

I will always have to pay that type of wages as long as there is construction going on there, A, B, as long as I cannot provide housing. If I could provide that man with a house to live in on the site, and he did not have to travel 50 miles a day, he would be willing to work 52 weeks a year for less money, but as long as I cannot provide him a house he is going to go where he can get the most money.

Senator HICKENLOOPER. Well, that has been a long-time source of restlessness with me, this lump-sum payment on top of an operation of this kind such as the Zia Co. gets.

Mr. TYLER. May I give you another example?

Senator HICKENLOOPER. Yes.

Mr. TYLER. During last year's operation we have cut out a considerable amount of this, but during last year's operation the Zia Co. itself did architect-engineer services on a volume of \$3,000,000 worth of construction. One percent, which is a standard fee for an architect-engineer on a cost-plus-fixed-fee fund, 1 percent of that would have been \$30,000 there. That is only one item of their work; but if we paid an architect-engineer to do that, we would have had to pay him \$30,000, which services we got from Zia. They did the inspection work on \$1,200,000 worth of construction, and on the same basis of a fee we would have had to again pay them, roughly, \$12,000 for that. That is over and above all of their operation of the technical facilities and utilities, and so forth.

If we had to employ an architect-engineer to do those things, we would have been down another \$42,000, and Zia did that. You could, with logic, subtract that from their fee and say they did the town work and the laboratory work for the difference. They did \$7,300,000 worth of procurement for us; on most of our operating fees we pay a percentage of the total volume of procurement to the operator for his bookkeeping and his efforts, and the personnel that he has to work in there for procurement. If we take just that procurement off, we used up another piece of their fee.

Senator HICKENLOOPER. Well, is he not supposed to get the materials to operate this city, and does not the Government reimburse him for those?

Mr. TYLER. Yes, but, as I say—

Senator HICKENLOOPER. Does not the Government reimburse him for the salaries and the wages of the people who do that procurement?

Mr. TYLER. Well, we reimburse, let us say, the Ralph Parsons Co., which is an architect-engineer, for all their expenses, and we pay them 1 percent of the total volume of construction work as their fee.

Senator HICKENLOOPER. Mr. Chairman, I would like to just go on to one other matter here to get this closed up at this time, because it is approaching 1 o'clock.

The CHAIRMAN. Can I make one observation?

Senator HICKENLOOPER. Yes.

The CHAIRMAN. If you have a good claim—apparently you have because you have sent it to the Attorney General's office—against Kruger & Associates for \$250,000 and now you have him in line for the supervision of \$8,000,000 worth of work in the coming year, well, I would kick him out of there.

Mr. TYLER. That is a logical assumption, sir, but it has not yet been proven to my satisfaction that this fault can be laid to Kruger's door. It is still questionable.

In addition to that there is such a small part of the construction work, we will say, supervised there—I gave you the figures recently—in this period of time, that an error in that particular thing, aided and abetted probably by the engineers who erected the project, and by the engineers who inspected it, I feel do not damn him as an incompetent architect in my mind.

The CHAIRMAN. Do you think he is competent?

Mr. TYLER. I think he is a competent architect, and I think he is no less competent than most any architect of that type that I could get in there. I will have to watch all architects.

I think if you ever tried to build a house you realize that unless you watch the architect yourself you are not quite sure what is going on. It is standard, but I do not have to watch and guide him at this point any more than I do any other architect, and I feel he is a competent architect.

However, I have, as I say now, six architects, A-E's on that job, and Kruger is confining his work solely to the town type of construction, housing and hospital and things of that nature.

The technical construction I have under contract with a number of other architects because I do not feel that Kruger is a technical construction type of architect. He is an architect and not an engineer.

Mr. VOLPE. Mr. Chairman, on the question of the suit, I think we need to clarify one point. We have not recommended to the Attorney General that suit be brought against this contractor. We have merely sent over to the Attorney General, because it seems to be sufficient, information to raise a fairly serious question about the possibilities of recovering, and we have asked the Attorney General to consider that, so there has not been a recommendation that a suit be brought.

The CHAIRMAN. Well, Captain Tyler said that he had supervised some \$36,000,000 worth of construction for which he had gotten fees aggregating some two million-some-odd hundred thousand dollars.

Now, Captain, you say that he is an ordinary run-of-the-mill architect. He is not an engineer.

Mr. TYLER. He is an architectural type of A-E, as opposed to an engineer. We have another architect-engineer, Black & Veatch, who are recognized, and I would not ask them to build a house. Their field, their specific field—

The CHAIRMAN. But Kruger is supervising architect on \$36,000,000 worth of construction.

Mr. TYLER. He has been over a period of 3 years.

The CHAIRMAN. You did not bring him in, but the Manhattan Engineer District brought him in there, and he seems to have done pretty well.

Mr. TYLER. He has done a good job within reason, I feel.

He made one mistake, and, as I say, that is why I had the investigating board of people whom I did not know and had no relation to me nor my project, to find out whether the mistake was his fault, and I read the thing, and in my opinion, it is not conclusively proven that it was his fault or that it was the Manhattan Engineer District's fault or that it was the contracting engineer's fault. I cannot derive from that mess of investigation a fault definitely placeable at anybody's door. It was a combination of bad judgment.

The CHAIRMAN. You have a short matter, Senator?

Senator HICKENLOOPER. Yes, I have.

Mr. Tyler, what is your present need for housing on the hill? That is, what type of people actually need housing?

Mr. TYLER. What type of people, sir?

Senator HICKENLOOPER. What type. I mean, for instance, guards and other people? Do people of that kind need housing?

Mr. TYLER. Yes, sir. Our need for housing is pretty well spread out. May I explain how we allocate our housing, and then that will give you an idea as to who needs housing.

Senator HICKENLOOPER. Yes, sir.

Mr. TYLER. We have a housing-policy board composed of a member of my staff, the Assistant Director of the laboratory, and the head of the Zia Co. There are three employers there. The housing-policy board allocates new housing as it becomes available to the three employers, not necessarily dividing it by three by any means. They each express their needs, and they arrive at an allocation. I reserve the right to review that allocation. Dr. Bradbury reserves the right to review that allocation, but at no time since that board was set up has either Dr. Bradbury nor myself found it necessary to change the recommendations. Therefore, we have employees of the three companies who need housing.

The CHAIRMAN. How much?

Senator HICKENLOOPER. Well, you have here in the budget, I believe, for this year \$3,744,000 for 196 housing units.

Mr. TYLER. I beg your pardon, sir?

Senator HICKENLOOPER. You have in the budget \$3,744,000 for 196 housing units.

Mr. TYLER. That is for the coming year, yes, sir; 1950, fiscal 1950.

Senator HICKENLOOPER. One hundred and ninety-six. Now, that figure is \$19,000-plus per unit.

Mr. TYLER. Yes, sir.

Senator HICKENLOOPER. Are you building \$19,000, \$20,000 houses out there?

Mr. TYLER. I am very glad that you asked that because I am getting some shocks myself in the last day or two.

When I charge for a house I charge for the whole business. I have got to go over on the mesa, which is now a mass of scrub trees, second growth, and rocks, and clear that out, clear out a hunk of a mountain, put in roads, utilities, sewerage, and attach that over to the sewerage system in the town, and so forth, so that brings the cost per house up pretty high.

However, in our group 11 housing, which is the housing now under construction there, we pay roughly, depending on the type of house, from \$14 to \$17 per square foot on a competitive bid.

The housing before that, which is a better type of housing, we are now trying to build as cheaply as we can build, because we want to keep the rents down; people cannot afford to pay too much rent; housing before that had only run about \$12 per square foot.

I estimated this housing that I am not building on this \$12-per-square-foot basis, and as a result, when the bids came in I could not build as many houses because I did not have as much money.

On Saturday, we had bids out for the 1949 program for 458 houses. My engineer's estimate on that was very close to \$7,000,000. I had \$6,400,000 in the budget for that purpose.

To everybody's complete consternation—I do not know why—we got those 458 houses for \$5,400,000.

Senator HICKENLOOPER. Did that include all the land and grading?

Mr. TYLER. That includes the works, and it comes down to \$10 a square foot, and if anybody can explain to me why, I will be delighted. It is ridiculous, but there it is.

The CHAIRMAN. You awarded the bid?

Mr. TYLER. We awarded the bid this week. The bids were opened Saturday at noon when I left.

The CHAIRMAN. What kind of houses?

Mr. TYLER. They are wooden frame houses with asbestos shingles, with sloping roofs.

Senator HICKENLOOPER. How many bedrooms?

Mr. TYLER. Most of these in the incoming group are three and four.

The CHAIRMAN. Did McKee get the contract?

Mr. TYLER. No; that is an association of two or three engineering firms from the San Francisco area. They are the ones who bid the \$14 to \$17 job that they are now working on, and they are also the ones who turned around and bid \$10. That is why I like competitive bidding. Frequently I get a pleasant surprise instead of a disagreeable one.

Senator HICKENLOOPER. Then, on this new unit—

Mr. TYLER. That was the 1949 construction.

Senator HICKENLOOPER. The cost, as I figure it on the 196 houses, divided into \$3,744,000 is approximately \$19,100 a unit.

Mr. TYLER. That is an estimate for budgetary purposes. We do not spend that. That was the best estimate we could figure out at the time for a new development of an area, and with the then existing cost per square foot which we had under contract at that time. As I said—

Senator HICKENLOOPER. Who lives in these houses?

Mr. TYLER. Everybody.

Senator HICKENLOOPER. Well, is it laboratory personnel?

Mr. TYLER. It can be anybody, sir.

Senator HICKENLOOPER. How much rent do you charge for these houses?

Mr. TYLER. The rents vary, Senator. I have a complete list of the rents here. They run from a low in the cheapest type of housing, which is this Wingfoot house—you are familiar with that—it is the one that come up with a truck, with the house and utilities for \$31.80 a month, up to—

Senator HICKENLOOPER. That includes all utilities?

Mr. TYLER. Yes. The rent is in that type of house \$28 a month, and the utilities run about \$3.80. You know what it is. It is really a glorified trailer, except that it has no wheels on it.

The highest rent we have is a four-bedroom house which costs \$89.50, with utilities of \$14.45, making a total of \$103.95.

Senator HICKENLOOPER. What do you get for your two-bedroom houses?

Mr. TYLER. Single house in the western area, which is our best house, we have not yet rented any of these new wooden houses which we are building; we just took 97 of them over last week, and as soon as the road is down this week we will start renting those, but a two-bedroom house in the western area with utilities, single house, runs \$78.45.

Senator HICKENLOOPER. What does it cost to build a four-bedroom house of the type built out there?

Mr. TYLER. As I say, it varies. The ones we are going to build now will cost us about \$10 a square foot. We are building housing—

Senator HICKENLOOPER. You have a fairly standard four-bedroom house?

Mr. TYLER. We have not—this new lot, we have not been building.

Senator HICKENLOOPER. Give me an accurate sample of four-bedroom houses, total costs.

Mr. TYLER. At that rate which we just got on this bid?

Senator HICKENLOOPER. I am not talking about this rate you got on this bid; I am talking of what you have been building them for out there.

Mr. TYLER. Well, I have a four-bedroom apartment type of house—there are four units in a house, two of which are two-bedrooms, and two are four-bedroom, which went for \$10.60 a square foot, and which averaged 1,380 square feet, so that would be——

The CHAIRMAN. \$13,800.

Mr. TYLER. \$13,800, 1,380 square feet.

Senator HICKENLOOPER. What is your so-called western type, four-bedroom ranch house?

Mr. TYLER. That is the only one that we have. Those are the ones that are renting for \$103, as I said. We did not build those; they were there.

Senator HICKENLOOPER. And your three-bedroom houses?

Mr. TYLER. The three-bedroom houses in the western area, sir, a single unit rents for \$87, and one that is in a duplex, two houses in one unit, rents for \$81.50.

Senator HICKENLOOPER. What do they cost to build or what do they cost to erect?

Mr. TYLER. Well, I can find that for you exactly. The duplex was contracted for in 1947 and cost \$9.91 a square foot, and two houses, of which one is a three-bedroom, and one is a two-bedroom, a total of 1,900 square feet, divide it by two, and call it 950 square feet, \$9.91, call it \$10, and you have \$9,500. That was contracted for in July. The same house—not the same house, but the same size house presently under construction, a three-bedroom house, which is a bigger house, is 1,203 square feet, and cost us \$13.29 a square foot.

Senator HICKENLOOPER. There are two more items which I would like to call to your attention.

Mr. TYLER. Yes, sir.

Senator HICKENLOOPER. What is the report as contained in the budget, Mr. Tyler, of expenditures of \$10,000 approximately to landscape the grounds around your cottage at Los Alamos, and about seven or eight thousand dollars for furniture that went into the cottage there. Are there any comments on that?

Mr. TYLER. I have not been aware of the landscaping program because that is part of the whole area there, and I do not pay much attention to it.

Senator HICKENLOOPER. Well, it was contained specifically in the budget some months ago.

Mr. TYLER. The furniture is probably correct, sir. I amortized the furniture in my rent for a 10-year period or something like that.

Senator HICKENLOOPER. Now, the furniture was purchased by McKee?

Mr. TYLER. That was probably one of those complicated stories.

Senator HICKENLOOPER. Well, I think the story roughly is this: It was purchased by Mr. McKee. The matter was not allowed, and then they, Zia, undertook to put it through the Zia accounting, and something got balled up there, and I do not know just where it ended.

Mr. TYLER. I do not know. Every once in a while somebody would come into my office and we would start all over again. The original idea, which I did not pay much attention to—I actually was not there when the contract was let to remodel the house—

Senator HICKENLOOPER. I am not insinuating that you instigated the purchase of the furniture, but it was purchased and put into your house.

Mr. TYLER. Mr. McKee negotiated, was negotiated—Mr. McKee was the contractor for remodeling the house, and in the process of negotiation, somebody in the engineer department very logically said that if they remodeled the house, why, they should buy the furniture. They remodeled it and they bought the furniture, and they said that the building contractor cannot provide furniture under a building contract; it had to be a separate contract, and there the furniture was.

So, they shuffled back and forth and tried to get it through McKee and tried to get Zia to buy it. It is just paid for. It is just one of those accounting messes. The fiscal division and the legal division and everybody got into it, and every once in a while, somebody would come in and say, "Would you mind discussing your furniture again?" I do not know what the answer is. It still is there, and it belongs to the Government, and I use it, and when I leave—and I do not know when that may be—it will still be there.

Senator HICKENLOOPER. The difficulty of chasing furniture through the complications of the books of the Zia Co., the McKee Corp., Atomic Energy Commission, is another incredible item in my book.

Mr. TYLER. Well, that was a question, as I say, of General Accounting Office rules which were uncovered by my fiscal division when it came around to paying the bill.

Senator HICKENLOOPER. I will hurry along to just another item. I have received a number of communications, of which I have one here.

First I would like to read into the record some excerpts—I will put the entire story into the record, Mr. Chairman—but I do not want to hold you any longer. This is a story from, I believe, the Albuquerque Journal, of June 3 or 2, in which it is stated as follows:

The director of the Sandia base laboratories and the field manager for the Atomic Energy Commission will each occupy \$38,000 homes in the near future if the bid of L. M. Mauldin, Albuquerque contractor, is accepted.

Now, there is an editorial in the Albuquerque Journal of June 3, calling attention to that fact, and two paragraphs, for instance, from that editorial, are as follows:

Take our own Sandia base. Its operations are clothed in secrecy as they should be. But such matters as the cost of housing at the base are worth the scrutiny of the taxpayers.

For instance, the director of the Sandia base laboratories and the field manager for the Atomic Energy Commission will each occupy a house on the base that will cost about \$38,000.

(The newspaper items referred to follow:)

[From the Albuquerque Journal, Friday, June 3, 1949]

#### TOO EARLY TO PREDICT

Representative Fernandez confidently predicts that Atomic Energy Commission Chairman Lillienthal will be completely cleared of charges of "gross mismanagement."

Maybe so. But we fail to apprehend how Congressman Fernandez or any other governmental official can forecast so early the outcome of an atomic management investigation that involves America's vital defenses.

Congressman Fernandez on most major issues has shown an independent attitude that commended him to the electorate as a lawmaker of courage and high ideals.

We submit, however, that neither Congressman Fernandez nor any other Congressman, Senator, or what not should speculate on the Lillenthal case until all the evidence is in.

Even more matters than our national security are involved. There's the matter of cost. Americans will not balk at the cost of security so long as that cost is on the basis of "dollar for dollar" value. However, there must be a check somewhere on the cost of the vast so-called preparedness program.

Take our own Sandia base. Its operations are clothed in secrecy as they should be. But such matters as the cost of housing at the base are worth the scrutiny of the taxpayers.

For instance, the director of the Sandia base laboratories and the field manager for the Atomic Energy Commission will each occupy a house on the base that will cost about \$38,000.

The American taxpayer will dig up to the limit to provide adequate security and protection for this Nation. He rebels, however, at providing frills and finery.

The atomic energy investigation now going on in Washington is centered on how our national security is being guarded. That is, of course, the No. 1 problem. But we hope the quiz also will delve into the expense angle. The American people are interested in that too.

---

#### SANDIA EXECUTIVES TO OCCUPY TWO \$38,000 HOMES

The director of the Sandia base laboratories and the field manager for the Atomic Energy Commission will each occupy \$38,000 homes in the near future if the bid of L. M. Mauldin, Albuquerque contractor, is accepted.

Mauldin bid \$76,462 Wednesday for construction of the two four-bedroom homes at Sandia base for the Atomic Energy Commission.

Some difficulty was encountered in determining for whom the two homes were to be built. Original notices of the work from the district engineer's office here stated merely that the homes were of the type generally built for general officers or fleet rank Navy officers.

Capt. George Kraker, field manager for the AEC at Sandia base, disclosed the occupancy plans for the homes—one of them for himself.

Kraker gave the information only after notifying a reporter who called him at his quarters at 6 p. m. Wednesday that he objected to being called after his office hours, which end at 4:30 p. m.

Bids will be opened this afternoon at the district engineer's office here for the construction of 40 three-bedroom family quarters at Hollaman Air Force Base at Alamogordo.

Senator HICKENLOOPER. Now, I have a letter from a taxpayer which—in fact, I have some more letters from taxpayers, but this is rather typical—object very strongly to the \$38,000 homes for these two executives of the Sandia base, paid for by the Government.

Do you have any comment on that, Mr. Tyler?

Mr. TYLER. Yes, sir.

The director of the laboratory and my field manager felt and requested that they have a larger house than was available in the standard construction down there because of their needs, both private and professional, as I am sure that you recognize that a field manager or the laboratory director have many occasions to work at home or where people come in at night and leave work, and they need a study and a few odds and ends, which are not provided in other houses.

They wanted two bathrooms instead of one because they have three children, or something, so I asked them to get an architect-engineer to estimate on it and see what it would look like, and they came up with a house of about 2,100 square feet which, I think, is well within

the Army and Navy requirements for commanding officers' houses in square footage.

This architect-engineer came up with a price of about \$22,000, which was a reasonable price for a house that large. So we advertised for bids. When the bids came in the houses averaged \$38,000 apiece. I called Mr. Kraker, Mr. Kraker called me rather, and said, "I could not be happy living in a house that cost that much money. I do not want it."

We canceled the bids and are not going to build the houses.

Senator HICKENLOOPER. The cancellation came, I take it——

Mr. TYLER. The bids were rejected, may I say that. When they were opened they were immediately rejected. I do not know, but the bids were probably opened about the time that you have that clipping from the newspaper.

Senator HICKENLOOPER. Well, I think the bids were opened about the second of June.

Mr. TYLER. The bids were canceled, were rejected immediately.

Senator HICKENLOOPER. Yes.

Mr. TYLER. By telephone.

Senator HICKENLOOPER. I am pleased about that.

Now, I think, Mr. Chairman, I have one or two other matters that I would like to take up. For instance, I would have liked to have gone into the matter of—I will just ask quickly, and I will not go into it in detail—about, for instance, when I was in Los Alamos last fall, an examination of the operating loss for the cafeterias and the restaurant or the feeding establishment in the Fuller Lodge had run an operating loss of some \$68,000 over the previous 6 months. I do not know; I have not seen the figures; I do not know whether that is continuing or not, but it seems to be an unconscionable loss, considering the patronage that was available, and the monopolistic—I say that kindly—it was a monopolistic operation of the feeding establishments for the people there, and to run that kind of loss, \$10,000 a month, seemed to me to be so far out of line as to be totally un-understandable.

Mr. TYLER. I agree with you, sir; very briefly on that, I recognize the time element—as I mentioned the other day, the lodge is the only eating establishment the Government still runs or Zia runs for us, and the lodge, with its eating and rooming establishment, lost in the month of April \$600.

Senator HICKENLOOPER. Who runs the cafeteria?

Mr. TYLER. The cafeteria is out on concession.

Senator HICKENLOOPER. Concession?

Mr. TYLER. And the Government gets a return, I believe 2 percent, of his gross, and his gross runs about \$18,000 a month, so we are making money on that one.

Senator HICKENLOOPER. My point in that was that I did not have the figures since that period of time.

Mr. TYLER. No, sir.

Senator HICKENLOOPER. I wanted your assurance as to whether or not we were still operating on that kind of a losing basis or whether that situation has been corrected.

So far as the cafeteria is concerned, I understand it has been corrected?

Mr. TYLER. We are out of business in the cafeteria business.

**Senator HICKENLOOPER.** It was a matter of some moment at the time out there, and I made some observations about it, and I am glad that it has been corrected.

Now, Mr. Chairman, I shall not hold you any longer.

**The CHAIRMAN.** I would like to stay, Senator, but I have two guests for lunch.

Now, as I understand it, Senator Hickenlooper has a long-standing engagement in Iowa on Monday which he made some months ago, so we will be unable to resume the hearings until Tuesday.

On Tuesday, Senator, do you intend to pursue Los Alamos any further?

**Senator HICKENLOOPER.** Well, there are a number of lesser items on Los Alamos that I would like to pursue, and there are some of these that I would like to pursue in more detail, but I think in the interest of time, that at least for the moment, I will want to go on down to Oak Ridge from Los Alamos, and probably will want to take up Oak Ridge matters on Tuesday.

**Mr. TYLER.** Mr. Chairman and Senator Hickenlooper, I am naturally available and will continue to be available. I would like to go home. I have been away from the project for a week, and this is an extremely busy month, being the end of the fiscal year.

I would like to go back to work. I can get over here on 12 hours' notice on an overnight flight, and would be very glad to return. I think actually the Military Application Division, General McCormack, has a great deal of information; I try to keep him fully informed, and I think he would be able to answer your questions. I am not trying to pass this on to General McCormack and put him in a bad spot.

**Senator HICKENLOOPER.** I would not open up without letting somebody know that I intend to. I feel some of these matters have been very inadequately probed, but I do want to hurry along.

**Mr. WILSON.** Mr. Chairman, I would hope that we would have an opportunity to go into all the matters that Senator Hickenlooper has in regard to Los Alamos, and if we do not do it now or on Tuesday, that the opportunity would be presented later.

**The CHAIRMAN.** Of course, Mr. Wilson. We have not deviated from the standard we set down at the beginning of this matter, that you will have a full opportunity to go into those matters at Los Alamos.

(Whereupon, at 1:25 p. m., the joint committee adjourned, to reconvene at 10:30 a. m., Tuesday, June 28, 1949.)

# INVESTIGATION INTO THE UNITED STATES ATOMIC ENERGY PROJECT

---

TUESDAY, JUNE 28, 1949

CONGRESS OF THE UNITED STATES,  
JOINT COMMITTEE ON ATOMIC ENERGY,  
*Washington, D. C.*

The joint committee met, pursuant to adjournment, at 10:35 a. m., in the Caucus Room, Senate Office Building, Washington, D. C., Senator Brien McMahon (chairman) presiding.

Present: Senator McMahon (chairman), Representative Durham (vice chairman), Senators Millikin and Hickenlooper, and Representatives Price and Hinshaw.

Also present: David E. Lilienthal, Chairman; Sumner T. Pike, Commissioner; Lewis L. Strauss, Commissioner; Gordon E. Dean, Commissioner; Henry D. Smyth, Commissioner; Carroll L. Wilson, General Manager; Carleton Shugg, Deputy General Manager; Frances Henderson, Assistant to the Chairman; Brig. Gen. James McCormack, Jr., Director, Division of Military Application; Walter J. Williams, Director, and Carroll Towne, Division of Production; Joseph Volpe, Jr., General Counsel; Bennett Boskey and Everett L. Hollis, Office of the General Counsel; Morse Salisbury, Director, and Rodney L. Southwick, Division of Public and Technical Information Service; Fletcher C. Waller, Director, Division of Organization and Personnel; Richard W. Cook, Acting Manager; S. H. Sapirie, Chief of Engineering and Production; and Fred W. Ford, Director of Community Affairs, Oak Ridge Operations Office—all of the United States Atomic Energy Commission.

Clinton Hernandez, Vice President; Lyle D. Worrell, Assistant Project Manager; L. C. Macneal, Project Manager; and St. John W. Davis, Audit and Budget Division Manager, of the Roane-Anderson Co. (Oak Ridge); Clark Center, General Superintendent; William B. Humes, Superintendent, K-25; Clarence E. Larson, Superintendent, Y-12; Oral Rinehart, Controller; and Logan Emlett, Superintendent, Operations Division, Oak Ridge National Laboratory, of the Carbide and Carbon Chemicals Corporation (Oak Ridge).

The CHAIRMAN. The meeting will come to order.

Senator, I think you have something on the Oak Ridge situation today.

Senator HICKENLOOPER. That is right. I expect to go into that today, but there is a little clean-up of information on Hanford and Los Alamos that I would like to get into just to complete the record at this point.

I had asked Mr. Shugg if he would get me the total amount of money that had been paid to J. Gordon Turnbull, Inc., and to Graham,

Anderson, Probst & White, who were the groups that completed this town-planning survey there. I have no particular desire to discuss it one way or the other, except to get the total amount in the record, together with any itemization Mr. Shugg might want to give.

**STATEMENT OF CARLETON SHUGG, DEPUTY GENERAL MANAGER,  
UNITED STATES ATOMIC ENERGY COMMISSION**

Mr. SHUGG. That total fee, which includes direct costs and overhead and profit, was \$47,500. That is for the entire study and the make-up of the final plan.

Senator HICKENLOOPER. That is all the money they have received?

Mr. SHUGG. Yes, sir; for that particular master plan. They also had other projects, though.

Senator HICKENLOOPER. What was the nature of the other projects? Did they have anything to do with this town planning and town management, zoning, operation?

Mr. SHUGG. The entire study of the town, Senator—that is, all the water system and sewage system and the zoning and school districts and all of the utilities—that was all part of the master plan and that was the joint venture for \$47,500.

Senator HICKENLOOPER. That is the total amount paid to both companies?

Mr. SHUGG. Yes, sir.

Senator HICKENLOOPER. Now, I think that is all, unless you had some other break-down on that.

Mr. SHUGG. No, sir.

Senator HICKENLOOPER. Thank you very much.

Now, so far as Los Alamos is concerned, first, I have the committee file here, Mr. Chairman, on correspondence with respect to western housing. I would like to have the record show at this time the copy of my letter of September 14, 1948, directed to Mr. Lilienthal, Chairman of the Atomic Energy Commission, calling attention to the loss to the Government of at least \$250,000. I would like to read it into the record at this time, because that was the letter in which I asked for the fixing of responsibility. It is dated September 14, 1948, and reads as follows:

DAVID E. LILIENTHAL,

*Chairman, Atomic Energy Commission,  
Washington, D. C.*

DEAR MR. LILIENTHAL: The staff of the joint committee has recently completed an examination of the "Report on Defects in Housing Located in Western Housing Area, United States Atomic Energy Commission, Los Alamos, N. Mex."

On my recent trip to Los Alamos, I discussed some of the points raised with the local AEC officials who, in general, seemed to concur with the findings contained in the aforementioned report. It was the consensus that because of faulty construction, the Government sustained a loss of \$250,000.

In a matter involving such a substantial amount of money, it is surprising to me that no responsibility has been fixed and no attempt has been made to secure reimbursement to the Government.

In order that the joint committee may be fully informed on this matter, therefore, it is requested that the Atomic Energy Commission submit its official opinion on the question of responsibility in this matter, together with a statement as to any action to be taken in connection therewith.

I find no record here in the file of a reply, but it seems that a reply was given, either by telephone or otherwise, to this letter, saying that the Commission would look into it.

The next formal action on this matter is a letter from Mr. Lilienthal as Chairman of the Commission, dated June 3, 1949, addressed to Senator McMahon as chairman of the joint committee, in which Mr. Lilienthal says that the matter has been referred to the Attorney General, together with an analysis of the situation.

The staff prepared or sent a copy of those letters, Mr. Chairman, and I wonder if my letter of September 14, 1948, a copy, and Mr. Lilienthal's letter of June 3, 1949, and a copy of the Commission's letter to the Attorney General in this matter may go in the record at this point.

The CHAIRMAN. It is so ordered.

Senator HICKENLOOPER. I think there is nothing classified about those letters.

(The correspondence referred to follows:)

[Copy]

SEPTEMBER 14, 1948.

DAVID E. LILIENTHAL,  
*Chairman, Atomic Energy Commission,  
Washington, D. C.*

DEAR MR. LILIENTHAL: The staff of the joint committee has recently completed an examination of the "Report on Defects in Housing Located in Western Housing Area, United States Atomic Energy Commission, Los Alamos, N. Mex."

On my recent trip to Los Alamos I discussed some of the points raised with the local AEC officials who, in general, seemed to concur with the findings contained in the afore-mentioned report. It was the consensus that because of faulty construction the Government sustained a loss of \$250,000.

In a matter involving such a substantial amount of money it is surprising to me that no responsibility has been fixed and no attempt has been made to secure reimbursement to the Government.

In order that the joint committee may be fully informed on this matter, therefore, it is requested that the Atomic Energy Commission submit its official opinion on the question of responsibility in this matter, together with a statement as to any action to be taken in connection therewith.

Sincerely yours,

B. B. HICKENLOOPER,  
*Chairman, Joint Committee on Atomic Energy.*

(The above was taken over the phone)

JUNE 3, 1949.

HON. BRIEN MCMAHON,  
*Chairman, Joint Committee on Atomic Energy,  
Senate Office Building, Washington 25, D. C.*

DEAR SENATOR MCMAHON: This is in further reference to a letter, dated September 14, 1948, from the Chairman, Joint Committee on Atomic Energy, concerning the matter of defects in housing in the western housing area at Los Alamos, N. Mex. This matter was the subject of considerable inquiry during the hearings at Los Alamos conducted by the House Expenditures Committee last December.

The housing project was initiated and carried to substantial completion under the jurisdiction of the Manhattan Engineer District. Soon after jurisdiction over the project was transferred from the district to the Atomic Energy Commission, it became apparent to our Los Alamos office that the housing units did not meet ordinary standards for permanent construction and that modifications and repairs would be necessary in order to meet such standards. We are informed that the need for housing at the time, however, was so urgent that it was considered advisable to complete the construction of the few remaining houses without change in design or specification and to make the necessary changes in all houses after completion and occupation of the entire area.

It has been possible to establish rather conclusively the facts concerning the nature and scope of the defects in the housing units and to ascertain with consid-

erable definiteness the facts regarding the primary causes of the defects. It has proved a much more difficult undertaking, however, to develop the facts necessary to fix responsibility for the defects.

We are informed that due to an acute shortage of Government personnel to supervise the construction program, the working relationships between the Government, the architect-engineer, and contractor personnel were apparently conducted in a very informal manner. It appears to have been customary procedure for Government personnel to confer with the architect-engineer and contractor personnel, to reach decisions in these conferences, and to issue verbal instructions and directions, which seldom were reduced to writing. Furthermore, we understand that immediately prior to and during the planning and construction stages of the western housing project the Manhattan Engineer District had numerous changes in personnel as a result of demobilization of Army personnel and the influx of civilians as replacements. This fact has increased the difficulty of verifying verbal instructions.

Notwithstanding diligent attempts to ascertain the facts, we have had great difficulty in obtaining information which in our judgment is adequate for the purpose of fixing responsibility for the housing defects. Indeed, the information we now have is less complete than we would like. Nevertheless, the information is now probably about as complete as the circumstances permit. Since the facts indicate a possible claim by the Government against W. C. Kruger Co., an individual trading under the company name, and its successor W. C. Kruger & Associates, Architects-Engineers, Inc., for the damages suffered by the Government as a result of the housing defects, we have informed the Department of Justice concerning such possible claim and requested that the Department of Justice take such steps as it considers appropriate to protect the interests of the United States in this matter. A copy of our letter to the Department of Justice, together with summary of the facts transmitted therewith, is enclosed for your information.

During the investigation of this matter, appropriate steps have been taken by the Commission to avoid any action which might jeopardize the position of the Government and its chances of recovery of damages. A recent contract with W. C. Kruger & Associates contains an express reservation of claims under previous contracts. We are also withholding final payment in connection with the completion of the work under the contract relating to the housing development, and are deferring action under the price adjustment provisions of that contract, in view of the possible claim.

Sincerely yours,

UNITED STATES ATOMIC ENERGY COMMISSION,  
DAVID E. LILIENTHAL, *Chairman*.

---

UNITED STATES ATOMIC ENERGY COMMISSION,  
*Washington, D. C. May 27, 1949.*

HON. TOM C. CLARK,

*Attorney General, Department of Justice, Washington 25, D. C.*

DEAR MR. ATTORNEY GENERAL: This is to advise you concerning a possible claim for damages by the United States against W. C. Kruger, an individual trading under the company name, W. C. Kruger Co., and his successor, W. C. Kruger & Associates, Architects-Engineers, Inc., based upon breach of a contract relating to a housing development of the Atomic Energy Commission at Los Alamos, N. Mex., and to request that the Department of Justice take such steps as it considers appropriate to protect the interests of the United States in this matter. While the amount of the possible claim is uncertain, the facts available indicate that the amount may be substantial and possibly as much as \$250,000.

The housing project in question was initiated and carried to substantial completion under the jurisdiction of the Manhattan Engineer District of the War Department. We are informed that due to an acute shortage of Government personnel to supervise the construction program, the working relationships between the Government and the architect-engineer were conducted in a very informal manner. It appears to have been the customary procedure for Government personnel to confer with the architect-engineer personnel, to reach decisions in these conferences, and to issue verbal instructions and directions, which seldom were reduced to writing. We understand also that immediately prior to and during the planning and construction stages of the project, the Man-

hattan Engineer District had numerous changes in personnel as a result of demobilization of Army personnel and the influx of civilians as replacements. These factors have measurably increased the difficulty of ascertaining the full facts, including the facts concerning the extent to which the actions taken were pursuant to instructions and directions of the Government or approved by the Government. However, the pertinent facts, to the extent we have been able to develop them, are summarized in a memorandum enclosed herewith.

We shall be pleased to make available to the Department of Justice the various contracts, reports, and other documents relating to this matter, and we suggest that representatives of your Department inform the Office of General Counsel of the Commission concerning your Department's desires in this regard. If you desire additional information, please inform us and we shall endeavor to furnish it.

Sincerely yours,

CARROLL L. WILSON,  
*General Manager.*

---

#### MEMORANDUM

##### SUMMARY OF FACTS CONCERNING WESTERN HOUSING AREA DEFECTS

The United States, represented by the Corps of Engineers, War Department, entered into a lump-sum contract W-17-028-ENG-98 of March 4, 1946, with W. C. Kruger Co., an individual trading under the company name. The contract was transferred to the United States Atomic Energy Commission by Executive Order No. 9816, dated December 31, 1946. This contract, as amended on June 11, 1946, provided for performance by the Kruger Co. of title I and title II architect-engineer services for a specified project which involved, in part, a housing development within the so-called western housing area at Los Alamos.

The title I services included preparation, subject to approval of the contracting officer, of preliminary studies, sketches, and lay-out plans and reports; upon approval of the preliminary drawings by the contracting officer, preparation of final designs and detailed working drawings and specifications in accordance with Government standards necessary for the effective coordination and efficient execution of the construction work, and revision of such drawings and specifications if necessary; checking and approval of all shop and working drawings submitted by the constructor in connection with the construction work to assure that they conform with approved drawings.

The title II services included making all necessary field surveys required to adapt construction to terrain conditions and furnishing all grades which are essential to the construction of the project, furnishing a resident engineer and other personnel approved by the contracting officer to supervise the construction to assure that every part of the work was done in accordance with the approved drawings and specifications and within the areas and boundaries designated for the project, making all field tests at the site of the work and reporting to the contracting officer in writing as to the conformity or nonconformity of the materials and workmanship to specifications, upon termination or completion of the contract, supervising the testing of operating units to assure their conformance with specifications and furnishing all engineering services necessary to secure such conformance.

The contract provided that the extent and character of the work to be done thereunder by the Kruger Co. was subject to the general supervision, direction control and approval of the contracting officer to whom the Kruger Co. was to report and be responsible.

The contract provided for payment to the Kruger Co. of a lump sum of \$73,700 for the title I services (\$61,000 of this sum being applicable to services involving the unit housing development), subject to negotiation of an adjusted price after completion or termination of the contract on the basis of various factors including the efficiency, economy, and ingenuity of contractor but with adjusted price in no event to exceed \$90,000. The contract, as amended on June 11, 1946, also provided for payment to the Kruger Co. of \$15,000 for its title II services involving the housing development. The contract was further amended on April 10, 1947, and April 24, 1947, to provide for additional title I and title II services with regard to the housing development and for an increase of \$6,257 in the payment for the title I services and an increase of \$22,413 for the title II services. Final payment with respect to both the title I and title II services

was to be made under the terms of the contract upon "satisfactory completion of the construction work and its final acceptance."

The contract, as amended, was further amended from time to time to provide for performance by the Kruger Co. of additional title I and title II services which did not involve the housing units and for additional payments to the Kruger Co. for these services. Under these amendments, there was substantial increase in the top limit of the adjusted price.

The contract was also amended on February 1, 1948, to substitute W. C. Kruger and Associates, Architects-Engineers, Inc., for the W. C. Kruger Co. as contracting party, with the proviso that the W. C. Kruger Co. remained liable to the Government with respect to any and all obligations arising under the contract founded on matters which occurred prior to February 1, 1948, and that the Government was accorded the added right to proceed against the corporation therefor.

The Commission on July 15, 1948, entered into a letter agreement with W. C. Kruger and Associates, Architect-Engineers, Inc., which stated the contemplation of the parties to enter into a cost-plus-a-fixed-fee contract, effective as of July 16, 1948, which, among other things, would supersede existing uncompleted lump-sum contracts between the Commission and W. C. Kruger and Associates. The letter agreement provided for performance by W. C. Kruger and Associates on a cost-plus-a-fixed-fee basis pending execution of the definition contract. It is understood that performance of all title I and title II services relating to the housing units had been completed at the time the letter agreement was executed, as well as performance with respect to the other work under the contract. However, final payment under the contract had not been made and the adjusted price had not been negotiated.

The definitive contract contemplated under the letter agreement was executed by the Commission and W. C. Kruger and Associates on February 15, 1949, but effective as of July 16, 1948. This contract contained a whereas clause stating that "there is and has been no intent on the part of the A-E (W. C. Kruger and Associates) and the Commission to in any way effect any of their rights or obligations existing under any previous contracts between the parties by the execution of this definitive agreement or the letter contract superseded thereby."

The construction of the housing units was performed by Robert E. McKee, general contractor, under Contract No. W-17-028-ENG-112 with the War Department, effective as of June 28, 1946. Under the terms of the contract, all material and workmanship (if not otherwise designated by the specifications) were subject to inspection, examination, and test by Government inspectors at any and all times during the manufacture and/or construction and at any and all places where such manufacture and/or construction were carried on. The Government had the right to reject defective material and workmanship or require its correction. Rejected workmanship was to be satisfactorily corrected and rejected material was to be satisfactorily replaced with proper material without charge therefor.

A fact-finding board appointed by the manager, Los Alamos project, on March 1, 1948, reported that a field inspection of the houses in the western housing area disclosed numerous specific defects in many of the houses, including grading and drainage defects, floor settlement from partitions, heater room settlement, floor settlement at prefabricated closets, tub settlement, floor buckling, wall and ceiling cracks, ceiling collapse, beamed ceiling deflection, fireplace cracks in back of firebox, roof leaks, and cracks in the stucco. The board's report concluded that the defects were caused primarily by certain deficiencies in the basic design, the major deficiencies specified being "improper roofing, overloading of structural members, especially sills, and the waiving of the moisture content of the lumber." The report stated, in the latter connection, that, although the waiver was approved by higher authority and probably was at the request of higher authority, it was the responsibility of the architect-engineer, when this change was made, to check framing details and strengthen where necessary. The report further concluded that the "deficiencies should have been observed and corrected by the inspection force." While the report found that in a few instances the work had not been executed in the best and most workmanlike manner, the board concluded that the quality of construction was good since speed of construction was of major importance.

A memorandum from Mr. Carroll Tyler to General McCormack, dated October 14, 1948, contains certain additional pertinent facts. This memorandum states, in part, as follows:

"Prior to initiating the plans and specifications for the western housing area, the Manhattan Engineer District employed a city planning engineer recommended by the Planning Division, Corps of Engineers. One of his duties was to assist in determining the building materials and style of architecture most suitable for Los Alamos. As a result of this planning, the Southwestern type of architecture with flat roofs and adobe type exteriors was selected. Two such houses were designed by the architect-engineer and constructed as a test of the basic design, the utility of floor plan and suitability of available construction materials to the geographical area. These two houses were satisfactory and the architect-engineer was instructed to use them as a basis for final plans and specifications, deleting unnecessary frills. The normal procedure was then followed by the architect-engineer; using the basic designs of the experimental houses, he prepared preliminary plans and specifications and submitted same to the representatives of the Government. Numerous changes were made in the preliminary plans by the Government representatives in collaboration with some of the people who would eventually occupy the houses; the architect-engineer was instructed to prepare the final plans and specifications incorporating these changes. Additional changes were required by representatives of the Government during the preparation of the final plans and specifications, after completion of final plans and specifications and approval thereof by the Government, and after the contract for construction of the houses was let."

The memorandum also states that if the quality of lumber originally specified by the architect-engineer had been used, many of the difficulties experienced would not have arisen. Since it was impossible to procure lumber of the quality specified, the specifications were changed prior to bidding to provide that framing lumber from various depots and War Department establishments would be furnished by the Government. The memorandum concludes that it was impossible to exercise any control over the moisture content of the lumber used.

The report of the fact-finding board contains no estimates of the costs to the Government of the housing defects. However, a memorandum from General McCormack to Mr. Carroll Wilson, dated September 17, 1948, estimates at \$250,000 the direct cost for reroofing, shoring, patching, and painting to correct the defects.

Following the report of the fact-finding board and preparation of the Tyler memorandum setting forth additional facts, a further review was made of the appropriate files relative to the design and construction of the western housing area in an effort to obtain more definite information concerning the extent to which the Kruger Co. acted pursuant to directions and instructions of the Government and the extent to which the plans and drawings prepared by the Kruger Co. were approved by the Government. This further review indicated that little additional information of significance was found, except the fact that the contract drawings which were prepared by the Kruger Co. bear the signature approval of the acting commanding officer, Col. A. W. Betts. The report dated April 12, 1949, based upon the additional review, lists the following as the key Government representatives in charge of administration of the Kruger contract during the design of the housing units:

- L. E. Seeman, colonel, C. E., commanding officer
- A. W. Betts, colonel, C. E., technical deputy
- W. A. Stevens, lieutenant colonel, C. E., post deputy
- W. J. Penley, lieutenant colonel, C. E., operation officer
- Max Flatow, lieutenant, C. E., Head, Engineering Division
- Frank DiLuzio, Master Sergeant, Chief, Civil Engineering and Contracts Branch

The report also includes certain documentary materials indicating that the cost of extraordinary maintenance work with respect to the housing units up to June 30, 1948, amounted to approximately \$64,000. On June 30, 1948, a contract No. AT-29-1-GEN-454, which included repairs and improvements with respect to the housing units, was executed. The extent to which the costs involved under this contract are attributable to the defects in the housing units has not yet been ascertained. The Commission is withholding final payment under the provisions of the contract of March 4, 1946, as amended, and is deferring action under the price adjustment provisions of that contract in view of the possible claim against W. C. Kruger and W. C. Kruger & Associates, Inc., for the housing defects. The final payment retention, however, probably involves only a small part of the total damages suffered by the Government because of such defects.

Senator HICKENLOOPER. In regard to the Los Alamos situation, I shall not press this point this morning, because I said that Mr. Tyler could go back to Los Alamos, but this is information I would like to have in the record at the moment.

I would like to have the total amount of money paid, reimbursed to the Zia Corp. for the years 1947 and 1948. That is in total.

I would like to have the reimbursable salaries or wages paid by the Government to the Zia Corp. for any administrative or executive officials, such as any officers of the corporation or the general manager or the man who has charge of the Zia Corp. actively in the field, and the top three salaries paid by the Zia Corp.

I sent word about 9 o'clock through the committee to the Commission asking for those figures. If you have them, I would appreciate it if they could be put in the record at the moment. If you do not, perhaps you can get them within a day or two.

(The data referred to above are marked "Exhibit 21" and will be found in the appendix.)

General McCORMACK. I have the figures, Senator Hickenlooper, for a date that is not quite current. I am checking the specific figures on these questions with Los Alamos at the moment, and I will have them for you at the end of this morning's hearing.

Senator HICKENLOOPER. You may have the time to be sure your figures are accurate.

General McCORMACK. May I inquire whether you mean fiscal years or calendar years for the method of presenting this? The fiscal year would tie in better with our budget presentation, if there is a desire for a back-check there.

Senator HICKENLOOPER. The fiscal year—would that bring you up to July 1 this year?

General McCORMACK. It would take us through the last monthly payment, which is not quite the fiscal year.

Senator HICKENLOOPER. Make it the fiscal year, so we will have it divided by annual payments. I am interested in the reimbursable salaries of executive officials or managing officials of the Zia Corp., the top three. I do not care to go below the top three salaries paid by the Zia Corp. which are reimbursed by the Government.

I would like to hurry and get on down to Oak Ridge, Mr. Chairman, and for a preface of the Oak Ridge situation I would like to read some telegrams I have received from veterans' organizations in Oak Ridge.

This is a telegram addressed to me, dated May 18, 1949, and reads:

The Raymond C. Mason Post No. 6351, Veterans of Foreign Wars, Oak Ridge, Tenn., tonight passed unanimously a resolution calling for the immediate discharge of David E. Lillenthal as Chairman of the Atomic Energy Commission due to his statement before the Senate-House committee investigating fellowship awards to Communist students on Monday, May 16, 1949, at which time he stated, that he (Lillenthal) would accept a known Communist in the fellowship student-aid program in scientific research if the National Research Council recommended the student. The resolution also requests that President Truman immediately demand Lillenthal's resignation. The resolution further asks that all veterans' organizations throughout the United States pass similar resolutions at their next regular meeting. A resolution also asks the immediate withdrawal of all fellowship awards to known Communists.

The Raymond C. Mason Post No. 6351, Veterans Foreign Wars, Oak Ridge, Tenn.

I have this telegram, dated May 27, from the Disabled American Veterans of Oak Ridge, reading:

Chapter No. 26, Disabled American Veterans, of Oak Ridge, last night passed unanimously a resolution requesting the Joint House-Senate Atomic Energy Committee to inquire into and investigate the Atomic Energy Commission's new personnel policy set-up which became effective January 9, 1949, at which time all AEC and permanent civil-service employees of the AEC became regular AEC excepted appointment employees. The resolution alleges that the AEC has grossly violated section 12 of Public Law 585, of the Seventy-ninth Congress, commonly known as the Atomic Energy Act of 1946. The act does provide for excepted appointments for scientific and professional employees. However, the law specifically states that such officers and employees shall be appointed in accordance with civil-service laws, except that to the extent the AEC Commission deems such action necessary to the discharge of its responsibilities, personnel may be employed and their compensation fixed without regard to such laws. In view of the above this Disabled American Veterans chapter feels that it was strictly the intent of Congress that all AEC employees be civil-service employees with the exception of scientific and professional, such as project managers, scientists, doctors, lawyers, engineers, et cetera.

The resolution further alleges that the AEC arbitrarily withdrew from civil-service rules and regulations and without consultation and regard to its permanent civil-service employees this personnel action was taken against the wishes of the overwhelming majority of AEC's permanent civil-service employees. The AEC's new personnel action has resulted in the wholesale discharge of competent and capable disabled veterans as well as nondisabled veterans, which in the majority of cases could not have occurred under civil-service rules and regulations.

The resolution further states that the members of this chapter feel that it is both a dangerous and unfair situation when the AEC does not have to account to anyone for its personnel actions with the exception of the joint AEC congressional committee and the President.

The CHAIRMAN. I wonder if they want them to report to them—nobody but the committee and the President.

Senator HICKENLOOPER (continuing):

We sincerely ask and trust that the Congress will immediately ask a ruling and decision as to just what was the intent of Congress in this respect at the time the Atomic Energy Act was enacted. In the event the intent of Congress permits the AEC to continue its present personnel policy, we kindly request the act be amended as follows: That the only excepted employees be professional and scientific such as set out previously in this resolution.

We further ask that the law be amended to restore all other employees such as typists, clerks, stenographers, warehousemen, guards, patrolmen, supervisors, etc., back to and under civil-service rules and regulations.

We further allege that the morale of all previous permanent civil-service employees now working with the AEC has declined to a very low stage.

We sincerely solicit your fair and impartial assistance in this very important matter.

TENNESSEE DISABLED AMERICAN VETERANS CHAPTER,  
Box 145, Oak Ridge, Tenn.

Then on June 27 I got another telegram from the Veterans of Foreign Wars, Oak Ridge, Tenn., signed Raymond C. Mason, Post No. 6351, reading:

May it be resolved that our post protests the absolute disregard of the Veterans' Preference Act of 1944, as amended, to effect AEC and subcontractors or any other place that Government money is disbursed. After State convention last week in Jackson, Tenn., similar resolutions were passed, copies of which I am mailing to you. We respectfully request that you give this matter your attention.

I have a telegram dated June 27, 1949, addressed to me, reading as follows:

The AMVETS Oak Ridge Post No. 2 has unanimously passed a resolution opposing the personnel policy that the AEC here has adopted and made effective since

January 9, 1949. There has been veterans terminated from their position when nonveterans are remaining on the job, just because of a job title that is slightly different than the nonveteran although the veteran is more qualified than nonveteran. It is our belief in accordance with the Veterans' Preference Act of 1944 that if a veteran is qualified for the job, the veteran takes the position in preference to the nonveteran where Government money is spent. This is not the policy of the AEC here in Oak Ridge, Tenn. If you desire instances and names of 10-point veterans and veterans that have been terminated and nonveterans remaining on the job we will gladly forward them to you without delay. We feel that something should be done about the treatment that the veterans are getting here in Oak Ridge. We have tried locally but without results.

HOWARD L. WILKINSON,  
*Commander, Oak Ridge Post No. 2.*

Here is a resolution from the Rockwood Post No. 4782 of the Veterans of Foreign Wars in that vicinity, reading:

Whereas it appears that the Atomic Energy Commission has granted AEC scholarships to avowed Communists and, whereas, it appears that David E. Lilienthal, Chairman of the Atomic Energy Commission, has publicly approved the appointment of one Hans Freistadt, an avowed Communist, to an AEC scholarship, and that the said David E. Lilienthal has condoned other acts believed to be detrimental to the United States: Now, therefore, be it

*Resolved, by Rockwood Post No. 4782, Veterans of Foreign Wars*, Shall go on record as condemning the granting of such scholarships to Communists, and that a letter be forwarded to Comrade Harry Truman, President of the United States, condemning such appointments, and demanding the resignation of the said David E. Lilienthal, Chairman of the Atomic Energy Commission; and that the said post also opposes Government awards of scholarships to anyone who is a Communist, or who otherwise believes in any philosophy of life contrary to the basic principles upon which this Government is based and under which it has prospered so well for so many years; be it further

*Resolved*, That a copy of this resolution be forwarded to Senator Hickenlooper, chairman of the Senate Atomic Committee—

I will correct that, Mr. Chairman, and apologize—Senate Chamber, Washington, D. C.

Read, and adopted this the 6th day of June 1949.

It is signed by "Fred Eackles, Jr.," I presume that name is, and then "Attest: O. C. Gibson, Adjutant."

I have a letter here to which I will just refer, Mr. Chairman, from an attorney in Knoxville, stating that the American Legion Post at Oak Ridge has adopted resolutions touching this matter and that copies of the resolutions are being forwarded to me; but I have not yet received them. So I will not pretend to say exactly what is in the resolutions until they arrive.

Now, I would like to start an inquiry into some of the administrative and business practices at Oak Ridge. I would first like to go into the operation of the Roane-Anderson Co., which is a maintenance company in Oak Ridge, of a somewhat similar character to the Zia Co. in Los Alamos.

Mr. VOLPE. Excuse me, sir. Before we leave the subject of these telegrams, I would merely like to say that the action taken by the Commission with respect to personnel in no way affects the status of veterans under the Veterans' Preference Act.

Senator HICKENLOOPER. I have a number of private letters from veterans taking direct issue with that statement. Their position is that veterans' preference has been thrown out the window at Oak Ridge. I do not know. We may be able to go into that later. I am merely putting the protests in the record.

**STATEMENT OF RICHARD W. COOK, ACTING MANAGER, OAK RIDGE OPERATIONS OFFICE, ACCOMPANIED BY CARROLL L. WILSON, GENERAL MANAGER, WALTER J. WILLIAMS, DIRECTOR, DIVISION OF PRODUCTION, AND JOSEPH VOLPE, JR., GENERAL COUNSEL, ALL OF THE UNITED STATES ATOMIC ENERGY COMMISSION**

Senator HICKENLOOPER. It is my understanding that the Roane-Anderson Co., as I said a moment ago, is a management company employed by the Commission to operate the town of Oak Ridge. It is also my information that Roane-Anderson in operating the town of Oak Ridge is fully reimbursed for all expenditures—that is, within the allowable limits of expenditures in that town—the costs of all materials, the costs of wages of employees, and all such things are fully reimbursed by the Government, that is, by the Atomic Energy Commission—and that after such reimbursement, the firm of Roane-Anderson gets \$192,000 clear for what has been referred to as “know-how” and that out of that \$192,000 there are no expenses and no salaries paid whatsoever, except it is turned in to the corporation, the Roane-Anderson Co., presumably in the nature of a fixed profit on top of all reimbursable items.

Now, is there any comment on that, or can we get that explored?

Mr. WILSON. Mr. Chairman, we have here this morning Mr. R. W. Cook, who is acting manager for the Oak Ridge operations office of the AEC; Mr. Fred Ford, who is in charge of community operations for AEC under Mr. Cook at Oak Ridge; we also have present in the meeting room representatives of the Carbide & Carbon Chemical Corp., which operates the plants and laboratories, and representatives of the Roane-Anderson Co.

I would like to ask Mr. Cook or Mr. Williams, to whom Mr. Cook reports in the organization, to speak to the subject of the Roane-Anderson contract and functions which the Roane-Anderson Co. performs for the Commission at Oak Ridge.

Mr. Cook. I think the best way to give you a complete picture of the work done by Roane-Anderson Co. for the Commission is to read excerpts from a prepared statement.

The Roane-Anderson Co. is a Tennessee corporation, a wholly-owned subsidiary of the Turner Construction Co., of New York, and entered into a cost-plus-a-fixed-fee contract with the Manhattan District, effective September 23, 1943, to operate and maintain Government-owned facilities and properties, with the exception of production plants in the Oak Ridge area.

On January 1, 1947, in accordance with the provisions of the Atomic Energy Act and Executive orders, the contract was transferred from the Manhattan District to the Atomic Energy Commission. The Roane-Anderson Co. was formed for the sole purpose of carrying on the work required by this contract and no other activities are carried on by this company.

In carrying out its responsibilities under the contract, the company proceeds as directed by the Commission under policies established by the Commission or in accordance with policies and procedures recom-

mended by the company and approved by the Commission. At the present time the company operations include the following:

Operation and maintenance of 8,999 family units, housing approximately 30,000 individuals, 15 active dormitories housing approximately 1,850 individuals, a private trailer camp housing approximately 145 individuals, and other miscellaneous housing covering the total housing requirements of a population of approximately 32,000 people.

Senator MILLIKIN. May I interrupt a moment?

Mr. Chairman, are we on the roll?

The CHAIRMAN. Yes; I think so, Senator. I made an arrangement to have it announced that we would be here.

Proceed, Mr. Cook.

Mr. COOK. Under real-estate management is included maintenance of commercial properties rented on concession lease or license basis for the operations of all types of retail or service establishments normally found in any community such as grocery stores, department stores, barber shops, automotive repair shops, restaurants, office buildings for doctors, insurance agents, dentists, and others.

The company collects revenue for the rental of these commercial properties of approximately \$1,118,000 per year. They collect a revenue for the operation and maintenance of the family-type housing of over \$4,000,000 per year.

Senator HICKENLOOPER. What was the first figure?

Mr. COOK. \$1,118,000.

Senator HICKENLOOPER. And the second figure?

Mr. COOK. Over \$4,000,000. They also operate and maintain the outside electrical distribution system, covering 482 miles of distribution lines with over 9,000 service connections.

Senator MILLIKIN. Mr. Chairman, might I interrupt to ask the witness if he has the figures: What is our total investment in housing at Oak Ridge?

Mr. COOK. I do not have that figure handy, sir, but I can furnish it for the record, if you desire.

(The data referred to above are marked "Exhibit 22" and will be found in the appendix.)

The power transmitted over the distribution system they operate averages approximately 11,000,000 kilowatt-hours per month.

They operate and maintain a water supply system furnishing over 10,000,000 gallons of water per day to approximately 9,000 residential, commercial, and industrial users, including the Y-12 plant and the Oak Ridge National Laboratory.

The system includes 146 miles of water mains, a river pumping station, booster pumping station, reservoirs, filtration plant with a capacity of 18,000,000 gallons per day.

They operate and maintain a steam plant and steam distribution system, furnishing approximately 900,000 pounds of steam per day to the commercial and industrial and Government facilities at Oak Ridge.

They operate and maintain a sewage system serving approximately 9,000—or the same number of units.

They maintain 233 miles of roads, 64 miles of wooden sidewalks, 82 miles of stone sidewalks, 94 miles of bituminous and concrete sidewalks, 54 cemeteries, 146 parking areas.

They are responsible for the construction and erection of traffic and safety signs.

Senator HICKENLOOPER. Did you say 54 cemeteries?

Mr. COOK. Yes, sir. Those are the cemeteries that were on the area when the Manhattan District formally took over, and it is the responsibility—

Senator HICKENLOOPER. You mean cemeteries of very small towns in that area; is that it?

Mr. COOK. Community cemeteries. There are quite a few churches and each church has a cemetery, and it is our responsibility to maintain them and to permit people who desire to use them.

They maintain the drainage system, including construction of necessary additions and improvements to the system; also carry on a soil erosion control program and the construction of necessary improvement and additions to the roads and streets system.

Problems in connection with the drainage and soil-erosion control are complicated by the fact that the Oak Ridge area has an average rainfall of from 50 to 70 inches per year.

They operate warehousing, classifying, and handling of all activities necessary for the disposal of excess serviceable Government-owned materials, equipment, and supplies. The value of such materials presently being handled is over \$850,000 per year.

They handle all of the activities necessary for the sale of Government-owned unserviceable material, equipment, and supplies, including scrap salvage and small lots of serviceable items. Revenue collected by the company for these operations since July 1, 1948, exceeds \$350,000.

They furnish all types of fuel and engineering services needed in connection with the construction of improvements and additions to Government-owned facilities, utilities, property in the Oak Ridge area, with the exception of the production plants.

Senator HICKENLOOPER. Facilities—you mean housing, buildings?

Mr. COOK. Commercial facilities, houses, public utilities.

They operate a U-Drive-It and chauffeur-driven motor pool, providing both on-area and off-area transportation service to representatives of the Commission, the Roane-Anderson Co., and other Commission contractors on the area.

They install, maintain, and repair the radio facilities and equipment used by the Commission on the area.

They provide payment of compensation to individuals carried on the company pay roll, but working under the direct supervision of the Commission engaged in such activities as police, fire protection, public safety, public-library operation, public health, community recreation, welfare department, and other miscellaneous municipal activities.

The company procures and maintains the necessary supplies, equipment, and materials used in carrying on these activities and accounts for any revenues accruing to the Government from such activities.

They maintain and repair, including the furnishing of utilities and cleaning service, the structures used by the Commission as office space for the Commission employees at Oak Ridge and for such other Commission contractors as the Oak Ridge Institute of Nuclear Studies, the Anderson County School Board, and others.

They maintain public grounds such as parks, playgrounds, recreation halls, chapels, and others.

They furnish and deliver coal to 9,000 residential, commercial, industrial, and public buildings and also provide garbage and refuse removal.

In carrying out the activities as just reviewed, the company is organized on a division-operating basis with functions, responsibilities, and authority assigned to each operating division.

In addition to the line operating divisions, it is necessary for the company to have staff departments and divisions that any other company carrying on activities similar in scope would have, such as office services, personnel, employment, organization, procurement, central warehousing, audit, budget, accounting, control, and administration.

The work for which the Roane-Anderson Co. is responsible is carried out by the employees on the company pay roll or is subcontracted on an incentive lump sum or unit price contract or concession basis.

On June 13, 1949, there was a total of 1,881 individuals on the company pay roll, 1,564 of whom worked under the direct supervision of the company, 317 worked under the direct supervision of the Commission on municipal activities.

As of the same date—

The CHAIRMAN. Why should you carry on the Roane-Anderson roll the people that work for the Commission on municipal activities?

Mr. Cook. Initially all of the municipal activities since the beginning of the project have been carried on by employees on the Roane-Anderson pay roll. We feel that since they have been on the pay roll for this period of time, built up company service credit, that they should be maintained on Roane-Anderson's pay roll until Oak Ridge can become an incorporated municipal city, and then they will transfer from the Roane-Anderson Corp. to the city pay roll.

Senator HICKENLOOPER. How many total employees does Roane-Anderson have?

Mr. Cook. On June 13 they had 1,881 on their pay roll performing Roane-Anderson activities and 317 on the pay roll performing municipal activities.

Senator HICKENLOOPER. That would be 2,198; is that correct?

Mr. Cook. I made a mistake, sir. The total included the 317.

Senator HICKENLOOPER. How many employees of Roane-Anderson are devoting their time to municipal activities as compared strictly to production or industrial activities of the Commission?

Mr. Cook. I have that figure here, sir, if you will bear with me a minute. On that break-down that I have there are 190 employees performing—this 190 is the proration of the total Roane-Anderson pay roll that might be allocable to municipal employees.

Senator HICKENLOOPER. That means taking care of the streets and other things?

Mr. Cook. That is right, but it does not include the electrical distribution, which is an operation—

Senator HICKENLOOPER. Have you got a break-down as to what these—as I understand it, you say that the total employees of Roane-Anderson is 1,881?

Mr. Cook. That is right.

Senator HICKENLOOPER. Is that correct?

Mr. COOK. That is the figure as of the date I gave it to you. The break-down I have in front of me is as of May 30. There has been some reduction since that time.

Senator HICKENLOOPER. 1,881; and the date was what?

Mr. COOK. June 13 is the date I previously gave.

Senator HICKENLOOPER. June 13 of this year. Now, again, just tell me what those 1,881 people do. How many work in the schools, how many work in town maintenance, and how many work in the direct production facilities of the Commission, if any?

Mr. COOK. May I check this break-down a minute, sir? If it is all right with you, Senator, I would like to go back to the figures as of May 30, which is our last complete break-down.

As of that date we had 1,903 employees in all departments. In the building maintenance were 519; equipment repair, 94; motor pool, 42; engineering and subcontracts, 37; roads and streets, 151; utilities, 133; under public safety, police, 94; fire, 98. That is the fire department and police department.

Senator HICKENLOOPER. Under public safety, does that include guards for the production facilities?

Mr. COOK. No; it does not.

Senator HICKENLOOPER. How many in the fire department?

Mr. COOK. In the fire department, 98. Housing, 92.

Senator HICKENLOOPER. What do they do in housing? Repair work or rental?

Mr. COOK. No, sir. The housing is the management of the housing, rentals, assignments, collections, cleaning, and reassignment.

Under community services, area recreation—I skipped one. After housing comes commercial realty, responsible for the operation of concessions, 63.

Senator HICKENLOOPER. How many concessions do you have under that classification?

Mr. COOK. The approximate figure is 152.

Senator HICKENLOOPER. That is close enough. Now, the community services, I did not get the number there.

Mr. COOK. I will break the community services down into area recreation, 44; library, 9; photo unit, 3.

Senator HICKENLOOPER. What is the photo unit?

Mr. COOK. That was a unit operated by Roane-Anderson for the Commission to take official photographs for various purposes required by the Commission. That unit since has been transferred as of July 1, I think, or will be transferred as of July 1, to the Commission on the direct pay roll.

Senator HICKENLOOPER. Is that all the break-down of community services?

Mr. COOK. No, sir. Public relations, 1; public health, 37; welfare, 17.

The next break-down is materials division: Purchasing, 17; materials and warehousing—

Senator HICKENLOOPER. How many do you have in the materials division altogether?

Mr. COOK. 246.

Senator HICKENLOOPER. All right.

Mr. COOK. Next is administration. Project office, administration, 76; controller's office, 38; accounting department, 94; safety and other, 15.

Senator MILLIKIN. What is the total?

Mr. COOK. 1,903, sir.

Senator MILLIKIN. I mean the last division under administration.

Senator HICKENLOOPER. 233 I get.

Mr. COOK. That is right, sir. If you want a functional break-down—that was a department break-down.

Senator HICKENLOOPER. Does that now make the total of 1,903 employees as of May 30?

Mr. COOK. Yes, sir.

Senator HICKENLOOPER. Now, you now have 1,881 employees as of June 13, 1949; is that correct?

Mr. COOK. That is the figure I read before.

Senator HICKENLOOPER. Therefore, I assume for the sake of brevity we can assume that there have been some proportionate adjustments in these various employment categories to make that.

Mr. COOK. That is right, sir.

Senator HICKENLOOPER. For these services that you render, Roane-Anderson receives full reimbursement, does it not, for all expenditures, including wages and equipment expenditures, and depreciation, and things of that kind?

Mr. COOK. They are reimbursed for their costs of operation; that is right.

Senator HICKENLOOPER. And Roane-Anderson, therefore, does not risk a single cent in this operation.

Mr. COOK. That is not true, sir.

Senator HICKENLOOPER. Where does the risk for Roane-Anderson come? What expenditures does Roane-Anderson make that are not reimbursable?

Mr. COOK. I think the risk they take in conducting their operations is the possibility of exceptions taken by the General Accounting Office.

Senator HICKENLOOPER. But so long as Roane-Anderson goes ahead and stays within the prescribed limits of its expenditures in this operation, which should be pretty well defined, there is no financial risk to Roane-Anderson?

Mr. COOK. Well, the total amount of GAO exceptions to date has been \$367,000, of which \$283,000 has been cleared, leaving a balance of \$83,000 not cleared; and some of these exceptions are over 3 years old.

Senator HICKENLOOPER. But still there is a claim for reimbursement and an attempt to clear it with the GAO?

Mr. COOK. We will attempt to clear it, but there is no assurance that full clearance will be granted.

Senator HICKENLOOPER. Now, your contract calls, in addition to full reimbursement for all legitimate expenditures, that is, all expenditures—

Mr. COOK. That are approved under the terms of the contract.

Senator HICKENLOOPER. Provides for a fee of \$192,000 on top of that per year; does it not?

Mr. COOK. Yes, it does. I would like to—

Senator HICKENLOOPER. Now let me ask you: What is the so-called modification 20 of the contract with Roane-Anderson?

Mr. Cook. Modification 20 provides for the continuation of the operation of the Roane-Anderson Co. It provides for a method of obligation of additional funds for the ensuing fiscal year, and provides for a revised contractor-commission relationship, which we have been working on for some time, where the contractor assumes full management responsibility for his activities.

Senator HICKENLOOPER. Does it provide for additional fees or compensation of any kind for the Roane-Anderson supervision of subcontracts, either of its own or of other subcontractors there?

Mr. Cook. It provides—this supplement provides for the Roane-Anderson Co. taking over and accomplishing by subcontract miscellaneous work formerly accomplished by direct prime contract with the Commission.

Senator HICKENLOOPER. Those subcontracts, are they reimbursable contracts?

Mr. Cook. They are reimbursable contracts.

Senator HICKENLOOPER. Does Roane-Anderson get an additional fee for supervising those subcontracts?

Mr. Cook. They will receive an additional fee for the engineering, inspection, and responsibility involved in handling that additional work.

Senator HICKENLOOPER. In addition to the reimbursement; and that is separate and distinct from the operation of the community? That is in addition to the reimbursement?

Mr. Cook. That is right.

Senator HICKENLOOPER. That is a clear fee or supervisory fee on top of the \$192,000 per year?

Mr. Cook. The \$192,000 provides for the operations that I gave to you just a moment ago.

Senator HICKENLOOPER. I understand that.

Mr. Cook. This is a separate and distinct job that was assigned to the contractor recently.

Senator HICKENLOOPER. I understand. How much money has Roane-Anderson received or how much money will be due Roane-Anderson under present existing subcontracts as a supervisory fee under modification 20 of the contract?

Mr. Cook. That fee will depend upon the amount of work that is transferred to them and for which they are fully responsible. The fee will be calculated in accordance with the fee manual for construction contracts.

Senator HICKENLOOPER. What is the rate of the fee?

Mr. Cook. The rate varies with the scope of the work—the more work involved, the less fee.

Senator HICKENLOOPER. How much money has Roane-Anderson received under modification 20 of the contract?

Mr. Cook. They have not received any to date, sir.

Senator HICKENLOOPER. How much is due Roane-Anderson under operations to date?

Mr. Cook. Under modification 20 under this additional work?

Senator HICKENLOOPER. Yes.

Mr. Cook. No money is due them.

Senator HICKENLOOPER. Does Roane-Anderson supervise now some subcontracts that are in the process of being completed?

Mr. COOK. You mean subcontracts of a construction nature?

Senator HICKENLOOPER. Is Roane-Anderson supervising subcontracts under modification 20 at this time?

Mr. COOK. I have a list of contracts that they are now supervising, sir.

Senator HICKENLOOPER. What is the total amount of those contracts?

Mr. COOK. They fall in two different categories: One under the operating contract and one under the provisions of the new supplement.

Senator HICKENLOOPER. I am interested in those that fall under the new supplement.

Mr. COOK. I would have to separate those out and add them up. Shall I do that later or now?

Senator HICKENLOOPER. I do not like to take the time of compiling figures in this hearing. I certainly had hoped that the business would be run down there so that these figures could be developed and we would not have to stop and figure them out all the time.

I do want to know the total amount of money Roane-Anderson anticipates to get in addition to the \$190,000 fee and in addition to reimbursable items. In other words, a supervisory fee under modification 20 of the contract.

It would seem to me that a reasonable and fairly accurate approximation could be given of that.

Mr. COOK. We will prepare those figures for you and have them the first thing in the morning. Do you have the copy of the revised contract in front of you, article 11, which provides for construction work?

Senator HICKENLOOPER. I do not have that.

Mr. COOK. May I read that, sir, and it will explain just what that work covers?

(The data referred to above are marked "Exhibit 23" and will be found in the appendix.)

Senator HICKENLOOPER. Well, it covers, as I understand, the supervision or the taking over of subcontracts by Roane-Anderson, and I understand for that supervision there is an additional fee or a profit or supervisory fee under modification 20, which would be in addition, an additional revenue to the corporation on top of the \$192,000 a year.

Mr. COOK. This is an additional job that we are turning over to Roane-Anderson that they never before accomplished, and is not a part of their normal operations. I would like to read that to you, sir.

Senator HICKENLOOPER. Well, go ahead. I do not see that it will do anything but delay the matter.

Mr. COOK (reading):

The contractor shall perform such construction work as the Commission may direct from time to time. Such work shall be performed by the contractor's own personnel or may be subcontracted in accordance with the terms of this contract, it being the intent, however, that such construction work will not be done in the main by the contractor's own personnel and that approval of the Commission to the subcontracting or subletting thereof by the contractor will not be unreasonably withheld. In the event that the estimated costs (as mutually agreed upon by the contractor and the Commission) of any construction project which is directed to be performed thereunder after January 1, 1949, exceeds \$25,000 in any instance, the contractor shall be paid an additional fee for the

performance of the excess work (above the \$25,000) involved in such project. Beginning June 30, 1949, and annually thereafter as long as this contract is in force all such construction projects which have been completed during the then current fiscal year shall be reviewed and the amount by which the original estimated cost of each such project exceeds \$25,000 (hereinafter called excess estimated costs of the project) shall be determined and added to the excess estimated cost of all other construction projects completed during that year. The amount of additional fee to be paid to the contractor for that year shall be established on the basis of the total excess estimated cost of all construction projects completed during that year in accordance with the following schedule.

The fee varies, starting with \$200,000, 1.14 percent, to \$5,000,000 with 0.5 percent of the total estimated cost.

In other words, for extra work they have never done before, which was formerly done by the Commission, up to \$25,000 they receive no additional fee.

Senator HICKENLOOPER. Now, who is the general manager or the chief executive officer of Roane-Anderson Co.?

Mr. COOK. The nonresident project manager is Mr. Clinton Hernandez. The resident manager is Mr. Leroy Macneal.

Senator HICKENLOOPER. Mr. Hernandez' salary is reimbursed?

Mr. COOK. Hernandez' salary is not reimbursed. His home office is the New York office of Turner Construction Co.

Senator HICKENLOOPER. He is an official of that company?

Mr. COOK. Yes, sir; and spends a considerable amount of his time in following the work at Oak Ridge.

Senator HICKENLOOPER. What is the resident manager's name?

Mr. COOK. Leroy Macneal.

Senator HICKENLOOPER. Is his salary reimbursed?

Mr. COOK. His salary is reimbursed to the extent of \$12,000 a year. What he receives over and above that I am not familiar with.

Senator HICKENLOOPER. Is there an assistant general manager?

Mr. COOK. He has two assistants.

Senator HICKENLOOPER. What is the salary of each of those assistants that is reimbursed?

Mr. COOK. The assistant project manager is Lyle D. Worrell. We reimburse Roane-Anderson in the amount of \$10,140 a year.

He has another assistant project manager, Mr. C. C. Powell. We reimburse the contractor in the amount of \$8,100 per year.

Senator HICKENLOOPER. Those are the three top reimbursable salaries of Roane-Anderson; is that correct?

Mr. COOK. Those are the salaries of the three top key personnel in Roane-Anderson.

Senator HICKENLOOPER. Do you have any reimbursable salaries to Roane-Anderson in that general area of \$8,000 and above?

Mr. COOK. Yes, we do, sir.

Senator HICKENLOOPER. How many of those?

Mr. COOK. I will have to check them. I may have them.

Senator HICKENLOOPER. Are they supervising architects or project subcontractors?

Mr. COOK. No, sir. I can give you the general classification. They are generally division and department heads.

Senator HICKENLOOPER. Can you give me the number of those?

Mr. COOK. Would you prefer a break-down by salary ranges?

Senator HICKENLOOPER. Well, give it to me as clearly as you can. I am not particularly interested in the names of the individuals for

this purpose. I want to know the salaries that are paid and the duties. That is, salaries in a supervisory or executive capacity.

Mr. COOK. Well, \$700 per month or \$8,400 per year and above—we have a total of four people.

Senator HICKENLOOPER. How many do you have above \$8,400 and what are those salaries? These are the reimbursable items. I am not concerned with what the New York office pays its officials back there, but I am interested in the reimbursable items by the Government.

Mr. COOK. That is right. Above \$8,400 per year, sir, there are only four people.

Senator HICKENLOOPER. Four above?

Mr. COOK. That is right.

Senator HICKENLOOPER. And what are those salaries above \$8,400 a year?

Mr. COOK. I have given you the names of three of them.

Senator HICKENLOOPER. Yes.

Mr. COOK. And the other one is Mr. W. C. Taylor. He is \$8,820 per year. He is the manager of the housing division.

From \$600, or \$7,200 per year, to \$700 per month, there is a total of 11.

Senator HICKENLOOPER. Eleven at \$7,200?

Mr. COOK. From 600 to 700 dollars a month, or from \$7,200 per year to \$8,400 per year, there is a total of 11.

Senator HICKENLOOPER. Now, what totals do you have in the bracket that would be just below that?

Mr. COOK. From \$6,000 to \$7,200 per year there are 12.

Senator HICKENLOOPER. I think we do not need to break them down lower than that.

Now, I made a little investigation over the week end of my own home town of Cedar Rapids, Iowa, which is quite a well-run town and which is a town of 76,000 people. There are some interesting comparisons as to the number of people in town administration, airport employees, public improvements, such as sidewalks, sewage disposal, streets, and maintenance department; the board of health includes garbage disposal and incinerator operation; city waterworks, parks. There is the arborist's department, recreation field, the fire department, the police department, the memorial coliseum and stadium employment and public libraries. That town of 76,000 people operates that city with 517 employees, and that includes 90 policemen.

I call that in contrast to the 1,500 employees in a town of 8,400 at Los Alamos who devote themselves to town operation as distinct from production operation; and I call that in contrast to the operation of town facilities at Oak Ridge.

The total operating budget of that city of 76,000 people, exclusive of interest on any bonds that they may have, the current operating budget is \$2,092,801.45.

Pride in my home town would force me to say that I think it is a very well run city. It is efficiently run, it is clean, its services are good.

Now, I want a little further, because they do not do electrical work for the houses and they do not do plumbing for the private residences, but in that city there are 59 licensed plumbers who take care of all the plumbing for that city. They are privately hired, of course, by the householders. There are 14 electrical contractors with an estimated

number of not more than five electricians per contractor, which would make about 70. So, it might be fair to add to this list 129 plumbers and electrical contractors.

But by the same token we would have to take off 90 of the police department, because in these town operations the guard force—with the exception of Oak Ridge, and I think you have a police department in Oak Ridge, but in Los Alamos the guard situation is taken care of by a separate budget. So, if we took the police out of this town, it would reduce the number by 90 employees. I merely put that in for the record.

Now, I would like to go on, if I may.

Mr. Cook. Senator, we only have 495 people in the town activities. The police force for the town of Oak Ridge has nothing to do whatsoever with the control and guarding of the controlled area surrounding the plants.

Senator HICKENLOOPER. I understand. I said "with the exception of Oak Ridge," which has a police department for the town activities. I understand that. The Roane-Anderson Co. operates the police department for town activities, does it not?

Mr. Cook. That is right, but in comparison of some of our activities with a recent survey made by the firm of J. L. Jacobs, of Chicago, the number of employees in our municipal activities is not unreasonably out of line. In fact, it is less than a considerable number of communities.

Senator HICKENLOOPER. Now, I would like to go on and talk about the bus company down there.

Senator MILLIKIN. May I ask a question?

The CHAIRMAN. Certainly.

Senator MILLIKIN. Who is on the staff of the Roane-Anderson Co. giving continuous attention to the Roane-Anderson contract at Oak Ridge whose salary is not reimbursable?

Mr. Cook. Who is on the staff—would you repeat that, sir?

Senator MILLIKIN. Who is on the staff of the Roane-Anderson Co. at Oak Ridge whose services are not reimbursable?

Mr. Cook. There is no full-time man at Oak Ridge whose services are not reimbursable. However, Mr. Clinton Hernandez is the off-area project manager of the Turner Construction Co., who spends a considerable amount of his time at Oak Ridge.

Senator MILLIKIN. All representatives of the Roane-Anderson Co. at Oak Ridge who give their continuous attention there, their salaries are reimbursed?

Mr. Cook. That is right, sir.

Senator MILLIKIN. There are roving representatives of the company who come out and supervise the situation?

Mr. Cook. Quite often, depending upon the needs for services from the parent corporation, whether they are legal, industrial relations, accounting, or just periodic inspection, we have people out from the New York office to assist in the operations at Oak Ridge. All costs pertaining to that work which they do at Oak Ridge comes out of their fee. It is nonreimbursable.

Senator MILLIKIN. So that the Oak Ridge company gets roughly \$200,000 a year plus these possible extras for that roving supervision?

Mr. Cook. Well, sir, the Turner Construction Co. has a total of 21

people furnished by the parent organization who are in key supervisory capacities in the work at Oak Ridge: 17 of those people came directly from the Turner Construction Co., 4 of them came from jobs with Turner, worked with another firm on a joint venture.

That is a part of the reason why we pay a fee, because we obtained these key people from this parent organization, who, if they were not assigned to Oak Ridge, would be working on some other work of the Turner Construction Co. where the company would expect to earn a profit.

Senator MILLIKIN. That is a sort of employment agency fee, as it were?

Mr. Cook. Sir?

Senator MILLIKIN. That is comparable to an employment agency fee. You pay this outfit a certain amount of money because they supply you with a type of person which you want and which you proceed to put on the Commission's pay roll.

Mr. Cook. No, sir; it is really a management fee.

Senator MILLIKIN. I mean, in terms of reimbursability.

Mr. Cook. It is really a management fee, and by reason of the various type of operations there, the closest comparison that we can make to the Roane-Anderson operation is to a construction contract, and a fee that you would pay for a construction job.

We have carefully reviewed the various activities that they perform, and we relate those activities to the complexity in comparison to a construction job.

Senator HICKENLOOPER. At that point, in 1948 under this main contract there were some \$15,770,000 worth of work performed or done under the contract, and the fee was \$192,000. In 1949 there were \$5,899,000 of this work, and the fee was \$192,000. In 1950, there is estimated to be \$7,761,000 worth of work, and the fee is \$192,000.

So that it seems that the fee is just simply a fixed, rigid fee, irrespective of the amount of work that is involved.

Mr. Cook. Those figures do not check with mine, Senator; but I might point out that, if you allow me to continue on this, their budget last year was approximately \$17,000,000.

Senator HICKENLOOPER. I am reading from the statistics developed by the joint committee, and on this mimeographed sheet here, which says:

The amount obligated under total contract, 1948, \$15,770,000; 1949, \$5,889,000; and the fiscal year 1950, \$7,761,131.

Mr. Cook. The amount of the obligation has nothing to do with the cost of operation or cash expenditures under the contract. That is one of the difficulties we have ourselves in budget procedures.

Senator HICKENLOOPER. The whole story adds up to this.

Mr. Cook. Let me give you these figures, sir. In 1947 they had cash expenditures under their contract of \$13,000,000 and cash revenue of \$6,300,000. In 1948, they had a cash expenditure of \$14,900,000, and a cash revenue of \$6,700,000. In 1949, using the first 11 months of operation extended, they will have a cash expenditure of \$15,000,000, and a cash revenue of \$6,400,000. Our estimated cash expenditure for 1950 is \$16,100,000, and our revenue is \$6,400,000.

Senator HICKENLOOPER. Do you make that up of the following items? I do not know that I can follow that on this sheet.

Amount obligated under total contract, 1948, is \$15,770,000; maintenance of production and research facilities, \$492,748; maintenance and operation of towns, \$9,395,938; maintenance of AEC administrative facilities, \$1,926,522; construction, \$3,762,792.

Is that the general total that you are referring to?

Mr. COOK. You have a budget break-down, sir, and I have a cost break-down. I do not think we will be able to reconcile the two. I would be glad to look up the budget break-down.

Senator HICKENLOOPER. That has been one of the difficulties, to reconcile the costs and budgets.

I would like to go on.

Senator MILLIKIN. I wonder if I could get a clinch on my line of inquiry.

Senator HICKENLOOPER. Certainly.

Senator MILLIKIN. Is it correct that there is no member of the Roane-Anderson Co. who gives his continuous attention to this operation on the ground at the expense of the Roane-Anderson Co.?

Mr. COOK. That is right, sir. However, when we calculate the fee for the Roane-Anderson Co., if they do not provide a full-time non-reimbursable representative, we deduct that man's salary from the fee that we pay. So they have, in effect, a nonreimbursable representative on the job.

Senator MILLIKIN. After you get through with that, you still pay them \$192,000 a year?

Mr. COOK. That is right. If they had a nonreimbursable man, we would pay them \$12,000 a year more.

Senator MILLIKIN. All of the men who have come from the Roane-Anderson organization and who give their continuous attention to the operations there are on a reimbursable basis; is that correct?

Mr. COOK. They are, sir.

Senator MILLIKIN. Thank you.

Mr. DURHAM. Is the yearly budget prepared in the home office or is it prepared in Oak Ridge?

Mr. COOK. Is our budget prepared in the home office or at Oak Ridge?

Mr. DURHAM. Yes.

Mr. COOK. It is prepared in Oak Ridge, sir. It is developed as the result of cost data and developed by the operating contractors and the AEC representatives, who are responsible for the administration of those contracts.

Senator MILLIKIN. Mr. Chairman, I would like to ask one more question. What services does the Roane-Anderson Co. provide from its New York headquarters or from any headquarters any place that is not reimbursable?

Mr. COOK. They provide service, legal services, they provide assistance in accounting, they provide assistance when necessary in industrial relations, they provide assistance in preparation and review, primarily review, of plans and specifications, review of contract forms, establishment of operating policy—all those things and many others are provided by the New York office from time to time as services are necessary, without reimbursement.

Senator MILLIKIN. Somewhat similar to the operations of a holding company.

Mr. COOK. That is right.

Senator MILLIKIN. So far as its subsidiaries are concerned.

Mr. COOK. That is right, sir, but I would like to complete this as to the fee. Using an estimated cost of construction of \$15,000,000, and making the corrections for the type of work there performed, apply it to the construction fee schedule, it results in an average yearly job of approximately \$10,000,000.

Under other Government construction fee schedules the contractor would be entitled to a fee of  $2\frac{1}{2}$  percent or \$261,000.

In addition, realty management revenue of \$6,450,000 per year would entitle a realty management company to a fee of 1 percent of that total, or \$64,500.

So, if we followed normal Government practice and normal realty management practice, they would be entitled to a fee of \$261,000 plus \$64,500, or \$325,000; and they are receiving a fee of \$192,000.

Senator MILLIKIN. Why pay the fee at all? Why not run the business without the fee?

Mr. COOK. We feel that after giving it considerable study and thought that it is more economical to the Government to operate with a contractor whose whole history and background is on the incentive competitive basis.

We feel that when we pay a fee which is in reality a profit to the contractor, that we can demand the same type of aggressive, economical operation in our work as he provides in his own.

Senator MILLIKIN. I suggest that as to a fixed fee, the implication in many aspects are to the contrary.

Senator HICKENLOOPER. On that point, may I say this?

Senator MILLIKIN. The great criticism of fixed fee is that it leads to carelessness in costs. I would like to—

Mr. COOK. Sir, may I add something here before we go from that operation? I think that our experience has been that we can, with a good cost-plus-fixed-fee type contract on a continuing basis with proper support and supervision by the Commission and proper cooperation with the contractor, do our work much more efficiently by that method than we can any other method.

It has many advantages that are not apparent, and are not real in direct Government operation.

Now, in the community operation total employment in community operation activity has been cut 40 percent since December 31, 1946. These major reductions are reflected both by the Commission and a majority of the principal contractors.

Senator MILLIKIN. Of course, they obviously should, because you finished your great surge by 1946. Is that not correct?

Mr. COOK. We finished it before that, sir, but in December, 1946—well, that is December 31, 1946, and that is January 1, 1947 when the Commission took over. At one time during the peak of Roane-Anderson's employment in 1944, the fall of 1944, they had 10,000 employees on the pay roll.

Senator MILLIKIN. That is what I am saying, the diminution of work there, except for—unless you are going to assume imbecility in procedures, would call for reduction in pay roll.

Mr. COOK. No; I am trying to show you here that since January 1, 1947, we have made rapid strides and rapid improvement in our operation down there.

For instance, since July 1, 1948, Roane-Anderson's pay roll has dropped from 3,192 to 1,589, or 50 percent.

American Industrial Transit Co. has decreased from 430 to 296 or 31 percent; municipal employees paid through Roane-Anderson have fallen from 508 to 305 or 39 percent, and the AEC's community operation pay roll has decreased from 196 to 71, or 64 percent.

Senator MILLIKIN. How much did the total expenditure program at Oak Ridge drop from 1944, say, to 1948?

Mr. COOK. 1944 to 1948?

Senator MILLIKIN: Yes, or take any—

Mr. COOK. It is not a true comparison, sir. I would rather give you a figure—

Senator MILLIKIN. Give me that comparison and let me judge whether it is sound.

Mr. COOK. Our expenditures for the fiscal year 1950 for the operation of the plants and the town and the Commission pay roll, just for operation, leaving out capital construction costs, will be in excess of \$30,000,000 a year less than it was in the fiscal year 1947, and we are essentially doing more work and producing more material.

Senator MILLIKIN. What were the total expenditures at Oak Ridge in 1944.

Mr. COOK. I do not have the total expenditures including construction with me, sir, but—

Senator MILLIKIN. Several times larger than at the present time?

Mr. COOK. That is right, sir; and they produced less material at that time.

Senator MILLIKIN. I want to get a little sharper focus on this subcontracting business. That authority to subcontract is limited to what field?

Mr. COOK. The authority to subcontract with Roane-Anderson?

Senator MILLIKIN. Yes. Senator Hickenlooper developed what you call modification 20; is that right?

Mr. COOK. Yes, sir; that is a provision in the contract which enables Roane-Anderson Co. to act as an agent for the Commission in subcontracting certain types of construction work.

Senator MILLIKIN. That is what I am getting at. What are these types of work where that is applicable?

Mr. COOK. There will be additions and extensions to existing utilities, renovation and remodeling of existing buildings, minor construction work; all of the major construction work will still be on a direct prime contract with the Commission.

Senator MILLIKIN. Why the necessity for subcontracting in such minor field?

Mr. COOK. By that method we believe that we can save the Government money, sir. It provides a steady work load for the engineering department of the Roane-Anderson Co. throughout the year, and it enables the Commission to reduce its personnel which otherwise might duplicate those functions. We still will continue to have plans and specifications prepared for major construction work by architect-engineers, and they will be advertised and awarded—awards will be made on a lump-sum basis.

We have done that all through the years, and we will continue to do that, but those major contracts will still be prime contracts with the Commission.

Mr. HINSHAW. Mr. Chairman.

The CHAIRMAN. Mr. Hinshaw.

Mr. HINSHAW. I would like to ask the gentleman how many employees of the Commission are employed in the supervision and auditing of the Roane-Anderson Co., supervising the work of the Roane-Anderson Co.?

Mr. COOK. Well, in the Office of Community Affairs, we have a total of—

The CHAIRMAN. Three hundred and twenty-one, was it not?

Mr. COOK. No, sir, no, sir. We had a total of 71 people, and they are broken down roughly as follows: There are 39 assigned to municipal activities, 5 assigned to utilities; 14 to real estate, and 13 to construction.

Mr. HINSHAW. Does that include the auditors?

Mr. COOK. That does not include the auditors. All of the auditing at Oak Ridge is handled by a separate office called the Office of Fiscal Affairs, and under the director of finance, who does the auditing of all of the cost-plus-fixed-fee contracts administered by Oak Ridge.

Mr. HINSHAW. How many direct employees would the administrative side of the AEC employ at Oak Ridge?

Mr. COOK. We have a total now of approximately—the last figure I had was 998 employees on the AEC pay roll at Oak Ridge, as compared with 2,500 employees on January 1, 1947.

Mr. HINSHAW. Those are divided, I presume, between such employees as are engaged in what might be termed monitoring the contractors inside the barrier and those that are engaged in outside work; is that correct?

Mr. COOK. That is right, sir. I have a break-down here, I think, that will give you a good picture of it.

On April 30 of 1949—I have a break-down as of that date, and at that time it totaled 1,071. We have since come below the thousand mark. We had 12 people in the manager's office; Office of Public Information, 3; assistant general counsel, 34; Isotopes Division, which performs a Nation-wide service, 44.

Senator HICKENLOOPER. Assistant general counsel, 34. Does that mean lawyers?

Mr. COOK. Not all lawyers, sir. That is the total employment in the assistant general counsel's office.

Senator HICKENLOOPER. How many lawyers do you have down there?

Mr. VOLPE. Ten.

Senator HICKENLOOPER. Why do you need 10 lawyers at Oak Ridge?

Mr. COOK. Well, in the transition from the former type of operation to the present type of operation, and in trying to revise the old policies and the old contracts to conform with our present desires of operation and in working on long-term leases, incorporation of the town, sale of property, all of these other things that are necessary before we can revert to a normal community, we need legal services.

Those boys are—the 10 that we have down there—worked to the limit; in fact, they worked all last week end getting some contracts out prior to the end of the fiscal year.

Senator MILLIKIN. Is the pay reimbursable?

Mr. COOK. The lawyers that I am talking about, sir, are on the Commission staff.

Senator MILLIKIN. And still you have to call in these fellows from the Turner outfit in New York to give you additional legal advice?

Mr. COOK. No, sir, they give legal advice to the Roane-Anderson Co.

Senator MILLIKIN. It takes nine tailors to make a man, but how many lawyers does it take to keep you fellows going? [Laughter.]

Mr. COOK. Well, at times we have need for more than we have, sir, when you take our total work load as a total. We have over 2,000 contracts down there.

In the Security Division, we have 285 people.

Now, approximately 156 of those are the guards who guard the new controlled area, and 66 of those are shipment security. Those are primarily operating functions.

In our Office of Fiscal Affairs we have 377 people. The Office of Fiscal Affairs includes the director of finance, the Supply Division, the Reports and Statistics, and the Budget Office.

In the Office of Engineering and Production we have 141 people; in the Dayton area we have 24 people; in the Office of Research and Medicine we have 27 people, and in the Office of Community Affairs, 67.

Mr. DURHAM. What do you mean by "27," 27 doctors?

Mr. COOK. Oh, no, sir. It is the Office of Research and Medicine—Medicine and Biology. We have two doctors in the division. The Chief is Dr. Holland, who is an M. D.

Mr. DURHAM. They are in the research end. I thought you meant to service the outside personnel.

Mr. COOK. No, sir. The Oak Ridge Hospital now is run by a non-profit corporation.

Mr. DURHAM. I see.

Mr. COOK. Chartered in the State of Tennessee.

Mr. HINSHAW. Mr. Chairman, I was particularly interested in the break-down or the division, if that is possible, between those who conduct affairs behind the barricade and those who conduct affairs related to the management of the town project, and all affairs outside of the barricade. I do not know whether that can be given offhand. The gentleman has quoted the total figures and included in those figures those in both places.

Mr. COOK. At the present time, as far as our operation, our production, and our research are concerned, we have no Commission employees full time in the controlled area except for major construction projects.

At the Oak Ridge National Laboratory, where we have a major construction program going on or about to be initiated, we have what we call a residence engineer. We have a direct prime contract with the architect-engineer, and the construction contractor, and he is a full-time representative of the Commission and in responsible charge of the construction and engineering work at that site.

We have another site at K-25, where we hope to initiate another construction program the first of the fiscal year, and we will hire a full-time resident engineer with a nucleus staff enough to handle the Commission's responsibility in regard to that work.

The other people are all on the outside of those at Dayton, and some of our off-area activities are in the town site proper itself.

The Office of Community Affairs is housed in the municipal building, and the rest of the Commission's personnel, outside of the guard

force, are housed in the administration building on the hill, but we have constant contact with the operating people, with the Oak Ridge National Laboratory, by periodic visits to each plant and reviewing with them their work and their programs.

Mr. HINSHAW. I appreciate the operations in connection with the National Laboratory. I was thinking particularly of the operation of the town site and the number of auditors and others who were required to supervise and oversee the work of the Roane-Anderson Co. and provide such cooperative services as may be needed between the Commission and the Roane-Anderson Co.

Mr. Cook. Well, I do not have those figures broken down, sir, but I can get them.

The director of finance is responsible for the audit of not only the Roane-Anderson Co. but the Carbide & Chemical Co., the Austin Co., all the cost-plus-fixed-fee contracts we have at Oak Ridge, including our off-site activities at Dayton and Marion.

Now, I could give a guess as to the total of how many man-hours are spent at Roane-Anderson, but I would rather do a little figuring on it before I gave it to you.

Mr. HINSHAW. Well, obviously, you must audit all of the bills of the Roane-Anderson Co. that are chargeable to the Commission.

Mr. Cook. That is right.

Mr. HINSHAW. And supervise the work of the Roane-Anderson Co. to make certain that the expenditures are within the contract and that they are right and equitable and just for the Government to pay.

I assume that you have quite a force that is supervising that work, in auditing and also in inspection and supervision.

Mr. WILSON. Mr. Hinshaw, we have this Office of Fiscal Affairs with the director of finance who handles those functions, fiscal functions, audit functions, for all of the operations which Oak Ridge carries on. It's more efficient to have a single unit performing the same operations for all. We could break up by an estimate by man-hours on Roane-Anderson supervision, but I think you will see why it is more economical to have a single fiscal division handling those functions for all contracts at Oak Ridge.

Mr. HINSHAW. I would imagine so. I was just assuming that some 200 or 300 people were engaged in supervising the work at Roane-Anderson Co. in one way or another, and in cooperating.

Mr. Cook. No; that is not right, sir. The total and the number of the people in the Office of the Director of Community Affairs, plus a certain portion of the time of the finance division, the director of finance—sufficient time for his people to review all of their fiscal operations. Now, I can give you an approximate figure on that. We would have to apply their time to all of our major cost-plus-fixed-fee contractors and try to arrive at a prorated basis.

Mr. HINSHAW. I would not want to put you to the expense or the trouble of auditing your own figures to state exactly what it was, but a good guess would be interesting, I think, to the committee.

Mr. Cook. I am sorry, sir, I did not catch your last question.

The CHAIRMAN. He said to guess at it.

Mr. HINSHAW. A good guess would be interesting to the committee as to how many were involved outside the barricade, what proportion outside the barricade, and what proportion within the nine-hundred-

odd people that you mentioned a moment ago as being Commission employees in that area.

Mr. COOK. All right. Of the total—

Senator HICKENLOOPER. Mr. Chairman, I have quite a number of items I would like to get before the committee this morning. I wonder if Mr. Hinshaw would put those figures in later. They apparently are somewhat confused on this at the moment, and we ought to give them a chance to straighten themselves out.

Mr. HINSHAW. That is agreeable to me and, Mr. Chairman, I have a little matter in connection with the pipe line that I would like to bring up before we are through with this.

The CHAIRMAN. Well, you certainly will have an opportunity, Mr. Hinshaw.

Senator HICKENLOOPER. If I may proceed, I would like to talk about this streetcar operation. It is the same as the Roane-Anderson. Would you mind, Mr. Hinshaw, if I spoke about that? I would like to go into the matter of the American Transit Bus contract down there at Oak Ridge.

My information is that its full operations are completely reimbursable by the Atomic Energy Commission; they buy all the tires, gasoline, and busses, and pay all the salaries, and then, when they get all through they pay the American Transit Bus Co. \$90,000 a year just as a fee on top of full reimbursement. Is that correct?

Mr. COOK. That is not right, sir.

Senator HICKENLOOPER. Well, where is it wrong?

Mr. COOK. The A. I. T. Bus Co. receives a fee of \$90,000 per year. However, for that fee, they are required to furnish five non-reimbursable representatives under the terms of their contract.

Senator HICKENLOOPER. Full time?

Mr. COOK. Full time; and they have, in fact, furnished six; so what you have is a contract where six members of the firm serve full time on a nonreimbursable basis.

Senator HICKENLOOPER. I see.

During the last year, fiscal 1949, they lost \$455,812; did they not?

Mr. COOK. I can give you an analysis of their operating costs.

Senator HICKENLOOPER. I am not concerned with an analysis of their operating expenses. Just how much did they lose? Can we not get down to some over-all figures here on this operation? The information that I believe has been testified to before some other committees here is that they lost a gross total of \$455,812 in fiscal 1949, and that the Commission anticipates that they will lose \$354,656 in 1950, fiscal 1950.

Now, I understand that that \$90,000 is largely for what they call know-how. That seems to be a common term that developed, and I just wonder if it is know-how to lose a half million dollars a year in the operation of a bus system, or what the purpose of that \$90,000 fee is, with a full reimbursable contract.

Mr. WILLIAMS. Well, the bus system at Oak Ridge serves not only the town of Oak Ridge, but it is used to transport workers to the plants.

Senator HICKENLOOPER. Yes.

Mr. WILLIAMS. We have one plant there that is—

Senator HICKENLOOPER. Just a moment, please. What is the fare? That is 10 cents for the people in the town; it is not?

Mr. WILLIAMS. That is right.

Senator HICKENLOOPER. And it is 15 cents for the workers in the plants who use it; is that correct?

Mr. WILLIAMS. That is correct.

Senator HICKENLOOPER. Do you know how many passenger fares per year that bus system runs in Oak Ridge?

Mr. COOK. 550 passengers per year.

Senator HICKENLOOPER. 550 per year? There should be a few more.

Mr. COOK. I mean 550,000 passengers a year.

Senator HICKENLOOPER. 550,000 paid fares per year?

Mr. COOK. No; I am wrong Senator; it is 350,000 miles per month, transporting approximately 550,000 passengers per month.

Senator HICKENLOOPER. Somewhere around 6,000,000 passenger fares per year, close to 7,000,000.

Mr. WILLIAMS. About six million six.

Mr. COOK. That is right.

Senator HICKENLOOPER. About six million six?

Mr. COOK. That is right.

Senator HICKENLOOPER. What possible reason could there be for paying this company \$90,000 a year for operating this bus company? I mean, why not save that amount of money?

Mr. COOK. They are not paid \$90,000 a year for operating the bus company.

Senator HICKENLOOPER. I mean what are they paid that amount for? What is the purpose of it? It has been testified to, I believe, by Mr. Wilson that that is paid for know-how.

Mr. COOK. The \$90,000, if you make the correction for the salaries paid the nonreimbursable representatives, results in a figure of a net fee of approximately \$39,000 a year. That fee we pay for the operating know-how of the bus company, and I have a statement here which I would like to read, to give you the background of the bus company, the type of operation, the difficulties of operation which, I am sure, will answer the questions that you are prepared to raise.

May I read that, Mr. Chairman.

Senator HICKENLOOPER. How long a statement is it? I have a number of things I would like to get before the committee here for discussion, and perhaps, we can discuss them later. If we read long statements about the history of these things every time an issue is raised, we will be here all summer.

Mr. COOK. This is a short statement, and will give you a brief outline of the bus operation.

The bus-transportation system, operated by the American Industrial Transit, Inc., on a fixed-fee basis, furnishes normal city bus service within the city of Oak Ridge and also between the city and the three major research and production areas. Functionally, the operation consists of five interrelated systems:

A perimeter express system originating in the residential area and running directly to the electromagnetic-process plant and to the diffusion-process plant.

Two, a loop express system originating in the residential area and running directly to the National Laboratories.

Three, a system originating at the central terminal in the city running on local schedules to the two production plants and the Oak Ridge National Laboratory.

Four, a residential system connecting the main thoroughfares throughout the residential area with the various shopping centers and the central terminal.

Five, a school system supplying service for approximately 7,000 pupils at 10 schools. The bus system as a whole traverses approximately 350,000 miles per month, transporting approximately 550,000 passengers.

The present fare structure, instituted on July 1, 1948, is basically a 10-cent cash fare for all local runs and 15 cents cash fare for express runs.

Since August 1944 the rates for all types of service, except school runs, had been a 10-cent cash fare or a token purchasable for 6 cents. Even under the present fare structure revenue offsets less than half of the operating cost. This fact, together with unique conditions, makes it necessary for the Government to absorb the operating loss or to accept the alternative of facing wage demands which would result from the imposition of fares which would eliminate the existing subsidy.

The Oak Ridge residential area is a narrow and attenuated district located on a hillside, covering about 8 square miles. The streets are winding and irregular in lay-out, conforming to the terrain of the land. Roads and lanes occupy ridges, with residences on one or both sides.

Most avenues running north and south ascend relatively step grades, and the land between is of such rugged character that it cannot feasibly be used for building. Therefore, there are no east and west roads connecting with the avenues.

This condition requires more transportation service than would be necessary in a city with orthodox street patterns.

The unique nature of the Oak Ridge project, which caused the research and production to be placed in widely separately areas so as to reduce the hazards inherent in the project, required the establishment of bus transportation running far from the residential center.

The three principal operating areas are 4, 11, and 13 miles, respectively, from the center of the city.

Between the residential area and the plant areas there is no population concentration, and the entire distance is totally unproductive of passenger traffic.

Senator HICKENLOOPER. That is the area where you run the express busses on the trip from downtown out to the plants; is it not?

Mr. Cook. There are some express busses, sir, that run from the town to the plants, but most of the service from the town to the plants is through the bus terminal, and a person can get on at a bus stop near his home, transfer at the bus terminal, and ride out to the plant for 10 cents.

Senator HICKENLOOPER. I thought that was a 15-cent run?

Mr. Cook. No, sir; only on the express busses that do not stop at the terminal. If a person wants to ride on that, he can.

In a normal bus operation the revenue per mile of line is in direct ratio to the density of population per mile of line.

In 28 cities, selected at random, of comparable population, the average population per mile of line is 1,943 persons.

In the Oak Ridge area the population per mile of line is 135 persons, and in the city of Oak Ridge, the most densely populated part of the Oak Ridge area, the population is only 435 persons, or 22 percent of the average of the 28 cities.

Most bus operations have two peak- or rush-hour-load periods during the day, usually 7 to 8 a. m. and 4 to 5 p. m. During these peaks, in the usual operation approximately twice as much equipment and manpower is required as during other base periods throughout the day. In Oak Ridge, because of the long distances between the industrial and plant areas, approximately four times as much equipment is required during the two daily peaks as during the remainder of the day.

The need for busses is naturally greatly reduced between the peak hours, but experience has clearly demonstrated the necessity of retaining a certain number of drivers, who are union members, on call between the peak hours; otherwise, as has been shown, the drivers necessary for the operation cannot be recruited and retained.

However, the most recently negotiated union contract permits retention for a 12-hour period with actual wage payments being made for only 8 hours, compared with much less favorable terms under the previous agreement.

The institution of a school-bus system has helped reduce the lag between the peak loads and has assisted in the rescheduling of runs to further utilize the services of the drivers on duty. Schedules are being analyzed and revised continually with a view to further reduction in operating costs to result in the lowest possible operating deficit.

During the summer of 1944 it became apparent that bus operations had grown to a magnitude requiring the management by a separate contractor with special abilities in transportation management.

It was impossible to go out and hire people from various transit companies throughout the Nation, so negotiations were had and culminated in a contract whereby the American Industrial Transit, a partnership, assumed management in February 1945.

All of their key people at that time came from the Southeastern Greyhound Lines and other lines that operated in the South.

This organization established the Interstate Commerce Commission uniform system of accounting, in which the cost per mile is the basis of operating cost accounting.

The peak of operation was reached in August 1945, when 420 busses, covering 828,000 miles and transporting 2,434,000 passengers during the month, were in use.

Since that time, through consistent effort, economies were effected, until to date the bus system involves approximately 135 busses, covering approximately 350,000 miles and transporting approximately 550,000 passengers per month.

The deficiencies in revenue, and not the cost of operation per mile, are obviously responsible for the net operating loss of the system because, in spite of the obstacles confronting an economical operation, the cost per mile of operation of the Oak Ridge system was 37.5 cents, and the national average was 44 cents per mile during the first quarter of calendar year 1948; revenue per mile in Oak Ridge is approximately 1.66—2.99 in the city and 0.99 on plant runs.

In comparing Oak Ridge system costs, it should be understood that the national average of 44 cents per mile includes approximately 2 cents

for taxes and license fees. But even on that basis our operating costs are still good.

Sometime ago, I think it was in the fall of 1947, the Commission engaged the consultant firm of Simpson & Curtin, transportation engineers of Philadelphia, to analyze the operation and to recommend steps to improve operational efficiency of the system and to reduce its cost.

Simpson & Curtin were able to conclude only that the unique character of the service required, plus the abnormal features of terrain, precluded a profitable operation.

Their conclusion was that the system was being operated with almost maximum efficiency and economy possible under the circumstances.

Senator HICKENLOOPER. What is the salary of the general manager of the bus company that is reimbursable by the Government?

Mr. COOK. The salary of the general manager of the bus company is not reimbursable by the Government.

Senator HICKENLOOPER. Does he spend his full time there?

Mr. COOK. He spends his full time there.

Senator HICKENLOOPER. What are the top salaries reimbursable by the Government, the top salaries of the bus company?

Mr. COOK. The only one I have listed, sir, is, first, six key people of the A. I. T. Co. are nonreimbursable; the next man, the next reimbursable man, is the superintendent of safety and training. He is \$5,400.

Senator HICKENLOOPER. That is the highest salary that you reimburse; is that it, of the bus company?

Mr. COOK. That is the way this was prepared; yes, sir.

Senator HICKENLOOPER. All right.

Now, I would like to talk about some more commonplace things than these complicated operations.

I recall last year that there was an item in the budget to which considerable objection was raised of \$346,000 put into the garbage-can bases in about 3,000-some houses in Oak Ridge.

Can you tell us anything about what has happened to that? I think that figured out about \$90 a slab for cement slabs for garbage-can bases. Do you have any information on what has happened there?

Mr. COOK. I think I have, sir. That estimate that you have there, I think, was an estimate made on approximately 10,000 housing units existing at that time.

Senator HICKENLOOPER. No; I beg your pardon. The estimate was made on about 36 or 37 hundred houses, according to the record. The amount was \$346,000. It came up at a hearing of the joint committee, and at that time it was admitted that it figured out close to about \$100 for each cement slab for the setting of garbage cans. That did not include a nice picket fence around the slab, but it has happened there. Have they installed the slabs?

Mr. COOK. On the Cemesto-type housing, which is referred to often as the permanent-type housing; the program did go through for the majority of the Cemesto-type housing of providing a slab for the garbage cans to rest on, and a picket fence to screen the garbage cans from the road.

Senator HICKENLOOPER. How large is that slab, do you know?

Mr. COOK. The slabs were precast, and I would guess the slabs were about 2 feet square, 2½ feet square; but that program—

Senator HICKENLOOPER. But that item was costing a hundred dollars per slab. I think maybe it was contemplated that two cans would go on a slab, and that would mean two slabs.

Mr. Cook. There was one can for each slab, that is right.

Senator HICKENLOOPER. But 2 feet square would hardly take the two cans. The information we got was that this approximately \$100 per slab meant a slab that would hold a precast slab that would hold two garbage cans.

Mr. Cook. We are not able to locate any figures on that, sir. What I would like to do is to obtain the exact costs. I do recall that the plan was not carried out as originally programmed.

Senator HICKENLOOPER. Well, in the budget it contained an item of \$346,000. I remember distinctly that Mr. Franklin stated that that was for about 3,700 or 3,800 of these garbage can slabs that would hold two garbage cans.

We estimated that they would be about 6 feet long and 3 feet wide. I see they are a little narrower than that, and probably 6 inches thick, and I went to some trouble to find out what cement of that kind would cost.

I find that you can get—that would be about a third of a cubic yard at that rate—a half of a cubic yard of ready-mix cement delivered here in Washington at retail, just a half a cubic yard, for \$9. It would mean that a third of a cubic yard, going into a slab of this kind, that would hold two garbage cans, should not cost more than \$6 at retail delivered here in Washington, and the fantastic figure of close to \$100 for these slabs was, I know at that time and still is, so far as I am concerned, unbelievable.

Mr. Cook. Well, those slabs did not cost that much.

As I recall the figures, and I would like to check them, I think our total cost for the installation of the enclosures and the slabs was around \$118,000.

Senator HICKENLOOPER. That is what I am inquiring about.

Mr. Cook. I do not recall the exact figure. I would like to check it.

Senator HICKENLOOPER. That still would be on the basis of 35 or 36 hundred houses, which was the amount testified to last year, would still be in the neighborhood of \$50, and certainly these, casting that number—that is, precast slabs, and hauling them up and just setting them on the premises would seem to be an outlandish figure.

The CHAIRMAN. It would come to about \$34 apiece, Senator; \$118,000 divided by 3,600 come to about \$34 apiece.

Mr. Cook. That is right; it is a little over \$30 apiece, but that \$34 included not only the slabs, but it included the picket fence that shielded the garbage cans from the road. I think that is a very reasonable price, at \$30 each.

Senator HICKENLOOPER. I would certainly like to be able to have a contract in numbers on that price from the calculations or figures that I get on ready-made picket fences that you can buy per foot, and for what you can get retail—you can get cement mixed and delivered here in Washington in half-yard quantities.

Mr. Cook. In addition to the price of cement delivered, you have to have skilled workmen there to place it, to finish it.

Senator HICKENLOOPER. No; these are precast.

Mr. Cook. I know.

Senator HICKENLOOPER. These are cast at a central place.

Mr. Cook. That is right. But all you have is the cost of your material. You do not have the cost of your forms, you do not have the cost of finishing, the cost of transportation, the cost of laying.

Senator HICKENLOOPER. I am talking about a——

Mr. Cook. You just cannot go on material costs alone. Your material costs are generally only 50 percent of your total construction costs.

Senator HICKENLOOPER. I am talking about a price at retail of a third of a cubic yard delivered in Washington of mixed cement. Now, that means they will load a third—they will deliver a half a cubic yard, the smallest amount they will deliver, but they will deliver it, they say, any place in Washington, a half of a cubic yard of mixed cement for \$9.

Now, a slab of 6 feet long and 3 feet wide and 6 inches thick which, I would just guess, would be about the size, although that is much bigger than the 2 by 2 or 2½ by 2 slabs that you mentioned, certainly if that can be done at retail in individual lots here in Washington, then anyone who has a contract or undertakes to cast those in thousands at a central location and merely take them out and put them properly on the ground——

Mr. Cook. That price provides for the grading of the ground, the placing of a crushed-rock drainage base under it; it provides for 4 by 4 posts, 2 by 4 rails, and 1 by 4 pickets. It provides for painting. You do not get that for any less.

Senator HICKENLOOPER. It does not have chrome knobs on top of the picket fences, does it? It would seem to me that is a fantastic situation on a garbage-can basis.

Mr. Cook. I do not think it is fantastic. It is a piece——

Senator HICKENLOOPER. I know you do not as long as it is Government money that is going in there, but I do not believe that any sound business commercial enterprise would do a thing like that.

Mr. Cook. I treat Government money just as carefully as I treat my own. I am a taxpayer myself, and our sole job down there is to assure economical operation and economical costs, and I do not believe that you can construct the garbage-can enclosures and bases that were constructed down there so that we do not have continuing maintenance costs on them—they were constructed to obviate that. I do not believe you can construct them any place in the country for less than \$34 each.

Senator HICKENLOOPER. Well, then, maybe you cannot the way you constructed them.

The CHAIRMAN. Who built them? Who had the contract?

Mr. Cook. They were built by our operating contractor, Roane-Anderson Co.

Senator HICKENLOOPER. Another little item occurred last year that was quite interesting. It did not go through, fortunately, but I call your attention to it: In the budget of last year there was an item included and represented to the Congress as needed of \$397,000 for, I believe, the tearing down and removal of the thermal diffusion plant.

We sent some inspectors down there, and we found the plant had already been removed, and there was nothing but a cement slab down there. When we finally did call that to the attention of the joint committee, that was hastily withdrawn from the budget, and I merely

mention it as an indication of some of the confusing operations that go on.

Mr. COOK. I do not recall an item of that nature. I recall an item of \$384,000 for a garage. If an item of that nature was in the budget it was there by error.

Senator HICKENLOOPER. Well, I think it was, because it was withdrawn when investigation showed that the facilities for which it was put in there were already removed.

Now, there is an item charged to operating expense, the cost of installation of sidewalks and steps for the houses in Oak Ridge. What would you say is the average lot width there of these houses in Oak Ridge? I do not mean the places where the big frontages are, but the average frontage there in these houses where these people live in Oak Ridge. Would it be 40 feet, 60 feet, 30 feet, 70 feet?

Mr. COOK. I think the average is in excess of 100 feet.

Senator HICKENLOOPER. For each house?

Mr. COOK. Yes. That is by reason of the terrain. It is built on ridges and valleys, and it is impossible to locate the housing in the same manner that you would a flat terrain.

Senator HICKENLOOPER. Yes. Well, the item that I was referring to—my recollection of Oak Ridge was that they were more congested than that—was the cost, the budgetary cost of \$263 per house for the sidewalks and steps that were installed down there. That may or may not be an excessive amount if they are 100 feet on the average.

Mr. COOK. All of the construction for permanent sidewalks and steps for the community was the result of lump-sum competitive bidding, and I thought we received some very good prices on those bids.

Senator HICKENLOOPER. Mr. Chairman, I know, because Mr. Hinshaw wants to take up something else, that I had better hurry along. I would like to read at this time an excerpt from a letter that I just received. This is a copy of a letter that was sent to Representative Thomas. I received it on June 3.

The CHAIRMAN. Which Representative Thomas?

Senator HICKENLOOPER. Albert Thomas, Representative Albert Thomas of Texas.

The CHAIRMAN. Oh, yes; chairman of the Subcommittee on Appropriations.

Senator HICKENLOOPER. And they were forwarded to me.

I would like to read them and ask for your comments on them.

This man is discussing a town operation in some detail. I would like to have the whole letter placed in the record, but I will not take time to read it. The important points that I want to raise at the moment are these—this is paragraph No. 3, and this man says:

All of the residents object strenuously to the rental "license agreement" (lease) which AEC is trying to force down their throats for the purpose of securing to Roane-Anderson Co. still wider latitude in profits from maintenance. It should be noted that prior to June 1, 1949—

that is just a few days ago—

every tenant was expressly forbidden by Roane-Anderson Co. to perform even the most minor or most necessary acts of maintenance on his dwelling unit, under penalty of having Roane-Anderson Co. undo such acts at the expense of the renter and reperform the maintenance also at the expense of the renter. Roane-Anderson Co.'s charges are no picayune matter, either. Roane-Anderson Co. removed from my dwelling a standard fuse box and installed therein (at who

knows what cost) a "fustat" accommodating a special type of fuse, so that when my line carrying 20 amperes blew out the 15-ampere fuse therein, I could not replace it with a standard fuse in 30 seconds. Instead, I had to call Roane-Anderson Co., who after 1 to 4 hours sent out an electrician to replace it in 30 seconds—cost was \$1.73 minimum. I have admitted two electricians to replace such a 15-ampere fuse—cost, \$3.46 minimum—and have had an inspector appear later to verify that the fuse had been replaced, at a cost of a further \$1.73 minimum. These costs were not assessed against me, but against AEC. Any Oak Ridge resident can substantiate many similar stories.

Now, that may be a small item. He is using it as an illustration, and, as I have said before, Mr. Chairman, I have a drawer file full of many pieces of information that have come in; I have a tremendous file of complaints of this kind. I am not going to burden the record at this time with them, but I will submit them to the committee later.

Do you have any knowledge of a situation of that kind?

I am using it as an illustration.

Mr. Cook. When the project first began, there were no facilities available for the people to apply to, as they would in a normal community, for miscellaneous services, and the routine maintenance normally encountered in any house.

Senator HICKENLOOPER. What about this statement, where this fellow says:

It should be noted that prior to June 1, 1949, every tenant was expressly forbidden by Roane-Anderson Co. to perform even the most minor and most necessary acts of maintenance on his dwelling unit, under penalty of having Roane-Anderson Co. undo such acts at the expense of the renter and reperform the maintenance, also at the expense of the renter.

Mr. WILLIAMS. Mr. Chairman, I happened to have lived at Oak Ridge for a couple of years and, I think, one whole year in one of the houses they may be talking about, and Roane-Anderson never interfered with me unplugging my sink or putting in a fuse or doing anything else I wanted to do.

Now, I know I was not given special consideration when I left, due to the fact that a fixture on the porch had rusted, and the light shade dropped, and I had to pay 75 cents, so I know that I was not given any special consideration.

There were certain rules and certain regulations which were necessary in a town of this size, because if you did not have them, the walls would be completely filled with nails, the people would put pennies in the back of fuses, and there would be a lot of things requiring inspection and requiring some order of business to prevent fires.

We had a town there that was so located that if we had any fires they would have been quite bad. We have a very good record on that account. We have not lost much by fires, and we have not lost that because there was special attention given to some of these details.

Now, I do not believe—at least, I never experienced it while I was there—that Roane-Anderson prevented a person from unplugging his sink if he wanted to.

Senator HICKENLOOPER. This man claims that they installed a different type of fuse box which would not accommodate—he says it was a special type of fuse.

Mr. Cook. Those special-type fuse boxes were installed to prevent overloading of circuits. We had quite a bit of difficulty at one time with people using higher amperage fuses than the circuits were designed to withstand, causing fire hazards.

I would like to point out that at the present time we recently inaugurated a new landlord maintenance policy, which is the same type policy used by private real-estate operators in the management of their housing, and things of that nature that you have described there do not and will not occur.

I would also like to point out that I do not know how many of that type of letters you have received, but Roane-Anderson in the last year has averaged almost 4,000 calls a month for service. That is 120,000 calls a year, and we have received very few complaints when you consider the magnitude of the job that they are performing.

Senator HICKENLOOPER. Mr. Chairman, we still have 10 minutes, and I would not like to crowd Mr. Hinshaw on a matter that he wanted to bring up, because we have a vote at 1 o'clock, and we will have to leave.

I would like to submit this letter to Representative Thomas at this time.

(The letter referred to is as follows:)

OAK RIDGE, TENN., May 31, 1949.

Representative ALBERT THOMAS,

*United States Congress, Washington, D. C.*

DEAR CONGRESSMAN: In the name of a large group of Oak Ridge residents for whom I am speaking, I wish to congratulate you on the fine job you have been doing in laying bare to the public the scandalous waste of public funds in Oak Ridge by AEC and Roane-Anderson Co., and other AEC agents. For some time we have been trying to obtain a competent and dispassionate investigation of the situation here, and isolated instances of deliberate mismanagement are being reported to and documented by our town council and our housing committee; typical instances are also being relayed to relatives in the home States, with recommendations that they be publicized among friends and held in abeyance until their Representatives come up for reelection. It is comforting indeed to find that your committee has made such a start on some of the basic issues involved.

The truth of the matter involving the mass rebellion of Oak Ridge residents against the rent increase is this:

(1) In a few instances, such specifically as TDU units, the rent increases of from 90 to 101 percent are extortionate, and the lowly laborers who occupy these units can't afford to pay such rent.

(2) Most of the fuss raised by most of the residents about rent increases was a ready fulcrum to lever the appalling waste rampant in Oak Ridge into public attention. When satisfactory action is taken to remedy these ills, most of the residents will honestly admit that their rent increases are reasonable. They will not, however, supinely see rent increases being diverted into Roane-Anderson Co.'s till along with taxpayers' funds as subsidies, which subsidies amount to more, for every dwelling unit on the area, than the total rent (including increases) collected from each such dwelling unit.

(3) All of the residents object strenuously to the rental "license agreement" (lease) which AEC is trying to force down their throats for the purpose of securing to Roane-Anderson Co. still wider latitude in profits from "maintenance." It should be noted that prior to June 1, 1949, every tenant was expressly forbidden by Roane-Anderson Co. to perform even the most minor and most necessary acts of maintenance on his dwelling unit under penalty of having Roane-Anderson Co. undo such acts at the expense of the renter, and reperform the maintenance also at the expense of the renter. Roane-Anderson Co.'s charges are no picayune matter, either. Roane-Anderson Co. removed from my dwelling a standard fuse box and installed therein (at who knows what cost) a fustat accommodating a special type of fuse, so that when my line carrying 20 amperes blew out the 15-ampere fuse therein, I could not replace it with a standard fuse in 30 seconds. Instead, I had to call Roane-Anderson Co., who, after 1 to 4 hours, sent out an electrician to replace it in 30 seconds—cost was \$1.73 minimum. I have admitted two electricians to replace such a 15-ampere fuse—cost, \$3.46 minimum—and have had an inspector appear later to verify that the fuse had been replaced, at a cost of a further \$1.73 minimum. These costs were not

assessed against me, but against AEC. Any Oak Ridge resident can substantiate many similar stories.

As a result of almost no maintenance performed on dwellings here, they are in sad shape; the residents refuse to do now at their own expense such maintenance as AEC or Roane-Anderson Co. may, on the basis of the new "license agreement," require them to perform to place the dwellings in whatever condition Roane-Anderson Co. may decide upon.

The residents of Oak Ridge wish Congress to have AEC offer them a reasonable and equitable rental agreement instead of the revolting document that AEC now decrees is fair, with the warning, "Sign—or else."

We all hope that you will be able to rid Oak Ridge of the incubus that is Roane-Anderson Co. With efficient management, the town of Oak Ridge could be and should be self-supporting, and possibly able to pay part of the cost of the research and production operations that are now also being too heavily subsidized.

Our town council and our housing committee are not professional politicians or experienced organizers, and have their hands full attempting to cope with this intolerable situation. They have asked for and are getting the support and help they need to bring these matters to the attention of the proper authorities and of the interested public outside of Oak Ridge.

Yours very truly,

W. J. O'LEARY.

(Copy to Senator Bourke B. Hickenlooper.)

Mr. HINSHAW. Mr. Chairman, I shall not request the Commission to answer this memorandum today, but I would like to present it as notice that an answer is requested.

Since the discussion of the pipe line question—I believe it was last week or the week before—and about that time, I believe, a decision was handed down by the Supreme Court in what is known as the Pan-handle case. This matter of gas pipe line has also been before my committee in the House, and there has been considerable discussion, not in respect to this particular case, but in respect to gas pipe lines in general, and in listening to the testimony of the Commission, particularly Mr. Pike on this subject, I was concerned as to the firmness of the source of supply of gas for Oak Ridge; and, with the chairman's permission, I would like to read this, and then request an answer to be made later:

Contract No. AT-40-1 GEN-244, which is a contract between the Atomic Energy Commission and the East Tennessee Natural Gas Co., has as its purpose the supply of natural gas to the Oak Ridge area.

There is a statement in the preamble to the contract which states:

Witnesseth, that—

and so forth. [Reading:]

Whereas the gas company will obtain its requirements of natural gas from the Tennessee Gas Transmission Co.—

and so forth.

Now, article I, entitled "Scope" reads in part as follows:

1. The gas company shall apply for promptly and use due diligence \* \* \* for the purchase of a supply of natural gas necessary to enable it to deliver to the Government at the points of delivery, defined herein, the volume of natural gas contemplated by this agreement,

and so forth.

Article III—Character of Service reads in part as follows:

\* \* \* This agreement shall obligate the gas company to sell and be ready at all times, commencing with the day of initial delivery, to deliver to the Government the contracted demand and the Government shall have the right to purchase and receive from the gas company up to the contracted demand.

Now, there is nothing that I can find in the above sections of this contract which requires the Commission or the gas company to show a contractual relationship between them and the Tennessee Gas Transmission Co.

It would seem that before the AEC obligates itself to purchase gas from a distributor, it should have a guaranty in the form of a contract that such gas as is needed is and will be available according to the terms of the above-mentioned contract.

Actually, the gas company is a third handler of this fuel. The first party is the seller to the carrier. The second party is the carrier. The third party is the Tennessee Natural Gas Co. with which the AEC has contracted.

Now, there is no guaranty on its face that the gas company can cause either parties 1 and 2, that is, the original supplier and the original carrier, to supply its needs for the Oak Ridge area to the exclusion of others who may be customers of those companies.

There are the usual penalty clauses providing for rights and duties should either party to this contract fail to abide by its terms. There is nothing unusual about that. There are also provisions for relief from liability by force majeure, such as acts of God, strikes, and so forth.

There is nothing, however, which will guarantee to the Government that the gas company will have to prove its ability to perform the contract.

There is a sentence in article I which reads:

When requested by the Commission, and to the extent that the Commission may require, the gas company shall submit to the Commission adequate information concerning the status of its undertakings under this paragraph.

The undertakings referred to are that it will apply for promptly and use due diligence for the purchase of the gas the Commission requires under this contract. There is no absolute requirement that a contract between the gas company and its suppliers must be shown.

In the hearings on the subject of the pipe line, Commissioner Pike said, and I quote from the record:

We were assured by the gas-transmission people that the gas we will require will come out of additional gas, which will soon be coming through the Tennessee Gas Transmission line.

Now, that is contained on page 8 of the transcript.

Then again on the same page, Mr. Pike says:

The Tennessee Gas Transmission is expanding its pipe-line capacity, and this would be part of the additional supply which they expect to have coming along in the next 2 or 3 years.

These statements do not imply that if the transmission company fails in its effort to supply the gas company for the ultimate use of the Commission, the Commission will have anything other than a cause of action against the gas company. If the gas company fails in living up to its contract, it may not then be financially responsible enough to save the Government from loss.

There are no terms in this contract governing the supply of gas to the Commission beyond the obligations of the gas company, the Tennessee Gas Transmission Co. There are no provisions whereby the gas company must show its ability to deliver according to the contract.

There is nothing in the recent decision of the United States Supreme

Court in the case of *Federal Power Commission v. Panhandle Eastern Pipe Line Company, et al.*, 558, decided June 20, 1949, which seems to apply in this matter.

If there is a contractual or fiduciary relationship between the East Tennessee Natural Gas Co. and the Tennessee Gas Transmission Co., this is not shown in the contract under discussion.

There is no showing that performance and payment bonds as required by the AEC General Manager's Bulletin GM-108 have been waived in the interest of the United States. Such bonds are required under GM-108 where the amount of the contract is in excess of \$2,000, and this contract is very much in excess.

It is interesting to note that the Supreme Court of the United States has decided—and this, Mr. Chairman, is an exceedingly important thing—that the Texas Railway Commission has regulatory powers over the output of natural-gas wells as well as oil wells.

If the Texas Commission, the Texas Railway Commission, decides for reasons best known to itself, that it desires to constrict the output and delivery from Texas of natural gas, that they have a right to do so, and there is no assurance that I can find anywhere that the K-25 plant, the electric plants, and the AEC, of course, have the absolute assurance that they can obtain these gas supplies under any such contract that they may have, either with No. 2, which is the Tennessee Gas Transmission Co., or with its basic suppliers and gatherers in the Texas fields, and I just wondered if the Commission can answer that in due course for the benefit of the committee.

(The data referred to above are marked "Exhibit 24" and will be found in the appendix.)

The CHAIRMAN. All right.

I would like to ask one question before we adjourn.

Has any thought been given—is any thought being given or has any thought been given to giving this Roane-Anderson subsidiary of Turner Construction Co. any competition in the way of bidding?

Mr. COOK. It is the type of an operation where it is impossible to prepare plans and specifications by reason of the many different types of work they do, and the varying work load that they have.

The CHAIRMAN. I still think we can get a better deal than that.

We will meet tomorrow morning at 10:30.

(Whereupon, at 1 p. m., the joint committee adjourned, to reconvene at 10:30 a. m., Wednesday, June 29, 1949.)

# INVESTIGATION INTO THE UNITED STATES ATOMIC ENERGY PROJECT

---

WEDNESDAY, JUNE 29, 1949

CONGRESS OF THE UNITED STATES,  
JOINT COMMITTEE ON ATOMIC ENERGY,  
*Washington, D. C.*

The joint committee met, pursuant to adjournment, at 10:35 a. m., in the Caucus Room, Senate Office Building, Washington, D. C., Senator Brien McMahon (chairman) presiding.

Present: Senator McMahon (chairman); Representative Durham (vice chairman); Senators Vandenberg, Millikin, Knowland, and Hickenlooper; Representative Holifield.

Also present: David E. Lilienthal, Chairman; Sumner T. Pike, Commissioner; Lewis L. Strauss, Commissioner; Gordon E. Dean, Commissioner; Henry D. Smyth, Commissioner; Carroll L. Wilson, General Manager; Carleton Shugg, Deputy General Manager; Frances Henderson, Assistant to the Chairman; Walter J. Williams, Director, and Carroll Towne, Division of Production; Joseph Volpe, Jr., General Counsel; Bennett Boskey and Everett L. Hollis, Office of General Counsel; Morse Salisbury, Director, and Rodney L. Southwick, Division of Public and Technical Information Service; Fletcher Waller, Director, Division of Organization and Personnel; Richard W. Cook, Acting Manager, S. H. Sapiirie, Chief of Engineering and Production, and Fred W. Ford, Director of Community Affairs, Oak Ridge Operations Office; all of the United States Atomic Energy Commission.

Clinton Hernandez, Vice President, Lyle D. Worrell, Assistant Project Manager, L. C. Macneal, Project Manager, and St. John W. Davis, Audit and Budget Division Manager, of the Roane-Anderson Co. (Oak Ridge).

Clark Center, General Superintendent; William B. Humes, Superintendent, K-25; Clarence E. Larson, Superintendent, Y-12; Oral Rinehart, Controller; and Logan Emlett, Superintendent, Operations Division, Oak Ridge National Laboratory, of the Carbide & Carbon Chemicals Corp. (Oak Ridge).

The CHAIRMAN. The meeting will come to order.

## STATEMENT OF CARLETON SHUGG, DEPUTY GENERAL MANAGER, ACCOMPANIED BY JOSEPH VOLPE, JR., GENERAL COUNSEL, BOTH OF THE UNITED STATES ATOMIC ENERGY COMMISSION

Mr. SHUGG. Mr. Chairman, may I make a brief statement responsive to the figures requested yesterday in regard to veterans?

The CHAIRMAN. Yes. It will not take you very long, will it, Mr. Shugg?

Mr. SHUGG. It is two and a half pages, double spaced, sir.

In employment and lay-off of personnel, the AEC has complied fully with the requirements of the Veterans Preference Act of 1944. The AEC policy is clearly stated in its record of performance, and is as follows:

Percentage employment of veterans in the AEC exceeds that in the Federal service as a whole.

For example, on the last date for which comparable figures are available, March 31, 1949, veterans represented 49.2 percent of all AEC employees, while a corresponding figure for the entire Federal Government was 46 percent. Seventy-two and two-tenths percent of all AEC male employees were veterans, compared with 57 percent for the Federal service as a whole.

The ratio of the veteran force in AEC has increased from 42.7 percent in March of 1947 to 46.6 percent in June 1949.

I should like to submit a table for the record which compares AEC and the Federal Government as a whole with respect to the employment of veterans.

Yesterday attention was called to our lay-off policy at Oak Ridge. Consideration of the questions raised yesterday requires a review of the relationship of AEC's policy to the Veterans' Preference Act of 1944, and to the Civil Service Commission's regulations.

AEC's lay-off policy states that:

When it is necessary to reduce employment the selection of employees for retention within an appropriate geographical area will be on the basis of relative qualifications for the work remaining to be done, and in accordance with requirements of the Veterans' Preference Act of 1944, including veteran status, demonstrated performance, and length of Federal service.

The Civil Service Commission is charged with responsibility for issuing regulations to carry out the Veterans' Preference Act with respect to lay-offs, both from positions in the classified civil service, and positions outside the classified service.

Prior to January 9, the effective date of the AEC decision to exempt its positions from the classified civil service, lay-offs in the AEC were made in accordance with civil-service regulations applicable to positions within the classified service.

After January 9, lay-offs were made in accordance with civil-service regulations applicable to positions outside the classified service. This change affected veterans in two ways: First, veterans without civil-service status improved their competitive position with respect to all nonveteran employees with civil-service status.

This is due to the fact that after January 9, 1949, the AEC no longer distinguished between employees with and those without civil-service status.

As a result, veterans without status, who previously were subject to lay-off ahead of nonveterans with status, acquired a preference over all nonveterans in the same competitive level, that is, positions of the same grade and type of work which were considered to be interchangeable.

Second, veterans could no longer bump nonveteran employees in other competitive levels. The process of bumping across competitive levels is established by the civil-service regulations in the case of posi-

tions in the classified service, and is not established in the case of positions outside the classified service.

In short, the AEC, conforming to the appropriate civil-service regulations, has given all veterans absolute preference for reduction-in-force purposes in jobs that are interchangeable.

Referring directly to the Oak Ridge situation, the guard force, consisting of 385 veterans and 7 nonveterans, that is a total of 392, was reduced to 229, all of whom are veterans.

This lay-off of 163 guards necessitated laying off 156 veterans, because there were only 7 nonveterans and those were laid off.

In addition, 131 employees in other occupations were laid off at Oak Ridge during this period, which is from January to June 1949. Twenty-seven of those were veterans.

Each employee laid off receives a notice which includes advice as to his right to appeal to the Civil Service Commission, and I have copies of those, which I would like to insert into the record.

Of the total of 294 employees laid off since January 9, 1949, only 1 has filed an appeal with the Civil Service Commission. This appeal is pending.

The record of employment at Oak Ridge shows that as of June 27, 1949, 51.3 percent of the total employees were veterans. Of the male employees as of that date, 74.3 percent were veterans.

We believe these figures are evidence of good faith in the administration of veterans' preference in Oak Ridge operations.

Senator HICKENLOOPER. You take the position then, Mr. Shugg, that the Veterans of Foreign Wars, and the AMVETS, and the Legion Post down around Oak Ridge are mistaken in their attitude in this matter? I may say that I did not primarily raise this issue originally. I merely read into the record the resolutions of these posts down there.

Mr. SHUGG. I think, Senator, that if they believe that our policy reacts against the veterans, and in any way weakens the Veterans' Preference Act of 1944, then I think they are mistaken in that, sir. There may be individual cases subject to appeal, which we are not yet aware of.

Senator HICKENLOOPER. These resolutions were pretty broad.

Mr. SHUGG. Yes, sir.

Senator HICKENLOOPER. According to the telegrams I had put into the record. That particular phase of the matter, I have not gone into independently of these reports, but having received telegrams, and the notice of resolution, I put them into the record yesterday.

It may be a matter that we will want to go into a little further at a later date. I think it is a very important matter, because there have been many individual complaints coming in throughout the AEC operations, which I have not put in as individual complaints; but many of them have come in complaining about treatment of veterans in the AEC program, and I think it is a very vital and very important thing, and I think it should be carefully looked into.

Mr. SHUGG. If I may, Senator, I would like to introduce these into the record. The statements to the individual employees are intended to be fully informative, but like a lot of such statements, they also require personal explanation.

Senator HICKENLOOPER. All right, put the tables into the record if you have them there, whatever the facts are.

(The information referred to is as follows:)

(Reduction-in-force notice to employees without civil-service status)

## UNITED STATES ATOMIC ENERGY COMMISSION

OAK RIDGE, TENN.

Subject: Reduction in force.

The curtailment of work activities has rendered personnel in certain categories surplus to the future requirements of this office. Therefore the Atomic Energy Commission is forced to reduce personnel at Oak Ridge, Tenn.

After careful review of personnel requirements it has been determined that it will be necessary to eliminate positions in your competitive level. In view of your having been reached on the retention register and as there is no appropriate position to which you may be reassigned, it is necessary to terminate your services because of reduction in force. Your active-duty status will cease as of the close of business on ----- Thereafter you will be carried on the rolls of this office in a nonduty status with pay (on a pay-period basis) for the duration of your annual leave, if any; and until the close of business ----- in a furlough status. Being placed in a furlough status means that during the period you are on furlough you may be returned to duty, should an appropriate vacancy occur, without formal appointment procedure. If you desire to be separated from the service in lieu of being placed in a furlough status you may resign at any time after receipt of this notice and such resignation will be considered as an involuntary separation.

The Placement Section, Government Personnel Branch, wing 5, north, first floor Main Administration Building, will make the civil-service regulations relating to reduction in force available to you and give you an opportunity to examine the retention preference register on which your name appears. If after inspecting the retention register and discussing your separation you feel that there has been a violation of your rights under the retention preference regulations, you have the right to appeal in writing to the Fifth United States Civil Service Region, New Post Office Building, Atlanta 3, Ga. This appeal must be made within 10 days after receipt of this letter and should include your specific reasons for appealing. Forwarding such an appeal through this office will expedite action on the case as data required by the Civil Service Commission in order to reach a decision as to whether or not there has been a violation will be forwarded with the appeal.

You can determine the amount of accrued leave to your credit by contacting Mr. Ralph L. Story, Main Administration Building, telephone extension 4681.

No lump-sum payment for annual leave to your credit can be made unless you resign as it is mandatory that all persons placed in a furlough status be carried on the rolls with pay for the duration of their annual leave.

You are at liberty to file applications for employment with other Government agencies or with other Atomic Energy Commission installations. You may forward Standard Form 57 directly to the agency with which you desire employment or if you wish they will be forwarded by this office if you will furnish copies of Form 57 for each location at which you desire consideration.

It should be borne in mind that consideration of your application by agencies other than the Atomic Energy Commission will be precluded in most instances because you do not have competitive civil service status. Therefore, if you are interested in further Government employment with other agencies it is suggested that you file for civil service examinations in your line of work which are announced from time to time by the Civil Service Commission. Announcements of civil service examinations are posted on first- and second-class post office bulletin boards.

Your contribution to the Federal service is appreciated and the necessity for this action is sincerely regretted.

Very truly yours,

J. G. LeSIEUR, Jr.,  
Chief, Government Personnel Branch.

---

(Reduction-in-force notice to employees with civil-service status)

UNITED STATES ATOMIC ENERGY COMMISSION

OAK RIDGE, TENN.

Subject: Reduction in force.

The curtailment of work activities has rendered personnel in certain categories surplus to the future requirements of this office. Therefore, the Atomic Energy Commission is forced to reduce personnel at Oak Ridge, Tenn.

After careful review of personnel requirements it has been determined that it will be necessary to eliminate positions in your competitive level. In view of your having been reached on the retention register and as there is no appropriate position to which you may be reassigned, it is necessary to terminate your services because of reduction in force. Your active-duty status will cease as of the close of business on \_\_\_\_\_. Thereafter you will be carried on the rolls of this office in a nonduty status with pay (on a pay-period basis) for the duration of your annual leave, if any; and until the close of business \_\_\_\_\_ in a furlough status. Being placed in a furlough status means that during the period you are on furlough you will be given an opportunity to return to duty to fill vacancies in the competitive level from which you were furloughed before any original appointments are made to such positions. Offers of recall to duty will be made in the order of retention preference of furloughed employees. In addition, your recall to duty to fill positions in other competitive levels also will be considered. If you desire to be separated from the service in lieu of being placed in a furlough status you may resign at any time after receipt of this notice and such resignation will be considered as an involuntary separation.

The Placement Section, Government Personnel Branch, wing 5, north, first floor, Main Administration Building, will make the civil-service regulations relating to reduction in force available to you and give you an opportunity to examine the retention preference register on which your name appears. If, after inspecting the retention register and discussing your separation, you feel that there has been a violation of your rights under the retention preference regulations, you have the right to appeal in writing to the Fifth United States Civil Service Region, New Post Office Building, Atlanta 3, Ga. This appeal must be made within 10 days after receipt of this letter and should include your specific reasons for appealing. Forwarding such an appeal through this office will expedite action on the case as data required by the Civil Service Commission in order to reach a decision as to whether or not there has been a violation will be forwarded with the appeal.

You can determine the amount of accrued leave to your credit by contacting Mr. Ralph L. Story, Main Administration Building, telephone extension 4681. No lump-sum payment for annual leave to your credit can be made unless you

resign as it is mandatory that all persons placed in a furlough status be carried on the rolls with pay for the duration of their annual leave.

You are in retention subgroup ----- and have competitive status acquired by ----- effective ----- Inasmuch as you are presently serving under a permanent excepted appointment which followed without break in service a probational or permanent civil service appointment, you may, if you desire, file applications with the United States Civil Service Commission for employment in another Government agency. Such applications may be filed at any time between the date this notice is received and 90 days following your last day of active duty. Applications may be filed for two positions with one Civil Service regional office, or with any boards of United States Civil Service examiners in one region, and with the United States Civil Service Commission, Washington, D. C. Applications should be made on Standard Form 57 indicating clearly the positions for which application is being made. Each form filed must be accompanied by a copy of this notice of termination. If you apply to the Civil Service Commission under the provisions of this paragraph, you should complete an additional form 57 and carry it with you whenever you report for interview for further Federal employment, releasing it only upon appointment.

You are also at liberty to file applications for employment with other Government agencies or with other Atomic Energy Commission installations. You may forward Standard Form 57 directly to the agency with which you desire employment or if you wish they will be forwarded by this office if you will furnish copies of Form 57 for each location at which you desire consideration.

Your contribution to the Federal service is appreciated and the necessity for this action is sincerely regretted.

Very truly yours,

J. G. LESIEUR, Jr.,  
Chief, Government Personnel Branch.

Mr. VOLPE. I think, Senator Hickenlooper, that some of our difficulties with respect to veterans' preference arises not out of employment with the Government, but rather out of employment with contractors; that is, veterans employed—employees of the contractors engaged in the atomic energy program, and I would in that connection—

Senator HICKENLOOPER. Well, we cannot—so far as the contractor situation is concerned, I do not intend to go into that philosophy in this investigation, but I call your attention to the fact that that contractor's employees cannot be employed without the permission of the Commission; that they do the work as directed generally under the policies set up by the Commission.

Take the money to pay the employees, that comes from the Government, it is public funds, and I think there is a great deal to be said about the theory that the employees are to all intents and purposes Government employees except for the fiction that the contractor merely acts as the transfer agent in passing the check to the employee; and I had not intended to get into that philosophy of Government employee employment as against the contractor employment, but I think there is much to be said on the side of the argument that these people are—that is, that the contractor employees are in fact, to all practical intents and purposes, except for the convenience of handling the checks and dealing with labor relations, perhaps, that they are for all intents and purposes actually Government employees. That can be saved for another line of argument on the philosophy of that type of employment.

Mr. VOLPE. Well, Senator, I was merely offering that as an explanation for some of these telegrams.

Senator HICKENLOOPER. Yes.

Mr. VOLPE. Why some of these telegrams—I think we will probably find that they are contractor employees.

I would just like to make this one additional comment. On August 8, 1946, the Attorney General, in response to a request by the Secretary of War, for an opinion as to whether the Veterans' Preference Act applied to employees of contractors in the atomic energy program, particularly at Oak Ridge, ruled that the Veterans' Preference Act did not apply.

Senator HICKENLOOPER. I realize that there is a legal technicality involved there, and, as I say, I do not care to get into a dispute or an argument on that particular philosophy at the moment. There may be a better time and a more appropriate time, but there is some powerful argument on that side of the situation, and there is also the legal argument on the other side as to the exact legal status and the moral or actual status of these employees; but I do not think that we ought to take time in this hearing to fight that matter out.

Now, if I may, I would like to ask Mr. Cook, if he is here, some questions.

**STATEMENT OF RICHARD W. COOK, ACTING MANAGER, OAK RIDGE OPERATIONS OFFICE, ACCOMPANIED BY WALTER J. WILLIAMS, DIRECTOR, DIVISION OF PRODUCTION, BOTH OF THE UNITED STATES ATOMIC ENERGY COMMISSION**

Senator HICKENLOOPER. Mr. Cook, on the employment of the employees of Roane-Anderson Co., it was testified on February 16, 1949, that Roane-Anderson Co.—this is in the hearings before the subcommittee on the independent offices appropriation bill of 1950—it was testified that Roane-Anderson had 2,501 employees. Then, yesterday, I believe you said that as of May, sometime in May they had nine hundred-odd employees, and then as of the 13th of June they had 1,881 I believe you stated.

Now, is that statement correct? Did they have 2,501 employees as of that date, on February 16; do you recall?

Mr. Cook. That was the number of employees they had at the time the budget data justification was prepared.

Senator HICKENLOOPER. This testimony was given on February 16, 1949.

Now, what figures do you have for the reduction in force after February 16, 1949, up to May? When were those reductions put into effect?

Mr. Cook. The reductions over the last several years have been—

Senator HICKENLOOPER. I am not talking about several years.

Mr. Cook. Continuous. I do not have the exact reductions with me.

Senator HICKENLOOPER. Do you have the number they had on March 1, 1949, March 15, or April 1, or April 15, or any other date?

Mr. Cook. Just a minute. On February 14, 1949, there were 1,780 people on Roane-Anderson pay roll and 637 people on the municipal pay roll.

Senator HICKENLOOPER. What are those figures again?

Mr. Cook. 1,780 and 637.

Senator HICKENLOOPER. That would make 2,417, as I get it.

Mr. Cook. That is right.

Senator HICKENLOOPER. On February 14, 1949?

Mr. Cook. Yes, sir.

Senator HICKENLOOPER. On February 16, 1949, Mr. Ford made the statement that there were 2,501 employees. What is the discrepancy there?

Mr. COOK. On January 3, there were 1,983 on the Roane-Anderson pay roll, and 660 on the municipal pay roll.

Senator HICKENLOOPER. Now, Mr. Ford was manager for Roane-Anderson at Oak Ridge?

Mr. COOK. He is not manager for Roane-Anderson. He is a Commission representative, Director of the Office of Community Affairs, who is responsible for the administration of the Roane-Anderson contract.

The CHAIRMAN. Is he here?

Mr. COOK. Yes, sir; he is here.

Senator HICKENLOOPER. Mr. Franklin says, "I am the manager of Oak Ridge, and we have the manager of the city here, Mr. Ford."

Mr. Ford is a Commission employee, is that it?

Mr. COOK. Mr. Ford is a Commission employee.

Senator HICKENLOOPER. And he is the manager of the city for the Commission?

Mr. COOK. In addition to his other duties, yes.

Senator HICKENLOOPER. But among them is that he manages or that he is the Commission representative for the city, the management of the city?

Mr. COOK. That is right, sir.

Senator HICKENLOOPER. In addition to his other duties. What are his other duties?

Mr. COOK. As director of the Office of Community Affairs, he is responsible for all the real-estate operations of the Commission in the community.

Senator HICKENLOOPER. Yes.

Mr. COOK. And the community construction.

Senator HICKENLOOPER. What is Mr. Ford's salary?

Mr. COOK. \$10,330 per year.

Senator HICKENLOOPER. So, in behalf of the Commission he is sort of a city manager at \$10,330, representing the Commission, and Roane-Anderson which manages the city in other operations has an executive officer at \$12,000—some a year looking after these directions, and there are three other people in Roane-Anderson in this operation who get between—or in excess of \$8,400 a year; is that correct?

Mr. COOK. Yes, but the municipal activities or the city management activities to which you refer are approximately 20 percent of the total work load costwise of the work done by the Office of Community Affairs and the Roane-Anderson Co.

Senator HICKENLOOPER. Yes.

Now, I would like to go through a list of the contracts by Roane-Anderson at Oak Ridge, which I am reading from the Commission report. This is a report developed called the Construction Program Data, and it is a report requested at the Appropriations Committee hearings by the House and is supposed to be inserted in the public record in the appropriate place there. I do not have a page number on this report, but they are photostatic copies of the report.

I notice that one of the contracts in which Roane-Anderson is a prime contractor at Oak Ridge is item No. 10, Budgetary Program No. 730 at Oak Ridge, and it is for a sprinkler system in 22 buildings.

Roane-Anderson is the prime contractor, and the Grinnell Co. is the subcontractor. Is that a contract upon which an additional fee is paid Roane-Anderson under modification 20 of their contract?

Mr. Cook. That contract was entered into prior to article XI in their contract that I read to you yesterday. I can answer the questions that you raised yesterday on that, if you desire at this time.

Senator HICKENLOOPER. You read the article into the record, the article of the contract. Is that what we referred to as the modification 20, article XI, that you read in there?

Mr. Cook. Article XI is a part of modification 20.

Senator HICKENLOOPER. Yesterday, a schedule of the fees to be paid Roane-Anderson was not specifically put into the record under either article XI or modification 20. Do you have a schedule of those fees, I mean, an exact schedule of what they should get?

Mr. Cook. Yes, we do have. They are a part of article XI in the contract.

Senator HICKENLOOPER. Well, I read article XI again as it was read in, and I could not find out any formula or yardstick to figure the fee on any contract with Roane-Anderson. I cannot say it was not in there, but it was not put into the record.

Mr. Cook. It was not put into the record. I gave the range.

Senator HICKENLOOPER. Will you put in the specific provisions, a specific copy of the contract, containing the provisions for the payment of Roane-Anderson's fees on any of these contracts?

Mr. Cook. We will be very glad to.

Senator HICKENLOOPER. If that can be put in so that it can get into today's record, if it can be put in this afternoon.

Mr. Cook. I can read it right here if you wish, sir.

Senator HICKENLOOPER. All right, if you have it.

Mr. Cook. For a job of \$100,000. The way this article is written it would have to be a job equaling \$125,000 before we compute a fee on \$100,000, so for each total I give you here the first \$25,000 are not subject to the fee.

Senator HICKENLOOPER. Suppose it is a job of \$50,000?

Mr. Cook. We would pay a fee on \$25,000.

Senator HICKENLOOPER. I see. All right.

Mr. Cook. On a total estimated cost of \$100,000, a fee of \$1,200; \$200,000, a fee of \$2,340; \$300,000, fee \$3,430; \$400,000, fee \$4,500; \$500,000, fee \$5,550; \$1,000,000, fee \$9,700; \$1,500,000, fee \$13,200; \$2,000,000, fee \$16,400; \$3,000,000, fee \$22,200; \$4,000,000, fee \$27,900; \$5,000,000, fee \$33,500.

So that the fee varies for work in the amount of \$100,000 from 1.2 percent to \$5,000,000 up of five-tenths of 1 percent of the total estimated costs.

Senator HICKENLOOPER. All right.

Now, on this item, this item that I referred to awhile ago, the sprinkling system for 22 buildings where Roane-Anderson is the prime contractor and Grinnell Co. are the construction contractors and subcontractors, is that included in this extra fee scale?

Mr. Cook. No, sir.

Senator HICKENLOOPER. Roane-Anderson gets no fee whatsoever out of that?

Mr. Cook. That is right. That was prior to the agreement.

Under the original contract it was worded that Roane-Anderson Co. would only be expected to do minor maintenance or alteration work to the existing utilities and facilities.

Article XI was written to clarify what are minor alterations or revisions.

A figure of \$25,000 was agreed to, and subsequent to the date of this supplement, all new construction work in excess of \$25,000 that is not a part of their operating contract, the fee for that work is arrived at in accordance with the schedule I just read.

Senator HICKENLOOPER. Yes.

Now, item No. 12, No. 730, Oak Ridge, is a heavy equipment garage. Roane-Anderson Co. is the prime operating contractor, and John A. Johnson & Sons, Inc., is the construction contractor and subcontractor. Does Roane-Anderson get a fee from that job, or will they?

Mr. Cook. According to my records that work was started prior to the entering into of this supplement, and they will not receive a fee.

Senator HICKENLOOPER. So, you say they will not receive a fee on that job?

Mr. Cook. That is right, sir.

Senator HICKENLOOPER. All right, proceeding, item No. 13, which is a stainless steel sink item—stainless steel sinks in Cemento houses, Roane-Anderson Co. is the prime contractor; Hicks & Ingle are the subcontractors.

Mr. Cook. They will not receive a fee for that work, sir.

Senator HICKENLOOPER. All right.

Mr. Cook. Yes, sir.

Senator HICKENLOOPER. Item No. 14, painting exterior and interior of 1,000 houses, Roane-Anderson Co. is the prime operating contractor, and Anderson—

The CHAIRMAN. How could anybody else get in there? They are the insiders.

Senator HICKENLOOPER. Anderson Bros. Painting & Decorating Co. is the subcontractor. Did they get a fee on that?

Mr. Cook. No, sir, that is considered a part of the normal operating responsibility in the operation and maintenance of the housing, and they will not receive an additional fee.

Senator HICKENLOOPER. All right. Item No. 20, ventilation and installation—commercial buildings; Roane-Anderson Co. is the prime operating contractor, and Rentenbach is the engineering company. Does Roane-Anderson get a fee on that at all, or will they?

Mr. Cook. They will not.

Senator HICKENLOOPER. Item No. 21, install fire alarm system; Roane-Anderson Co. is the prime operating contractor; Tennessee Armature & Electric Co. is the construction contractor and subcontractor. Will Roane-Anderson Co. get a fee on that contract, or have they?

Mr. Cook. To the best of my knowledge they will not. I do not have that listed.

The CHAIRMAN. Does anybody have a contract at Oak Ridge except Roane-Anderson?

Mr. Cook. Yes, they do, sir. Roane-Anderson is the prime contractor for the operation of the town. It is more economical.

The CHAIRMAN. I know you inherited Roane-Anderson, and they inherited Zia out at Los Alamos, but it seems to me that when these contracts come up, we have a construction company organizing a subsidiary management company, and it seems they, after that, obtain contracts for the construction company through their management company subsidiary.

Mr. COOK. Sir, the Roane-Anderson Co. does not actually do the work. They operate as agents of the Commission in the preparation of plans and specifications, invitations to bid, receiving bids, and making awards.

The CHAIRMAN. Do you not think it would be better if the construction company had no management company affiliations?

Mr. COOK. The type of work that is to be done by the management company is generally miscellaneous, minor work.

The CHAIRMAN. Now, Turner Construction Co. is a parent corporation of the Roane-Anderson Co. That is right, is it not?

Mr. COOK. That is right.

The CHAIRMAN. And Roane-Anderson manages the town for which they get \$192,000 a year?

Mr. COOK. That is right.

The CHAIRMAN. Now, the Senator reads a list of contracts here for work, and Roane-Anderson does that work, too?

Mr. COOK. Roane-Anderson contracts the work out, sir. They do not actually do the work themselves; that is how we bring competition, and bring in small contractors on these small jobs. They act as an agent for the Commission.

The CHAIRMAN. Will they do any construction work themselves?

Mr. COOK. They do a certain amount of miscellaneous minor alterations themselves, but our whole policy has been to contract out as much as we can, because we find that is the most economical way to operate.

Now, all of the major construction contracts are direct contracts with the Commission.

The CHAIRMAN. Well, I have misunderstood. When he said Roane-Anderson was an operating contractor, that means they have a contract for the painting of 1,000 homes.

Mr. COOK. Oh, no, sir. They subcontract that work out, just as if it were subcontracted out on another job by the Government. They act as an agent for the Government, so all of these things—

The CHAIRMAN. But they do not paint the houses themselves?

Mr. COOK. Oh, no, sir. On occasion, on the change of quarters or something of that kind—

The CHAIRMAN. That is minor in connection with the management contract.

Mr. COOK. That is right, and then we try to contract out all of our interior painting.

The CHAIRMAN. Have they got any major contract of any kind there, other than their management contract?

Mr. COOK. No, sir; they do not, and we insist that they do not have.

The CHAIRMAN. That clarifies it.

Mr. WILLIAMS. Mr. Chairman, I would like, if I may, to just add a word here. When we took over the operation, that is, when the Commission took it over, the Corps of Engineers had set up something similar to—I mean, quite similar to—a district engineer office, and

there were quite a number—I think it amounted to 300 engineers and draftsmen and people writing specifications and so on.

Now, when we examined the whole picture, we found that there were some duplications of effort, considerable duplication of effort. So, in order to make these reductions which we have been presenting to the committee, it was necessary to rearrange our business, and we rearranged our business by giving to Roane-Anderson the requirement for making certain specifications, drawings, supervising the contracts for certain minor construction, and we kept only the major construction contracts where we could hire an architect-engineer to make the plans, and in that manner we have cut down our forces, as shown by the records considerably, that is the way we did it.

We did not do that just after you started this investigation; we have been working on this for a long time.

The CHAIRMAN. That is all right. I want to withdraw my formal remark about "How could anybody else get in if they were the insiders," because I understood from the testimony—maybe it was my fault—that Roane-Anderson was the only concern that seemed to be doing any contracting down there.

Now, as I understand it, they do no contracting at all and do no work except minor repair work in connection with their management contract, is that right?

Mr. WILLIAMS. Yes, sir.

The CHAIRMAN. And anything such as painting 1,000 houses, they simply act as your agents to let bids.

Mr. WILLIAMS. To let bids.

The CHAIRMAN. And they do not bid themselves at all?

Mr. WILLIAMS. No, sir. We do not permit them to. That would be the worst thing; we just could not live with it.

The CHAIRMAN. That is what I thought when I heard it. I am glad it is not true.

Mr. WILLIAMS. No, sir. Turner Construction Co., to my knowledge, have never had any job at Oak Ridge.

Senator HICKENLOOPER. Well, they get \$192,000 a year.

Mr. WILLIAMS. They get \$192,000 a year because they have taken 21 people from their parent organization, 17 of them took over when they were in business for the Turner Construction Co., and spend possibly considerable money and time in training, and we are paying for that knowledge and know how.

Senator HICKENLOOPER. I agree that you are paying for it.

Mr. WILLIAMS. Yes, sir.

Senator HICKENLOOPER. I agree that you are paying for it, and paying plenty.

Now, I would like to go on with Mr. Cook. We just covered item 13, I believe, with Roane-Anderson Co.—item 14—or had we covered that—painting interior and exterior of 1,000 houses; Roane-Anderson Co., is given as a prime operating contractor in this list. This is the Commission records, and I am reading what they say about it. Anderson Bros. Painting & Decorating Co. is the construction contractor and subcontractor.

Now, does Roane-Anderson Co. get any fee out of that?

Mr. Cook. They do not get any fee out of that work. That is just considered a normal operating and maintenance contract.

Senator HICKENLOOPER. They do not get a fee out of that, so that we can get along here.

Item No. 20, No. 730, ventilation and installation, commercial buildings; the prime contractor is Roane-Anderson Co., and the construction contractor and subcontractor is Rentenbach. Does Roane-Anderson get or will they get any fee out of that contract?

Mr. COOK. The answer to that is "No."

Senator HICKENLOOPER. Item 21, install fire-alarm system; Roane-Anderson Co. is listed as the prime operating contractor; the Tennessee Armature & Electric Co. is listed as the subcontractor, the construction contractor. Does Roane-Anderson get any fee out of that?

Mr. COOK. They will receive no fee out of title 11 for their work.

Senator HICKENLOOPER. Will they receive any extra fee of any kind?

Mr. COOK. They will receive no extra fee for that work.

Senator HICKENLOOPER. Item No. 24, alteration and additions to main pump house; Roane-Anderson Co. is listed as the prime operating contractor; Lonas Electric Co. is the construction contractor and subcontractor; will Roane-Anderson Co. get any fee out of that contract whatsoever or have they?

Mr. COOK. They will not nor have they.

Senator HICKENLOOPER. Item No. 45, installation of electric meters in 5,797 houses; Roane-Anderson Co. is the prime contractor; the Cherokee Electric Co. is the construction contractor and subcontractor; no work, according to this report in June—well, according to this report, which was just filed, no work has been started on that just yet, but will Roane-Anderson Co. get any fee out of that contract?

Mr. COOK. They will not, sir.

Senator HICKENLOOPER. Item No. 46, construction group No. III—roadway and sidewalks; Roane-Anderson Co. is listed as the prime operating contractor; Harrison Construction Co. is listed as the construction contractor and subcontractor. Will Roane-Anderson—have they or will they get—have they gotten any fee out of that contract?

Mr. COOK. If that is the group on roadway and sidewalk improvements for city roads and streets, they will on that one, yes, sir.

Senator HICKENLOOPER. So, they will get their percentage on that contract. That is listed, estimated cost of \$669,000. The indicated cost is \$604,000, and there is zero percentage completion. In other words, they have not started on that as yet.

Mr. COOK. That is right.

The CHAIRMAN. They have got about \$6,000 on that job then?

Mr. COOK. No, sir.

The CHAIRMAN. That is about the schedule you read.

Mr. COOK. The fee is on the aggregate, sir. It is not for each individual job, so that at the end of the fiscal year you total up all the jobs, and the fee is on the aggregate, so, as the total is increased, the fee becomes less.

Mr. WILLIAMS. It goes down.

The CHAIRMAN. I see.

Mr. WILLIAMS. That is the reason for the table.

The CHAIRMAN. When did you enter into that modification 20?

Mr. COOK. March 30, 1949; March 30 of this year, sir.

The CHAIRMAN. How much work have they done on which they have a claim?

Mr. COOK. To date, they have done under the period ending June 30, 1949, an estimated total of \$141,376. That is two separate and distinct jobs, so you subtract \$25,000 apiece or a total of \$50,000, so they will receive a fee on \$91,376 worth of work, and that fee amounts to \$1,096.

Senator HICKENLOOPER. The work is subcontracted?

Mr. COOK. Yes, sir.

May I correct that statement, sir? A part of that work covers the Oak Ridge Institute of Nuclear Studies Museum. That work was a job that was initiated late. It was felt desirable to have the museum open at the time the gates opened, and the work on that, in that instance, was actually done by the Roane-Anderson Co. The estimated cost of that job was \$50,000.

Senator HICKENLOOPER. Now, do you know whether these jobs that I have listed have been on competitive bidding by the construction contractor and subcontractors?

Mr. COOK. All construction work that is handled by Roane-Anderson is handled just like Government work. It is on competitive bidding, on a lump-sum or a unit-price basis, awarding to the lowest responsible bidder complying with the terms and conditions of the specification and invitation to bid.

Senator HICKENLOOPER. Now, there are 41 contracts in this report, January 1, 1948, to December 31, 1948, 41 contracts that have apparently been awarded, according to this report.

Of those contracts, 9 I have read are listed as Roane-Anderson being the prime operating contractor, and 32 of them in comparable amounts, some of them large—31, I should say—some of them large and some of them small, are contracts in which the AEC has operated directly with the construction contractor and not through a prime operating contractor.

In one case, which is item No. 1, a 2,500,000 gallon reinforced concrete reservoir has the Carbide & Carbon Chemicals Corp. listed as the operating contractor, but in the overwhelming bulk of those contracts they are given direct.

Now, is there any reason why the AEC cannot contract directly in practically all of these with the possible exception of a highly technical installation, or something of that sort?

Mr. COOK. Mr. Williams outlined the reasons for the procedure that we have adopted. The procedures were adopted in the over-all interest of cost savings to the Government.

Senator HICKENLOOPER. Why do you not use the proceedings in all of the cases, then, instead of using the big bulk of them as direct?

Mr. COOK. In the smaller miscellaneous alterations and revisions to existing facilities and utilities, quite a bit of that work is of such a nature that it is very difficult to attract an architect-engineer for the small jobs. They were previously handled by a small nucleus of people in the AEC organization.

By consolidating that work with the normal engineering work of the Roane-Anderson Co., we were able to reduce forces, and they now do the engineering on these small miscellaneous jobs.

On the bigger jobs we can attract architect-engineers to do the work and have done so.

Senator HICKENLOOPER. Well, let us go down the line on that. Here is \$123,000, a contract in that amount, which is direct. That is a comparatively small job.

Mr. Cook. What type of work is that, sir?

Senator HICKENLOOPER. That is a water line connecting the reservoir to the district system, and that is item No. 2 on this report.

Mr. Cook. That is an extension to an existing utility system, and that was done under a different contract, sir.

Senator HICKENLOOPER. Here is a contract for \$201,000, additional facilities for the biology division.

Mr. Cook. That was not done under Roane-Anderson, sir.

Senator HICKENLOOPER. I say it is done directly. It is a small contract, \$201,000.

Mr. Cook. That work, Senator, was done under a cost-plus-fixed-fee contract, and they are doing work for the Oak Ridge National Laboratory. It was a revision and alteration job, the type of which it is impossible to prepare plans and specifications for to receive lump-sum bids.

Senator HICKENLOOPER. Yes.

Well, then, here is one for \$127,000; that was a direct contract for the construction of a steam-distribution system. That is a small contract.

Mr. Cook. That is an alteration to an existing utility system, sir.

Senator HICKENLOOPER. Here is one for \$238,000, construction of Kerr Hollow Road. That is a direct contract.

Mr. Cook. That is a direct contract with the Commission; is it not?

Senator HICKENLOOPER. Yes. Well, you said a moment ago the small contracts were not profitable for the Commission to do them, to handle them, so they were put through Roane-Anderson Co.

Mr. Cook. That was not put through Roane-Anderson Co., the last one.

Senator HICKENLOOPER. I say it is not. You said these small contracts were more profitably put through Roane-Anderson. Here is one that was handled directly. I am reading a list of contracts that were handled directly by the Commission.

Mr. Cook. When we talk about small contracts, we are not generally talking about construction work in excess of \$10,000.

Senator HICKENLOOPER. There is not any contract that Roane-Anderson has here that is under \$100,000 that I can find. They are all over \$100,000.

Mr. Cook. I can answer your questions better, sir, if I had a copy of that which you are reading from.

Senator HICKENLOOPER. I beg your pardon. Here is one which is \$89,000. And here is a construction of a guard structure, \$137,000. That is a direct contract, and not through Roane-Anderson Co. I mean it is a small contract.

Mr. Cook. That is an entirely new facility, the design of which was prepared by Skidmore, Owings & Merrill, and it is a direct contract with the Commission—a direct prime contract with the Commission.

Senator HICKENLOOPER. Yes.

Mr. Cook. I said, if I recall correctly, that the type of work that is being turned over to Roane-Anderson is alterations, additions to

existing utilities or facilities. Now, the type of contracts that you have read off there do not fall in that category.

Senator HICKENLOOPER. Well, I think any examinations of most of these have indicated that they do.

Mr. WILLIAMS. Senator, there are a lot of those that we can hire an architect-engineer. We have Skidmore, Owings & Merrill doing a number of jobs down there, and on the jobs where we can have the plans and specifications prepared, and the work handled that way, we have done it without duplicating forces.

Now, where there is a lot of detail, where your rearranging is taking place or where you are repairing, and so on, where it takes considerable attention during the life of the contract, and the bid, the preparation of the bid under the plans, we have turned that over to Roane-Anderson Co. because they have to have a certain number of people there anyway, and we have been able to make the reductions which we have stated here by doing it that way.

Senator HICKENLOOPER. This list will be published. I mean it is a part of the public record, or will be as soon as it is put into the public record, and I shall not go down item by item. But I fail to understand why a consistent pattern of operation there cannot be installed under a single head for the efficiency of that operation down there, outside of the highly technical installations that have to do with nuclear physics or technical engineering, and other facilities.

Mr. COOK. The pattern that we are going to detail, when developed, I believe, will be a consistent pattern.

Senator HICKENLOOPER. Well, Mr. Cook, that goes right to the heart of a thing that I have been putting up with for 2½ years. This Commission is always going to do something to establish efficiency and to get forward with this program, and it is always going to do it, and it is the answer we have received for 2½ years, and we are still going down the same exact pattern that we did 2 years ago and that is a part and parcel of this situation.

Mr. WILLIAMS. Senator, the reduction in force and the figures we presented here for Oak Ridge do not indicate that we have done nothing; they indicate that we have done something. They indicate that we have, and we are going to continue.

Mr. COOK. Mr. Chairman, if I may, I would like to read a statement on what our objections and goals are at Oak Ridge, and what we have done toward the accomplishment of those goals. I think we have made remarkable progress there.

Since the Commission assumed responsibility—

Senator HICKENLOOPER. How long is it? Just a moment, please. The chairman has not said one way or the other.

The CHAIRMAN. I nodded my head. How long will it take?

Senator HICKENLOOPER. I want to know how long it is.

Mr. COOK. I think I can get through with it in 6 or 7 minutes.

Senator HICKENLOOPER. You have about 10 pages there, have you not?

Mr. COOK. Yes, but it is double spaced.

The CHAIRMAN. I think, Senator, in view of the fact that you have said they are slow in performance, it is only fair that Mr. Cook be permitted to read his estimate of the situation.

Mr. COOK. Thank you.

Senator HICKENLOOPER. All right. It is all right with me. I want them to explain these things, but I would like to finish up these details, and then they can explain any way they want to.

The CHAIRMAN. Well, it is only a 10-page statement which will only take 6 or 7 minutes.

Mr. COOK. Since the Commission assumed responsibility for the operation at Oak Ridge, its goals have been to:

1. Increase production, expand and improve the research and engineering development programs.
2. Reduce costs.
3. Install industrial and commercial cost-accounting systems, which will assure proper management and operating control as well as budget correlation and control.
4. Transfer to the operations contractors greater management responsibility for their operations.
5. Develop a long-range program looking toward a permanent community, self-government, and home ownership for residents, and ultimate withdrawal of the Commission from direct community operation through incorporation of the city of Oak Ridge as well as the sale of land and the use of long-term leases to attract private capital for our additional needs in housing, commercial enterprises, religious and social activities.

Significant steps toward accomplishment of community objectives during the last 2 years follow:

1. All production and research activities were split away, organizationally and functionally, from community operation early in 1947. In mid-1948 an Office of Community Affairs was established under which the real estate, community engineering, and other miscellaneous functions were, for the first time, separated from municipal activities.

2. An industrial-type cost-accounting system was installed under which true costs for all community operations and other functions became available. This information has facilitated far-reaching economies.

3. A master plan which provides for zoning and allocation of areas to various functions and activities to guide the physical growth and development of Oak Ridge was completed.

4. A program was initiated late in 1947 to perform long-deferred maintenance work on all physical facilities to extend the life of these facilities and to construct new permanent housing to replace substandard and other dwellings, other dwelling units, too costly to maintain.

As of today, 1,582 dwelling units are under construction, the first of which will become available in late July. Also 400 dormitory spaces are under construction to replace hutments for single persons. Already about 500 substandard units have been sold and removed. One new elementary school becomes available September 1, 1949, and a second one September 1, 1950. The construction of a new high school will begin late this month.

5. An improved Commission-contractor relationship was installed and contracts were modified giving the contractor greater managerial responsibility in the performance of his contract and transferring to the contractor numerous functions previously operated by the Commission, such as equipment and maintenance shops, engineering and

inspection work. This step has reduced duplication of functions with consequent reduction in costs.

6. A firm of consultants, the J. L. Jacobs Co., was retained to study the feasibility of incorporation, to estimate the tax revenues, and to draft a model charter under which self-government, home ownership, and private enterprise would be practicable. This report and charter are completed and are now under study.

7. Looking toward self-government, municipal costs are continuing to be reduced to permit operation ultimately by an elected municipal government. Thus, during the first 11 months of fiscal year 1949 forces of the fire department were reduced 32 percent, the police department 24 percent, the public health department 24 percent, and the recreation section 26 percent.

8. The Oak Ridge hospital operation was transferred to a nonprofit corporation organized under Tennessee laws and administered by a board of trustees composed of leading Oak Ridge citizens. Employment in that operation is down from 345 to 253 since June 1948, or 27 percent.

With respect to real estate, arrangements were completed for the sale of land to religious organizations for the construction of churches and schools for religious purposes. Negotiations of 15 sites are now under way.

The firm of Treadwell & Goldstein, recognized real-estate appraisers, was retained to survey comparative rents, utility charges, and maintenance services.

As a result of recommendations made by Treadwell & Goldstein and the Roane-Anderson Co., rent and utility charges recently were made more equitable within Oak Ridge and adjusted upward toward comparability with the surrounding areas under rent control.

In addition, a normal landlord-tenant relationship was established. This action will reduce operating costs and help attract the investment of private capital in residential building.

A commercial survey was completed which shows that Oak Ridge's retail needs are not now adequately met, and that investment of private capital in expanded shopping facilities is economically justified.

With the economic data produced by the commercial survey, representative banks, insurance companies, and investment brokers were canvassed to determine whether the development of expanded shopping facilities would be attractive to private capital. Their reaction was definitely favorable.

Site preparation consisting of grading and providing utilities for a new commercial center is not being undertaken.

A complete appraisal of all property at the Oak Ridge installation is nearing completion.

Total employment in the community operation activities has been cut 40 percent since December 31, 1946.

These major reductions are reflected both by the Commission and a majority of the principal contracts, especially during the last year.

For instance, since July 1, 1948, Roane-Anderson's pay roll has dropped from 3,193 to 1,598, or 50 percent. American Industrial Transit Co.—

Senator HICKENLOOPER. Just a minute now. Yesterday we heard that it was 1,881. Now, where do you get this figure?

Mr. Cook. I said since July 1, 1948, Roane-Anderson's pay roll has dropped from 3,193 to 1,598.

Senator HICKENLOOPER. I said, yesterday we were told that the Roane-Anderson Co. pay roll was 1,800 and something.

Mr. Cook. That is right. That includes the municipal employees, sir. I was just talking of the Roane-Anderson pay roll strictly. I cover the other later.

American Industrial Transit Co. decreased from 430 to 296, or 31 percent; municipal employees, paid through Roane-Anderson, have fallen from 508 to 305, or 39 percent; and AEC's community operation pay roll has decreased from 196 to 71, or 64 percent.

Operating costs are being decreased likewise. Approximately a million and a half dollars were cut from this year's operating budget as of January 1, and a further decrease of \$1,000,000 was recently made.

The budget for fiscal year 1950, as requested, is \$4,325,000 less than the current budget.

In production, improvements of production operations at Oak Ridge can be readily measured by comparing the present cost and rate of production of uranium 235 with similar data for earlier operations.

Since January 1947, the unit cost of producing U-235 has been reduced approximately 50 percent. This represents a saving of \$22,000,000 per year, and results from increasing the rate of production appreciably while at the same time reducing the cost of operation.

The reduction in operating costs is more impressive when it is realized that it occurred during a period of generally rising costs. Labor rates alone increased 23 percent during this period.

Senator HICKENLOOPER. I think on the question of unit production costs, just a bald statement of that kind might be misleading until we know fully the factors that go into the original cost calculations and the factors that go into the present cost calculation.

Mr. Cook. We will be very glad to give you that information, to have you go into them with us.

Senator HICKENLOOPER. I think those matters are matters, at least, that we should canvass in executive session, Mr. Chairman, without opening up those details; but I would just like to say that I dislike having a self-serving declaration of great reductions made in public, without the ability of testing the data on which these declarations are made and, therefore, I would suggest that in executive session we may very profitably go into the basis upon which these alleged cost comparisons and reductions are made.

Mr. WILLIAMS. Mr. Chairman, I might say that there is one comparison that does not need to be gone into in executive session, and that is the fact that in January 1947 in the production of U-235, we had approximately 11,000 people employed, and at the present time we have approximately 4,700 people employed, and in the meantime we have added additional programs under this program, that have taken 500, so that in effect we have reduced with the help of our contractors to 4,200 people.

Now, that is a figure that cannot be denied. That is the total employment for production.

Senator HICKENLOOPER. That certainly is a figure, and I do not question the amount of those figures, but I question the philosophy behind the employment of 11,000 people, and I question the philosophy

that exists now in a normal commercial enterprise. There are many factors that went into the retention of those 11,000 people.

Mr. WILLIAMS. Sir, I think—pardon me.

Senator HICKENLOOPER. That would have to be canvassed pretty thoroughly as to why they were retained, but—

Mr. WILLIAMS. It was due to a philosophy of trying—pardon me.

The CHAIRMAN. They are entitled though, Senator, to credit, it seems to me, for having got rid of them if they were not needed. I think that is the point that you are making.

Mr. WILLIAMS. The philosophy has been to reduce costs, and to save the taxpayers' dollars.

Now, in the main that has been the philosophy, and it is continuing to be the philosophy.

Senator HICKENLOOPER. Yes, but the only point I am making is just to say that there were 11,000 people on the pay roll at such and such a date, and only 4,000 now, does not tell the whole story.

Mr. WILLIAMS. No, sir; but the whole story would be much more impressive.

Senator HICKENLOOPER. I disagree with that. I disagree with that.

Mr. WILLIAMS. Sir, I do not think if the facts were known—

Senator HICKENLOOPER. I mean if we are just speculating and not able to go into the background, I will speculate on the other side of the thing, and say it was most inefficient, I think, up to the present time.

Mr. COOK. Those reductions in force were made possible by development, research, process improvement, management studies, that made it possible to reduce the number of people required for that operation. They were not on the pay roll because they did not have anything to do; they actually had a job to do at that time, but the process has changed considerably since that time, and improved.

Senator HICKENLOOPER. And, by the same token, we can say that we have made phenomenal reductions in the National Military Establishment because back in 1945, we had 12,000,000 men under arms, and look at the reduction we made, and we are operating the National Military Establishment at a tremendously decreased cost and, of course, that is not a fair statement.

Mr. WILLIAMS. No, sir.

Senator HICKENLOOPER. Absolutely, and there are some similar factors going into your 11,000 employment where you compare that, and say you have done a great job of reduction; there are some similar factors of background necessity and uncertainty that make that an unfair comparison just to make a blanket statement that we have reduced from such an amount down to such an amount.

Mr. WILLIAMS. No, sir. If we wanted to make a comparison such as the Senator has drawn, we could say that in August 1945, when we were at the peak of the wartime employment in the production of 235, we had 36,000 people employed for the production of 235.

Senator HICKENLOOPER. Certainly you can.

Mr. WILLIAMS. We have not taken those figures. We have taken realistic figures, sir.

Senator HICKENLOOPER. I only want to illustrate that there are factors that apply to this thing before you can test whether any such efficiency as that compares. I think you have reduced employees; I

think you have established some efficiency that did not exist sometime ago, but I think there are reasons for that.

Mr. COOK. When we go into the figures, sir, the reduction will be more impressive because in addition to doing the work that they were doing at the time the first figure was quoted, they have taken on other operations, requiring additional personnel that were not included in the original figures that we quoted.

Senator HICKENLOOPER. All right, continue with your statement.

Mr. COOK. Both the increase in rate of production and the decrease in the cost of reduction result from material improvements in operating procedures and facilities which, in turn, are the result of laboratory, engineering, and management studies.

During this same period, other work of major importance to national security has been assigned to Oak Ridge, and developed from laboratory scale to efficient scheduled production operations.

Recently, 2 years of intensive effort on the design of new gaseous diffusion facilities, have culminated in plans to construct an addition to the K-25-27 plant of greatly improved design and efficiency which will materially increase production of U-235, and decrease the unit cost.

The Carbide & Carbon Chemicals Corp., operators of the K-25 and Y-12 plants and the Oak Ridge National Laboratory, has played a leading role in making these accomplishments by its enthusiastic and aggressive approach to efficient economical operation, through co-operation in following the policies and requirements of the Commission, and their willingness to accept new problems of high priority in research, engineering, and development.

With respect to isotopes, the rate of production of radio-isotopes at the Oak Ridge National Laboratory has increased 600 percent in the last 2 years. During the last 3 months, shipments of radioisotopes averaged in excess of 500 per month. These important research tools are making valuable contributions to investigations in the fields of medical therapy, animal physiology, plant physiology, bacteriology, chemistry, physics, and industrial research.

In addition, 156 stable isotopes of 38 elements have been separated by the electromagnetic process. These are being used for research into the nuclear properties of the isotopes. As of May 31, 1949, 1,118 shipments of stable isotopes have been made.

In research, marked progress is being made in scientific research at the Oak Ridge National Laboratory, especially in the fields of chemistry, physics, biology, health physics, metallurgy, and in related development and engineering activities.

Typical examples of work on which considerable progress has been made during the past 2 years include:

1. Development of design for a materials testing reactor capable of producing high levels of radioactivity for use in determining the effect of radiation on all types of materials.
2. Conduct of numerous pilot plant experiments on plutonium and uranium separation processes, reclaiming of uranium from various solutions and decontamination and disposal of radioactive wastes.
3. Measurement of the neutron cross sections for all elements.
4. Studies on the genetic effects of radiation as observed in experiments with thousands of mice exposed to radioactivity.

The establishment of the Oak Ridge National Laboratory as a permanent institution, and its success in achieving recognition as a leader in the field of atomic research, required the development of plans for permanent facilities to replace the temporary facilities built during the war.

The first plan considered was estimated to cost \$48,000,000. Further considerations of economy resulted in the development of a final plan making maximum practicable utilization of existing facilities at an estimated cost of \$18,000,000. Of this total amount, approximately \$11,000,000 are needed for the construction of new facilities and the balance is required for the renovation of existing facilities.

Detailed plans and specifications are being prepared and construction will be initiated on the various facilities as plans become available in the near future.

On security, last fall our program of providing physical security to the Oak Ridge area was critically reviewed. A plan was evolved and later was realigned to allow for the opening of the town and to establish a controlled area excluding Oak Ridge and retaining the plant areas, which provided for the following:

A. A reasonable means of control over the number and identity of personnel in the controlled area at any time;

B. Simplified the problem of internal control by discouraging entrance of the curious or innocent intruder; and

C. A means of isolating quickly the entire controlled area in the event of need, closing off convenient methods of escape or entrance.

The CHAIRMAN. How much more of that have you got?

Mr. COOK. Just a little.

The CHAIRMAN. Can it not go into the record? I think you have given us most of it.

Mr. COOK. Just part of this page and part of the next, sir.

The CHAIRMAN. All right.

Mr. COOK. Only those persons who work in the area or who have official business in the area now have access to the controlled area. Previously all the residents of Oak Ridge and their friends had access to this area.

By this step it was possible to reduce the patrol force from 306 to 166 and maintain adequate security.

The annual cost of personnel services in the patrol, exclusive of shipment security, is now \$538,000 a year, as compared to \$938,000 prior to the opening of the town.

This represents an annual saving of \$400,000, and will amortize the total estimated cost of new fencing, patrol roads, road relocations, entrance structures, in a period of approximately  $3\frac{1}{4}$  years.

On our over-all savings, our fiscal year 1950 operating costs will be in excess of \$30,000,000 per year less than for fiscal 1947 operating costs.

That covers my statement. Thank you.

Mr. WILLIAMS. Mr. Chairman, Clark Center, the project manager for the Carbide & Carbon Chemicals Corp., is here, and if you desire a statement from him on clarifying some of the figures that we have given on production and the fact that there were actual savings and not unnecessary people on the pay roll—he is very familiar with it, and he can give it.

The CHAIRMAN. I would like to get along with Senator Hickenlooper's matters. Later if the Commission wants to bring him on, we will be glad to hear him.

Senator HICKENLOOPER. Mr. Chairman, I just sent up to the office for this. I had not intended to discuss it in the Oak Ridge situation particularly, because I had already illustrated the situation, but with respect to the high school at Oak Ridge—

The CHAIRMAN. More high schools? [Laughter.]

Senator HICKENLOOPER. Yes. I thought one high school was enough to illustrate, but I will bring in another one at Oak Ridge.

I got a letter some time ago, June 30, written to me by a man who works at Oak Ridge and lives there, in which he objects to what he believes to be the inefficiency of the operation at Oak Ridge, but incidentally he sent along a clipping on the new high school at Oak Ridge, which is to be built for 1,500 students, according to the clipping of the Oak Ridger of June 16, 1949. That, if you recall, is the same number of students as the Sousa Junior High School in Washington, and it has an auditorium and, I guess, a cafeteria and other things, and the bid on that—I do not know whether it has been accepted or not—but the report is that the bid on that is \$2,490,806, as compared to \$1,700,000 for a 1,500-capacity high school in Washington, D. C.

This same man also sent along—I cannot say this is a fair comparison; I just do not know—but he sent along the cost, and that is at a cost of \$13.42 a square foot for the high school.

This same man sent along some clippings about the types of rural high schools being built by the State of Tennessee in that area, and there is a newspaper cut of the school. I cannot tell anything from that. It may not be a fair comparison at all; I just do not know. But the rural high schools for several hundred students, according to this story, are being built by the State of Tennessee or the school authority, whoever builds them, at a cost of \$7.16 a square foot.

The CHAIRMAN. We have "monkey trials" down there, too. [Laughter.]

Senator HICKENLOOPER. The cut indicates a very modern and nice-looking high school being built by the school district of Tennessee. I do not know, as I say, and that may be an unfair comparison, but there is that comparison between that cost and the Sousa Junior High School that is being built for the same number of students.

The CHAIRMAN. Somebody told me that the Sousa Junior High School cost more money than you said it did.

Senator HICKENLOOPER. The District architect's office again verifies that that is all it will cost. I have checked that.

The CHAIRMAN. Did you check that?

Senator HICKENLOOPER. Yes, sir.

The CHAIRMAN. Was not there an editorial in the Star? I did not see it, but somebody mentioned it.

Senator HICKENLOOPER. Well, there have been a great many editorials and a great many papers that do not touch on the facts. I did not see it.

The CHAIRMAN. I mean on that specific point—that the high school cost more.

Senator HICKENLOOPER. Then the District architect's office—

The CHAIRMAN. I am not challenging it.

Senator HICKENLOOPER (continuing). Utterly misinformed me because they said positively and flatly that that was all it would cost—would be \$1,700,000.

The CHAIRMAN. Completely equipped?

Senator HICKENLOOPER. Completely equipped, and we checked it two or three times.

Mr. WILLIAMS. Senator, I do not recall what the square footage was that you said it cost—

The CHAIRMAN. Thirteen dollars.

Mr. WILLIAMS. I think we compare very well, and when you realize that we have built a civic building or armory building as a gathering place for the people, and built in the high school, and cut out a considerable amount of money in our budget, I think—

Senator HICKENLOOPER. These high schools all have community facilities in their construction.

Mr. Cook. Not the type of community facilities we have provided at Oak Ridge. We had no community facilities whatever. Our actual construction cost of our high school is \$11.37 a square foot. I do not know what figures were used in arriving at the Washington school, so that I can give you a comparative figure.

Senator HICKENLOOPER. Whatever the square footage was, it was \$2,490,806.

Mr. WILLIAMS. Senator, I do not know if that includes the preparation of the site, and so on.

Mr. Cook. Does that include design and inspection?

Senator HICKENLOOPER. As I say, I was not prepared to bring this high school question up at all, but the talk about the high school came up in a statement this morning, and I had received this complaint and this statement, and I put it into the record for what it was worth.

Mr. Cook. I think we should compare our high school with Knoxville, and our costs compare very favorably with those at Knoxville.

Senator HICKENLOOPER. I ask you, Mr. Cook, at the outset, and I do not know that we got the figure in, whether you have the periodic total employment pay roll of Roane-Anderson on this date, February 16, 1949, when Mr. Ford said there were 2,501 employees, down to and including the date where you said yesterday that as of June 13, there were 1,800-and-some employees?

Mr. Cook. Yes, sir.

Senator HICKENLOOPER. I mean, could you give us a periodic monthly total of Roane-Anderson employment so that we can have a little table on this for 3, 4, 5 months back? Do you have that here? You do not need to break them down because I have checked the break-down as given here, and the break-down as given yesterday, and between February and the 13th of June, it seems that the reduction in force has been relatively in various departments, so you do not need to break them down each time. Just give me the total number of employees altogether on the Roane-Anderson pay roll of various dates.

Mr. Cook. This table is broken down showing the total employees on Roane-Anderson pay roll, and a separate figure for the municipal employees. Would it be all right if I gave you those two figures?

Senator HICKENLOOPER. Yes, you can give the two. I can add them.

Mr. Cook. All right. On January 4, 1949, Roane-Anderson, 1,983; municipal, 660. On January 17, 1949, Roane-Anderson, 1,882; municipal, 661. On January 31, 1949, Roane-Anderson, 1,842; municipal, 659. On February 14, 1949, Roane-Anderson, 1,780; municipal, 637. On February 28, 1949, Roane-Anderson, 1,756; municipal, 655. On March 14, 1949, Roane-Anderson, 1,719; municipal, 385. On April 4, 1949, Roane-Anderson, 1,798; municipal, 299. On April 18, 1949, Roane-Anderson, 1,760; municipal, 299. On May 2, 1949, Roane-Anderson, 1,723; municipal, 295. On May 16, 1949, Roane-Anderson, 1,699; municipal, 293. On May 30, 1949—no, that is not filled out yet. That is as far as this table goes, sir.

Senator HICKENLOOPER. That would be May 30, 1949?

Mr. Cook. That is right. The other column has not been added up yet, sir.

Senator HICKENLOOPER. The last figure you have is May 16, 1949. You started to give me the figure for May 30, and I think you said the figure was not added?

Mr. Cook. That is right. The 16th were the last figures you had.

Senator HICKENLOOPER. But you gave me the figures yesterday for June 13, with the figures of 1,881 as a total.

Mr. Cook. That is right, sir. That was the total figure, was it not, sir?

Senator HICKENLOOPER. That was the total figure, as I understood it.

Mr. Cook. Yes, sir.

Mr. WILLIAMS. That included municipal employees.

Senator HICKENLOOPER. Yes, but you do not have the figure there for the last of May—the 30th of May?

Mr. Cook. I have. For the 30th of May, the Roane-Anderson figure was 1,598, and the municipal was 305.

Senator HICKENLOOPER. Yesterday I mentioned the matter of the cost of the installation of steps and sidewalks at these various houses. The figure I have is that the cost of the steps and the sidewalks for the houses was \$263 an installation.

Now, I left the meeting yesterday believing or thinking that that meant the sidewalk running in front, the width of the house. I am told that that is the cost of merely the steps and sidewalk out to the street in these houses, and that the cost averages \$263 per installation, and that it is not the cost of the sidewalk, if any, along the entire front of the lot; is that correct?

Mr. Cook. I will have to consult on that. That is the sidewalks from the front and to the side and back door, from the house to the street.

Senator HICKENLOOPER. Most of the houses are in the middle of the block. It is only the corner houses that would have a walk from the street to the side door.

Mr. Cook. A walk leading from the front to the front entrance and from the front entrance to the side door.

Senator HICKENLOOPER. Do you know the average length and width of that walk?

Mr. Cook. I cannot give a reasonable estimate, but I can check it.

Senator HICKENLOOPER. Are not those houses a fairly standard distance back from the street?

Mr. Cook. There is no uniformity whatsoever; by reason of the terrain the houses were located where it was possible to locate them,

and in each instance the sidewalk conditions are different. Some require many steps, some do not require any steps at all. Some are sitting way back from the road and some are setting close to the road.

Senator HICKENLOOPER. I realize there may be a few isolated houses at a great distance back from the road, but what would you say would be the farthest distance back from the road that a great many of these houses might be?

Mr. COOK. Some of them, sir, are in excess of 150 feet. I would say the average distance is approximately 60 feet. It all depends on where the location is.

Some of them are quite close to the sidewalk.

Mr. WILLIAMS. But that 60 feet does not include the walk going around to the side door.

Senator HICKENLOOPER. That would probably be about an average of a 30-foot walk.

Mr. WILLIAMS. Senator, we made some statements here—Mr. Cook made them on guesswork yesterday—and we would like to correct those if you have no objection.

Senator HICKENLOOPER. I would like to have as accurate figures as possible.

Mr. WILLIAMS. It is on the garbage.

Senator HICKENLOOPER. Let us have those. They are very interesting.

Mr. WILLIAMS. I would like to get rid of them.

Senator HICKENLOOPER. All right.

Mr. COOK. On March 18, 1948, an AEC work authorization was issued to Roane-Anderson in the amount of \$106,500 for the construction and installation of approximately 3,550 units at an estimated cost of \$30 each.

Senator HICKENLOOPER. How big were those units?

Mr. WILLIAMS. The final units were 26 inches by 26 inches for each garbage can. That is, the slab.

Mr. COOK. May I proceed, sir?

Senator HICKENLOOPER. Yes. How big were the units, the 3,550 units? How big was each unit?

Mr. COOK. The inside measurements of the enclosure and the size of the precast slabs are 2 feet 6 by 5 feet zero.

Senator HICKENLOOPER. That is for two garbage cans or a garbage can and a trash can, something like that?

Mr. COOK. The way these were constructed was that the concrete precast slabs were purchased on competitive bidding. The enclosures themselves, built in panels, were purchased on competitive bidding.

Senator HICKENLOOPER. By the "enclosures" what do you mean?

Mr. COOK. The posts, the rails, and the pickets.

Senator HICKENLOOPER. Will you describe the installation of the fence around the garbage cans or just describe what they consisted of. What were the sizes of posts? What was the type of pickets?

Mr. COOK. Four-by-four posts 5 feet long. Two-by-four rails, one-by-four pickets, with two coats of paint.

Senator HICKENLOOPER. One-by-four pickets?

Mr. COOK. The concrete slabs were purchased precast on competitive bidding. The enclosures were purchased in panels on competitive bidding, including all materials.

Senator HICKENLOOPER. What do you mean, "the enclosure was purchased in panels"? Do you mean the four-by-four, each one had 4 four-by-fours, one at each corner?

Mr. COOK. No. In all instances there was not a complete enclosure. In other words, if by reason of the location of the house you only needed one end and one side panel, that is all that was placed there. The actual material cost totaled \$49,825. The actual labor cost totaled \$15,759. The total cost is \$65,584, or a unit cost of \$18.32 each.

I would like to point out that the houses in Oak Ridge are built without basements, with kitchens facing the street, because it was impossible in that type of terrain to construct alleys or back yards where you normally keep your garbage cans. This item was considered as a deferred capital-cost item that should have been included in the original construction.

Senator HICKENLOOPER. What happened to the rest of the \$346,000 that was contained in the budget for this item?

Mr. COOK. That is part of the money that was turned back to the Commission.

Senator HICKENLOOPER. I see. Now, was there a wooden base or how were these slabs installed?

Mr. COOK. The ground was leveled and, if necessary, some fine crushed stone was placed to help level the slabs up, if it was in rocky ground, and they were just laid on top of the surface of the ground.

Senator HICKENLOOPER. Now, do you have the figure there as to how much these slabs themselves cost?

Mr. COOK. Yes, sir. The slabs cost—

Senator HICKENLOOPER. I have the total figure for materials of \$49,825.

Mr. COOK. The slabs cost \$1.34 each. We received six bids on that, and that was the lowest of the six bids received.

Senator HICKENLOOPER. All right. Incidentally, in the Oak Ridge installation I would like to ask you what the railroad arrangements are there. How much trackage does the Commission operate in Oak Ridge? Just give us a whole statement of that. What does the Commission pay to the railroad companies for operating switch engines and other installations there at this time? I know something about what it used to be.

Mr. COOK. I can give you approximate figures, sir. I cannot give you the exact figures unless Mr. Ford has them. There are two railroad connections to the area. At the west end of the area the K-25 manufacturing area is connected to the Southern Railway at Blair.

Senator HICKENLOOPER. Who built that spur?

Mr. COOK. That spur was initially built during the original construction period by J. A. Jones Construction Co., who built the K-25 plant. The line is owned and the right-of-way is owned by the Government.

Senator HICKENLOOPER. Now, what does the other end of the installation—

Mr. COOK. Do you want me to add a few notes?

Senator HICKENLOOPER. Tell us about it. How much does it cost us to operate? What do we pay?

Mr. COOK. I have some physical data here. At the K-25 connection with the Southern Railway we have a main line of approximately 10.7 miles and yard siding of 12 miles, or a total of 23 miles.

Senator HICKENLOOPER. Is that within the area itself on Government land?

Mr. Cook. The yard siding is within the Oak Ridge area itself, but the main-line connection from Oak Ridge to the Blair main line is—

Senator HICKENLOOPER. Ten-point-something miles.

Mr. Cook. That is not quite 10 miles. Our main-line track is 10 miles, but that is about 6 miles.

Senator HICKENLOOPER. How much mileage is there from the Blair gate to the entrance to the Government reservation or Government land? How much trackage is there there?

Mr. Cook. Approximately 6 miles.

Senator HICKENLOOPER. Six miles?

Mr. Cook. Yes.

Senator HICKENLOOPER. That right-of-way is owned by the Government?

Mr. Cook. Yes, sir.

Senator HICKENLOOPER. That is between the reservation and the Blair connection?

Mr. Cook. That is right.

Senator HICKENLOOPER. All right. Then the rest of approximately 4 miles remaining of the 10 miles—is that within the Government reservation?

Mr. Cook. Yes, sir; plus the yard siding of approximately 12 miles.

Senator HICKENLOOPER. We will get to that in a second. Now, then, that is the complete spur that comes in. Then your yard siding hooks onto that; is that correct?

Mr. Cook. That is right.

Senator HICKENLOOPER. So that there are 4 miles entirely on Government land. Who owns that 4 miles of this spur?

Mr. Cook. The Government owns it.

Senator HICKENLOOPER. The Government owns the right-of-way?

Mr. Cook. The Government owns the right-of-way and the track.

Senator HICKENLOOPER. Owns the whole thing from the Government reservation line into Oak Ridge?

Mr. Cook. Yes, sir.

Senator HICKENLOOPER. How much siding is there that connects with that?

Mr. Cook. Approximately 12 miles.

Senator HICKENLOOPER. Twelve miles of siding. Does the Government own all that?

Mr. Cook. They own all the land and all the siding.

Senator HICKENLOOPER. What is the other connection into Oak Ridge?

Mr. Cook. The other connection into Oak Ridge is on the east end of the reservation with the Louisville & Nashville Railroad.

Senator HICKENLOOPER. Yes. Where does it connect?

Mr. Cook. That connects right at Elza gate.

Senator HICKENLOOPER. In other words, the Louisville & Nashville runs right past the Government reservation line.

Mr. Cook. It does. It is about half a mile away, but runs parallel.

Senator HICKENLOOPER. The spur for the half mile between where it connects and the Government land—who owns that?

Mr. Cook. The Government owns it.

Senator HICKENLOOPER. The Government owns the track from the reservation to the Elza gate?

Mr. Cook. To the main connection with the main line of the Louisville & Nashville Railroad.

Senator HICKENLOOPER. How much mileage of this particular connection is there from the beginning of the Government-owned land—that is, the Government reservation—into Oak Ridge?

Mr. Cook. From the main-line connection to the warehouse area in Oak Ridge it is approximately a mile and a half or a mile and three-quarters.

Senator HICKENLOOPER. Now, then, is there siding that hooks up to that?

Mr. Cook. There is approximately 35 miles of track, which includes siding, and the Louisville & Nashville operates it.

Senator HICKENLOOPER. Then there would be about 33½ miles of siding; is that correct? You say there is 35 miles including siding.

Mr. Cook. At the beginning of this fiscal year we had approximately 35 miles of main-line track and siding.

Senator HICKENLOOPER. All together?

Mr. Cook. All together.

Senator HICKENLOOPER. What I am trying to get at is the Louisville & Nashville line from where it hooks on at the Elza gate into the reservation. Where is that that the Louisville & Nashville siding hook-up ends? How much trackage is there from Elza gate up to the warehouse?

Mr. Cook. From the Elza gate to the warehouse there is approximately 2 miles of track, a mile and three-quarters. That track extends—

Senator HICKENLOOPER. Yes. Then, from the warehouse area what happens? What is hooked onto that?

Mr. Cook. That tract extends to the Y-12 area.

Senator HICKENLOOPER. How far is that beyond the warehouse?

Mr. Cook. That is approximately another 4 to 5 miles.

Senator HICKENLOOPER. Now, how much siding is there connected with this Louisville & Nashville hook-up, if you can divide it?

Mr. Cook. I would say there is approximately 10 miles of main-line track and 7 miles of siding. That figure of 35 miles that I gave you was the figure at the beginning of this calendar year and we have reduced the amount of track operated to a total of 17 miles.

Senator HICKENLOOPER. Let's get the whole thing. How many miles of siding in total with both hook-ups is there? That is, the Southern Railway's connection and the Louisville & Nashville connection. What is the total mileage of the siding all together in Oak Ridge?

Mr. Cook. My estimate is approximately 19 miles.

Mr. WILLIAMS. Senator, what was the last question, please?

Senator HICKENLOOPER. I asked just how many miles of siding there are in Oak Ridge all together.

Mr. Cook. I gave a figure of approximately 19.

Senator HICKENLOOPER. There are 19 miles of siding all together. That includes the siding hooking up with the Southern Railway and the siding hooking up with the Louisville & Nashville Railroad?

Mr. Cook. Yes, sir.

Senator HICKENLOOPER. So it is 19 miles of siding. Then how long did you say the entire Louisville & Nashville main track was from Elza gate?

Mr. COOK. I said approximately 10 miles of main-line track and 7 miles of siding for the Louisville & Nashville.

Senator HICKENLOOPER. Now, how much main-line track is there from the place of the Southern Railway hook-up?

Mr. COOK. On the Southern there is approximately 10 miles of main line and 12 miles of siding.

Senator HICKENLOOPER. Now, does the Government own all of this land and all this siding within the reservation and all the main line within the reservation?

Mr. COOK. And the connecting track and rights-of-way to the main line of the Southern and the Louisville & Nashville Railroad.

Senator HICKENLOOPER. All right. Now, the rolling stock that is operated in there—who owns that?

Mr. COOK. The rolling stock that is operated there is owned by the railroads. The locomotives, the Diesel engines are owned by the Government.

Senator HICKENLOOPER. How many of those do you have within the reservation?

Mr. COOK. Right now we have three.

Senator HICKENLOOPER. How many does the Government own there?

Mr. COOK. We have three.

Senator HICKENLOOPER. And you own three?

Mr. COOK. Yes, sir.

Senator HICKENLOOPER. Do those Diesels go out on the main line of either of these railroads other than to possibly pick up cars or trains?

Mr. COOK. No; the only time they go out on the main line is when there are transfers of material coming in.

Senator HICKENLOOPER. That is for the direct use of the project?

Mr. COOK. Yes.

Senator HICKENLOOPER. You do not go to some other town down the line and pick up cars and bring them into the station?

Mr. COOK. No, sir.

Senator HICKENLOOPER. Now, who maintains this trackage within the reservation and the rights-of-way hooking up with each of these two railways?

Mr. COOK. The track is operated for the Government and maintained by—in the case of the Southern Railway we have a no-fee contract with the Southern Railway for the operation of the west-end railroad facilities and the maintenance of the track.

Senator HICKENLOOPER. Let us take the 10 miles from where it hooks up with the Southern Railway and comes up to the reservation line. Who maintains that right-of-way?

Mr. COOK. That right-of-way is maintained by the Southern Railway under a contract with the Commission. It is a no-fee contract. We pay the cost of maintenance of the track through a contract with the Southern Railway.

Senator HICKENLOOPER. Do you pay the sections hands and the cost of the equipment and the cost of the repairs?

Mr. COOK. We do.

Senator HICKENLOOPER. You pay all costs of the maintenance of that line from the place where it hooks up with the Southern Railway to the reservation line; is that correct?

Mr. COOK. That is right.

Senator HICKENLOOPER. Who pays the cost of the maintenance of the half-mile of Louisville & Nashville from Elza gate to the Oak Ridge reservation?

Mr. COOK. As to the L. & N. track, formerly we had a contract with the L. & N. that was a no-fee cost-type contract for the operation and maintenance of all the track facilities and equipment in the east end of the community.

Senator HICKENLOOPER. Then, does the L. & N. maintain that half-mile of track, or the amount of track from Elza gate to the reservation line?

Mr. COOK. The track that connects our track facilities with the L. & N. at Elza gate is Government-owned track on Government-owned right-of-way.

Senator HICKENLOOPER. I am trying to find out who maintains it.

Mr. COOK. Under the contract, the type of contract we had with the L. & N., it is a no-fee cost type of contract where we reimburse them for the maintenance of that track.

Senator HICKENLOOPER. So the L. & N. maintains the track from the Elza gate to the reservation line, and the Government reimburses the L. & N. for that cost of maintenance?

Mr. COOK. The Government reimburses the L. & N. for the maintenance of the Government-owned track from the point of connection to Oak Ridge.

Senator HICKENLOOPER. That is exactly what I mean. Now, then, does the L. & N. maintain the track within the reservation, the L. & N. track within the reservation?

Mr. COOK. The L. & N. maintains the track within the reservation.

Senator HICKENLOOPER. And the Government reimburses the L. & N. for the cost of that track maintenance?

Mr. COOK. That is right.

Senator HICKENLOOPER. And for the replacement of materials such as rails and ties and other equipment; is that correct?

Mr. COOK. That is right.

Senator HICKENLOOPER. Who maintains the track from the reservation line into Oak Ridge on the Southern Railway connection?

Mr. COOK. There is the same arrangement with the Southern Railway.

Senator HICKENLOOPER. The Southern Railway furnishes the section hands and maintenance people?

Mr. COOK. And we reimburse them for the cost.

Senator HICKENLOOPER. And the Commission reimburses the Southern for the costs of the replacements such as rails and ties and for the maintenance of the rights-of-way and the system; is that correct?

Mr. COOK. That is right.

Senator HICKENLOOPER. Does that apply in each case to the siding that hooks up with each railroad?

Mr. COOK. The maintenance on the siding is performed as directed by the Commission, and when it is performed, it is reimbursed by the Commission.

Senator HICKENLOOPER. And it is performed by the respective railroads that operate into that siding?

Mr. COOK. That is right.

Senator HICKENLOOPER. Does the Government own any rolling stock there other than the three Diesel engines?

Mr. COOK. No, we do not.

Senator HICKENLOOPER. Who operates the Diesel engines? Are they employees of the Commission or of the railroads?

Mr. COOK. The operators of the Diesel engines are employees of the Southern Railway who are part of that unit organization that operates and maintains the railroad facilities at the west end of the reservation.

We have recently concluded a contract with the railroad—at least, I think it has been concluded—where they furnish steam locomotives and we operate on an hourly rate, which will save us cost of operation of our facilities in the east end.

Senator HICKENLOOPER. That is, steam locomotives within the area?

Mr. COOK. They will be operated within the area in the east end of the Oak Ridge area, and those locomotives will be furnished by the L. & N. and operated by the L. & N. for the time that they are in the reservation.

Senator HICKENLOOPER. Now, the engineers and the firemen, and so on, on these locomotives and the brakemen who operate in the movement of cars—whose employees are they?

Mr. COOK. They are employees of the railroad.

Senator HICKENLOOPER. Of the railroad. And they are reimbursed by the Commission; is that correct?

Mr. COOK. The Commission reimburses the railroad and they in turn pay the employees.

Senator HICKENLOOPER. Yes. And that is for switching cars and spotting them and things of that kind within the reservation; is that correct?

Mr. COOK. That is right.

Senator HICKENLOOPER. How much does the Commission pay the L. & N. for this service altogether?

Mr. COOK. May I check and see if we have those figures?

Senator HICKENLOOPER. Yes.

Mr. COOK. We do not have the cost figures with us, sir. We can get them.

Senator HICKENLOOPER. As to Government freight, when a carload of material comes in, does the Government pay freight, for instance, from the Elza gate to the warehouse?

Mr. COOK. No. The nearest waybill station is approximately 6 miles from Elza gate.

Senator HICKENLOOPER. For instance, you want to get a carload of stuff from some place. Where does the freight begin and where do you stop paying freight on that? You pay freight from Gary, Ind., for instance, if you want a carload of steel. Do you pay the freight from Gary, Ind., to Elza gate, or do you pay it to Oak Ridge?

Mr. COOK. You pay it to the nearest—I do not know the proper terminology—waybill station, and if you are 6 miles one way or the

other, you pay the same freight rate. So the freight paid really is to this station.

Mr. WILLIAMS. Blair?

Mr. COOK. It is not Blair. It is outside the reservation. But the L. & N. delivers it to our siding for the original freight rate, and then the reservation operation or the Government operation, if you want to call it that, starts from that siding and brings it into the area.

Senator HICKENLOOPER. And that operation, then, is completely Government from that time?

Mr. COOK. It is completely Government-reimbursed from that time.

Senator HICKENLOOPER. I mean the Government picks it up and pays all the bill from that into the reservation to where it is spotted at the warehouses or other places.

I would like to know what the cost to the Government is, what the Government pays to the L. & N. and to the Southern Railway for all maintenance, including wages, salaries, and engineers and motor-men from the point of connection at the Elza gate into the reservation on the L. & N., and from the point of connection on the Southern Railway into the reservation where this freight is spotted.

I would like to know just how much the Commission is paying in total to the L. & N. and in total to the Southern Railway. I am not talking about the freight from a place of purchase of merchandise to a billing station. I am talking about what they pay them in addition to freight rates on merchandise, what they pay them for the whole maintenance of that system that you have described and the personnel and things of that kind.

Mr. WILLIAMS. I think it would be well for us to point out, too, that we do not pay freight as such on the section on which we pay for the hauling of cars.

Senator HICKENLOOPER. I understand that these are billed customarily to the nearest waybilling station.

Mr. WILLIAMS. Outside the reservation.

Senator HICKENLOOPER. I understand that.

I wish you to furnish those figures for the record.

Mr. COOK. We will do so.

Senator HICKENLOOPER. Now, on this matter of town management and operations of that kind, we have gone through for illustration and used a number of instances in Hanford, Los Alamos, and Oak Ridge.

As I have said before, Mr. Chairman, I have literally hundreds of individual letters of complaint on operations of this kind. I propose to turn this whole volume of correspondence over to the committee for its more intimate examination by whatever method the committee determines it wants to proceed. I do not intend to further prolong these hearings by individual detailed complaints on certain individual items, but I think the committee should take them and I hope the staff can examine them and look into these matters on staff time.

Personally, I think that there are some very startling things that have developed about Los Alamos and about Oak Ridge. I frankly have never been able to tell what it costs to operate the town of Hanford. The bookkeeping system is so interlocked that it has been impossible for me to make heads or tails out of the cost of the operation of Hanford; and so I have been unable to go into the town-management

operations of that very much, but we may be able to develop that a little later.

I would like to mention at this time, in the nature of notice to the committee and anybody else, that I want to go into a little bit, as much as I can in open session, the matter of the reactor program. I will preface that by saying that it is generally conceded—and as far as I am concerned, I do not need to talk to you gentlemen from Oak Ridge any more, since this will not involve Oak Ridge—I might say that the reactor program and its development has always been one of prime urgency in the requirement for the progressive development of atomic energy.

With regard to the costs, I want to use some illustrations here in the few minutes that are left. I want to read from this same report on contracts that is to become later a public document, as soon as it is printed, and this is with respect to the Chicago operations office.

I want to read what the Commission itself says about this. I am reading from this report, as I say, that I referred to awhile ago. The Commission itself says as follows:

Various figures representing the total estimated cost—  
this refers to the Chicago operations office—

have been considered ranging from \$25,000,000 to \$100,000,000, but with no real engineering basis for cost estimates. With the passage of the Atomic Energy Act of 1946 and the recognition of the need for intensive research and development of many aspects of atomic energy, the judgments as to the size of the facilities at Argonne National Laboratory were considerably enlarged. This judgment was further expanded in January 1948 when the Commission announced its decision to make the Argonne Laboratory its reactor-development center—

Mr. Chairman, I call your attention to their own statement in 1948 that they were going to make Argonne the reactor center—

while continuing to look to ANL for major research in the physical and biological sciences. The earliest assessments of requirements after this decision resulted in a figure slightly over \$100,000,000 for the total cost of the laboratory. This was later cut down to \$57,000,000 by rather arbitrary reduction in contemplated facilities. But this was the basis of a contract supplement between the Commission and the University of Chicago. A few months later as engineering data became available it was apparent that the cost of the facilities contemplated at the time the \$57,000,000 figure was arrived at would probably be closer to \$84,000,000. In February 1949 a revised proposal submitted to the Commission was approved for a plan calling for reduced and rearranged facilities estimated to cost \$63,700,000 which included funds for an experimental reactor. Eliminating the reactor funds because of a possible transfer of location the estimate for the Du Page County facilities now becomes \$61,100,000. However, this amount includes \$5,450,000 for the estimated construction cost of a biology laboratory building allocated to program class 630, which in this record is listed in line 3, and accounts for the \$55,650,000 record as the indicated cost in line 1.

That statement is beyond my analysis. To continue:

Line 2: The Cancer Research Hospital, program 630, estimated to cost \$4,500,000 is financed separately from the facilities included in line 1, program No. 430. Bids are about to be received for this project.

Line 4: The principal items, the laboratory and administration buildings, are estimated to cost \$2,750,000. Fundamental drawings and specifications are now in process. The remainder covers alterations to existing buildings and miscellaneous improvements.

The Dick Construction Co. is general contractor for hangar alterations.

Ford, Bacon, and Davis has the general cost-plus-a-fixed-fee subcontract for the east area facilities with the University of Chicago. It has subcontracted

various service contracts which are included in the total cost of the project. These subcontractors are as follows:

- Ragnar Benson, Inc., construction, cost plus a fixed fee.
- N. J. Corby Co., plumbing, etc., cost plus a fixed fee.
- Hanley & Co., heating and ventilation, cost plus a fixed fee.
- J. Livingston & Co., electrical, cost plus a fixed fee.
- Metal Structures, Inc., hut structures, fixed price.
- Welso Construction Co., general construction, fixed price.
- Seneca Petroleum Co., road paving, fixed price.

The Austin Co. has the general cost-plus-a-fixed-fee subcontract for the west area facilities with the University of Chicago which has service contracts as follows:

- Livingston, Kelso-Burnett & Fries-Walters (joint venture), electrical, cost plus a fixed fee.
- Hanley & Co. mechanical, cost plus a fixed fee.

In the New York operations, which refers to the Brookhaven set-up, the Commission's statement says:

The H. K. Ferguson Co. started construction August 11, 1947.

The following companies are subcontractors to H. K. Ferguson:

- Electrical work, L. K. Comstock, cost plus fixed fee.
- 300-foot concrete chimney, Alphons Custodis, lump sum.
- Heating, ventilating, and air conditioning, Baker Smith, lump sum.

The estimated cost of the entire pile complex shown on the tabulation was a working estimate as of July 1947 based on very meager information. The pile itself was originally contemplated to be a duplicate of the one at Oak Ridge but this concept was changed and an entirely different pile was agreed upon. From that time on the project was new, with no past experience to use as a guide. Each step required proving before being incorporated in the design. To be the effective instrument of research that it was intended to be the new pile and its numerous contributing facilities were required to be as near perfect as scientific ingenuity and skill could make them. This required constant changes as new and better ideas and methods were evolved. During the construction estimates were increased because of rising costs of labor and materials.

It is my understanding that it is generally conceded, Mr. Chairman, that labor and materials have been going down any place from 10 to 15 percent. I continue reading:

Budget estimates were also revised during this period to reflect increases over originally estimated costs.

2. The increase in indicated final cost over the original estimate was due to the impossibility of properly estimating time and materials before drawings were much further advanced. This project involved new ideas for which there was no background of experience to use as a guide.

3. The only construction contract awarded to date was to H. K. Ferguson Co. for machine foundation. This work was rushed in late 1948 as a supplement to the Ferguson contract to enable the heavy foundation to be placed before winter set in, as it is necessary that this foundation attain complete settlement before other construction is started. Development of plans indicates original estimate may be exceeded by 10 percent.

4. Increase in final cost on this lump-sum contract was due entirely to field changes found necessary during progress of construction.

5. Increase in final cost on this lump-sum contract was due to the fact that it was deemed necessary to install additional facilities over those originally planned.

6. The amount first budgeted was \$200,000 but this was prior to the time the present buildings had been acquired. The estimate shown, based on preliminary plans for alterations to buildings may be exceeded by 10 percent but this will not be established until plans are further advanced.

7. Lowest of the six bids received was approximately \$200,000 higher than the amount which had been estimated.

8. Increase over bid amount due to field changes found necessary.

9. Increase of 18 percent due to increase in labor rates and material costs between July 1949 when estimate was made and January 1949.

10. Increase in final indicated cost due to increase in labor rates and material costs, and to an expansion of the medical and health provisions. The architect-

engineer was not in a position to estimate the engineering requirements needed to meet the medical and health specifications set for plant operation. These requirements are particularly responsible also for the fact that brand-new types of equipment have had to be designed in place of certain existing equipment originally intended to be used.

11. Since the estimate shown was made, additional study indicates that the cost was underestimated. A figure closer to realism would probably be \$1,865,000 but plans have not progressed sufficiently to actually use that figure as an estimate.

Now, in connection with that and particularly in connection with paragraph 2 above, I have a very interesting letter here which I will read. This man was chief of construction for the Ferguson Co. at Brookhaven in the pile construction operation. This is dated June 16, 1949, addressed to me, and reads:

DEAR SENATOR: In connection with current investigation of AEC you may be interested to know the following:

In 1947, contract was placed with the H. K. Ferguson Co., engineers and builders of Cleveland and New York for design and construction of the "first peacetime" atomic pile and auxiliary structures to be built for the Associated Universities at Brookhaven National Laboratory, Upton, Long Island, N. Y. Work was to be completed in a year at an estimated cost of about 16 million. Almost 2 years after ground breaking in August 1947, pile is not operating and final predicted cost will be 23 million.

The assumption that design and construction could economically proceed together was a fallacy, and subsequent delay in construction through lack of plans was responsible for much of the added cost.

Another example of the inept planning was the purchase of a steam heating plant for the project, from the Kentucky Ordnance Works, Paducah, Ky. This plant was dismantled, shipped (over 50 carloads) unloaded and stored at Upton, L. I., and resold and shipped to Hanford, Wash.

I held the position of chief of construction for the project with the Ferguson Co. from August 1947 to January 1949 and am in position to be familiar with this project.

Yours truly,

SUMNER C. WILLIS,

*Westfield, N. J., Member of American Society of Civil Engineers.*

With respect to the Chicago situation, there is a statement which has been received here by me with a letter of transmittal on June 4. It is from Mr. Louis H. Goeltz, of Milwaukee, and is in the nature of a report on what he believes to be substantial waste in the Chicago operations. He has had some connection with the Chicago operations and that is the only reason I read it and it is not in the nature of a collateral observation. It reads:

Whoops—There goes our money again. By Louis H. Goeltz.

When the Government does it, watch out, and that's just what we should do—watch out.

In my opinion the ordinary citizen should report any incompetent and wasteful handling of work that he comes in contact with providing he has substantiated evidence to back up his claims.

I am submitting the following report:

The Atomic Energy Commission (AEC) in conjunction with the Chicago University are designing and building the Argonne National Laboratory project located near Chicago, Ill.

Initial work for the project is known as Temporary Facilities, consisting of a temporary project complete in itself with a group of 24 quonset hut buildings in single and multiple units and including a power house, sewage disposal, water supply, gas and compressed air systems, roads, sidewalks, and so forth. All these facilities will be duplicated again in the permanent project.

I have been connected with construction projects over a long period of years but this project was by far the most incompetent, unorthodox and wasteful I have ever been connected with.

This temporary project must not be confused with the permanent project at present being designed and built near by.

Originally the design for both the temporary project and the permanent project were to be handled by a New York City firm of architects with temporary offices in the Chicago Loop and their personnel were hired on the basis of approximately a 5-year period. Well—something went haywire and both architects and their personnel were terminated at the completion of the design for the temporary project and another firm of New York City architects are at present designing the permanent project in their New York City office.

When personnel were hired it was necessary to take the oath on communistic matters and be fingerprinted; pictures were also taken which had to be worn while in the office. The pictures were set in a white background and after we were investigated by the FBI which sometimes took as long as 5 months and if cleared the pictures were removed from the white background and put on a red background.

It would seem, parenthetically, Mr. Chairman, that they should reverse the colors. If they would make them red first and white afterward, it would be all right.

To continue:

There was nothing at all special about the building designs or room lay-outs and no reference whatsoever was made to matters of atomic research, not a thing of value to anyone, yet armed and uniformed guards were on duty at the office and the site day and night.

The idea that the Quonset hut buildings were economical for this type of project soon proved a fallacy as it was necessary in most buildings to provide steel structures and supports within the buildings to support piping and equipment. Furthermore, due to the curved roofs and sides of the huts, the design and installation problems were ever numerous and bothersome.

A very expensive kitchen and cafeteria with double service counters were included in the project with the kitchen twice the size of the dining room and this arrangement will prove very inefficient as the small dining room will be inadequate to properly handle the amount of persons served. The usual practice for the kitchens and cafeterias is at least a dining room approximately twice the size of the kitchen (just the reverse of the above) and an original plan on this basis with one serving counter was canceled.

Someone was also very lavish with our money when they bought the best and most expensive kitchen fixtures and equipment obtainable and for installation in a Quonset hut and a temporary project; no better or more expensive equipment could be found in our finest hotels.

Besides a large force of architects and engineers, the office included a very large personnel consisting of employment of personnel, listing materials, purchasing, estimating, pay roll and general office help, et cetera. Turn-over of personnel both of low and high rank was also very large.

It is always the practice for contractors to list and purchase material for jobs through their own competent employees, not so on this project, for, with the exception of material for heating and ventilating, these items were taken care of by the office personnel with very wasteful results.

If the proper authorities will check the cost records for construction work at the site and the cost records in connection with the design and the extra office personnel, they will find that we are paying an exorbitant sum of money for the type of completed project we are getting.

The cost of this temporary project, probably \$6,000,000 or more, is indeed an itty bitty amount in comparison to the other \$50,000,000 AEC projects and the incompetent and wasteful handling of this temporary project will no doubt be brushed aside by Messrs. Lillienthal, Wilson, and the Chicago University as being too trivial to bother with. Will it not be pertinent to inquire that, if conditions as pointed out on this small project are so bad and wasteful, what's happening on the larger projects? Messrs. Lillienthal and Wilson should take a trip out to this project and see how the taxpayer's money is being spent.

As for the General Manager, young Mr. Carroll Wilson—

the only reason I am reading this particular paragraph, Mr. Chairman, is it is in the letter and I am putting the whole thing in so it will be in the record; I have not raised any issue on this matter.

To continue:

As for the General Manager, young Mr. Carroll Wilson, age 34; with all due respect and credit for his being a very bright young man, hasn't lived long enough to absorb the know-how necessary for handling these gigantic and highly specialized AEC projects; it takes a lot of living and a lot of know-how to properly handle projects of this nature and magnitude.

Why it was necessary in the first place to build this costly temporary project and not have this cost applied direct to the permanent project is beyond my conception, maybe I haven't lived long enough to know the answer to this one, will have to wait for Messrs. Lilienthal, Wilson, and the Chicago University to come up with the answer to this one.

So let's all watch out against waste and save the taxpayer's money.

I was employed on the temporary project as mechanical engineer in the design from May 1948 until March 1949.

And while on the subject of waste, let's all get behind the Hoover report for elimination of waste and for more efficiency in Government affairs. Only the sheer force of public opinion will bring about the elimination of waste.

Submitted by Louis H. Goeltz, June 4, 1949. 2027 East Marion Street, Milwaukee 11, Wis.

I would like to read from this statement on Schenectady, which is a proposed pile installation. It reads:

1. Construction started August 1, 1947. The following companies are sub-contractors to the Walsh Construction Co., at Knolls Atomic Power Laboratory: Heating, ventilating, air conditioning, Raisler Corp., cost plus fixed fee; electrical work, Fischbach & Moore, Inc., and Watson-Flagg Engineering Co., cost plus fixed fee; plumbing work, Burns Brothers, cost plus fixed fee; steam boilers, Babcock & Wilcox Co., lump-sum; paving and yard work, Weber Construction Co., unit price; painting all buildings, J. I. Hass Co., lump-sum; furnishing and erecting structural steel, American Bridge Co., unit price.

The original estimate of \$26,965,000 was originally intended—

and I am reading from the Commission's own report—

to cover the laboratory and the reactor facilities. The reactor project was in an embryonic stage and the location had not been determined. The final indicated cost for the laboratory closely approaches the original estimate for both laboratory and reactor. The reasons for this are indicated below. After the site for the reactor was selected the General Electric Co. was directed to proceed with the design and the Walsh Construction Co. was given a contract for drainage and site work only. An estimate of cost for the reactor facilities of \$20,912,000 was made but was based on very meager information. General Electric has just prepared a new estimate based on additional progress in design which indicates a substantial increase in this figure. The new estimate has not yet been approved.

That new estimate by General Electric might be reminiscent of the installation that went from 6,000,000 to 25,000,000 at Hanford, Mr. Chairman. To continue:

The increase in final indicated cost is due to the following reasons: (a) Increased labor and material prices; (b) changes in plans because of health reasons resulting in separate buildings for radiochemistry and for metallurgy and physics; (c) one portion of the plant comprising three facilities for separation and disposal was brand new in conception and no criteria existed on which to base reliable costs. It became necessary to provide two buildings costing 5½ million dollars not previously contemplated; (d) no information was available as to the huge amount of air handling equipment required to insure adequate health protection; (e) an extension of 96 by 120 feet was added to one building; (f) a sizable mezzanine was added to one building; (g) an addition to the basement of one building was made; (h) additional buildings and revisions increased cost of sewers, utilities, grading, protective lighting, security and alarm systems; (i) under estimation of various construction costs due to lack of sufficient plans and detailed information such as type and quality of materials and accuracy of control required for various laboratory and research operations; (j) operating criteria (developed after project initiated) resulted in the necessity of another more remote site for the reactor proper.

I do not intend to raise the question in this particular hearing on the Fort Peck and the Arco matters for the reason that there has already been a record made before this committee of hearings, and I do not believe I should duplicate that record here. But I do submit that up until a few days ago, and so far as I know, the final decision on the location of the reactor plant and program and what goes where has not yet been made.

General Electric, through Mr. Winne, testified here 2 or 3 days ago that so far as he knew, the final decision had not been made on the location or the exact type of reactor at Schenectady.

I read these things because those are some of the matters I am considering and also for the consideration of anybody who wants to answer them.

Mr. VOLPE. Mr. Chairman, may we have the report identified?

Senator HICKENLOOPER. This is the pamphlet entitled "Construction Program Data Requested in Hearing on May 16, 1949, by the Chairman of Special Subcommittee in Charge of Independent Office Appropriations, House of Representatives." This is the report that is to be put in that report of hearing.

I would like to ask Mr. Cook one question, if I may, if he is still here.

Mr. Cook, did the AEC spend approximately \$20,000 to have some group come in to make a survey of the rental conditions there some time ago?

Mr. COOK. The firm of Treadwell & Goldstein, real-estate appraisers, were engaged last year to make a survey of our housing and to make recommendations on the correction of inequities in Oak Ridge and recommendations as to increases in rentals at Oak Ridge to conform favorably with the rentals in the surrounding communities.

Senator HICKENLOOPER. That cost was approximately \$20,000?

Mr. COOK. Approximately, yes.

Senator HICKENLOOPER. What other surveys have you had there by outside groups? I believe you had a town management survey, did you not?

Mr. COOK. We have had a survey by the firm of J. L. Jacobs Co.

Senator HICKENLOOPER. Have you surveyed bus operation?

Mr. COOK. We have had a survey of the bus operation.

Senator HICKENLOOPER. How much did that cost?

Mr. COOK. I do not remember the figure on that, sir.

Senator HICKENLOOPER. Can you get that and put it in the record, the entire cost paid for the survey of the bus situation?

Now, did you have a town management survey?

Mr. COOK. Not a town management survey—a real-estate survey.

Senator HICKENLOOPER. Did you have any other survey? Is that the real-estate survey that cost about \$20,000?

Mr. COOK. Yes, sir.

Senator HICKENLOOPER. Did you have any other surveys looking toward the operation of that community down there?

Mr. COOK. We had a survey by the firm of J. L. Jacobs & Co. of Chicago for the sole purpose of determining whether or not it was feasible to incorporate the city of Oak Ridge, and steps that we could go through to arrive at incorporation.

Senator HICKENLOOPER. How much did you pay them?

Mr. COOK. \$26,000.

Senator HICKENLOOPER. Have you had any other surveys? I mean that do not go to the technical end, into such things as fissionable materials or anything of that kind. I am talking about general operations at Oak Ridge.

Mr. COOK. We had a survey by a New York firm, the name of which I cannot recall at the moment, which was a management survey covering the AEC-contractor relationship that was completed sometime last year; and, as a result of that survey, we have made considerable changes in our organization.

Senator HICKENLOOPER. How much did that survey cost?

Mr. COOK. I do not recall that figure, sir. I will have to get it for you.

Senator HICKENLOOPER. Have you had any other surveys?

Mr. COOK. Well; the master plan really was a survey of the community to provide for a long-range development of physical growth.

Senator HICKENLOOPER. Who made that survey?

Mr. COOK. That survey was made by the firm of Skidmore, Owings & Merrill as a part of their work. It was under the direction of a special committee consisting of Mr. Tracy Auger, then of TVA, and Mr. ———; I cannot think of his name right now. He is in the office of the chief of engineers in charge of regional planning.

Senator HICKENLOOPER. How much did that survey cost?

Mr. COOK. I will have to give you those figures.

Senator HICKENLOOPER. Have you had any other surveys?

Mr. COOK. We had a survey conducted by the firm of Skidmore, Owings & Merrill of our commercial facilities.

Senator HICKENLOOPER. How much did that survey cost?

Mr. COOK. I will have to provide that information.

Senator HICKENLOOPER. Did you have any other surveys?

Mr. COOK. We had a firm of accountants engaged by the Commission that performed a Commission-wide survey, as well as Oak Ridge, to review our cost-accounting set-up and install industrial-type, commercial-type cost accounting.

Senator HICKENLOOPER. Was any portion of that paid by the Oak Ridge AEC?

Mr. COOK. No, sir. That was a Commission-wide survey, paid for by the Commission in Washington.

Senator HICKENLOOPER. I would like, Mr. Chairman, if the cost of that complete survey could become part of the record.

The CHAIRMAN. Very well, Mr. Cook.

Mr. COOK. We also have a firm making a complete appraisal of all facilities.

Senator HICKENLOOPER. Is that firm engaged in the making of that appraisal now?

Mr. COOK. That firm is engaged——

Senator HICKENLOOPER. How much does that contract call for?

Mr. COOK. That is a Commission-wide survey, and the contract is handled by the Commission.

Senator HICKENLOOPER. If we can have the full information on that, Mr. Chairman, I think it would be helpful.

The CHAIRMAN. Yes.

Senator HICKENLOOPER. Do you have any other surveys?

Mr. COOK. The only one I think of right now was paid for by the businessmen of Oak Ridge. It was a commercial survey.

Senator HICKENLOOPER. That was without expense to the Commission?

Mr. COOK. That was without expense to the Commission.

Senator HICKENLOOPER. I think that is all.

Mr. WILSON. Mr. Chairman, we would like an opportunity to present a total list on this. Mr. Cook may have overlooked some of this. We would like to submit a total list of what the jobs cost and everything.

Senator HICKENLOOPER. If there is any correction or any detailed exactness that can be put in, it should be put in.

(The data referred to above are marked "Exhibit 25" and will be found in the appendix.)

Senator KNOWLAND. Mr. Chairman, so that we will not leave suspended in midair answers to some of the queries I have raised in prior meetings, I would like to have printed in the record at this point the letter of June 29, by Mr. Lilienthal, addressed to the chairman, relating to some emergency clearances which he sent in; and also the letters of June 24 and June 27, giving the list of AEC employees and contracting employees receiving more than \$14,000 salary.

The CHAIRMAN. Yes.

(The data referred to above are marked "Exhibit 19" and will be found in the appendix.)

Senator KNOWLAND. I also wish the Commission to furnish not the names of the individuals but the number of employees receiving upward of \$10,000 in each bracket. In other words, 50 at \$10,000, 20 at \$11,000—whatever it may be—between \$10,000 and \$14,000. Could that be furnished to the committee?

Mr. WILSON. Figures comparable to the ones we have given?

Senator KNOWLAND. Except here we have the names, but from \$10,000 to \$14,000, the number in each bracket.

Mr. WILSON. Yes, sir.

(The data referred to above are marked "Exhibit 26" and will be found in the appendix.)

Senator KNOWLAND. Then, Mr. Chairman, I would like to ask Mr. Wilson a question with regard to this fellowship program. I understand out of the 497 recipients of Atomic Energy Commission fellowships, 400 have signed the loyalty oath.

That presumably means that 97 as yet have not done so. Could you bring the facts up to date as to whether any additional ones have signed it? If not, whether they have definitely refused to sign it or whether we have just not heard from them. Also the number who have definitely refused to sign, where you have an affirmative act on their part, refusing to sign.

Also furnish to the committee the date when the notifications were sent out and facts as to whether any follow-up letter has been sent out since the original letter, and also information as to whether you have set a deadline by which time you must have heard from them before taking whatever action the Commission or the group will take.

Mr. WILSON. I will be glad to furnish a statement of the current position on that, Senator.

(The data referred to above are marked "Exhibit 27" and will be found in the appendix.)

The CHAIRMAN. Is that all, Senator?

Senator KNOWLAND. Yes.

The CHAIRMAN. Senator Hickenlooper, I knew I had some recollection of an editorial in the Star in relation to cost of high schools. I have had it located.

The cost of the school at Hanford was estimated originally to be \$1,786,000; whereas, the final cost was \$3,980,000, or an increase of 123 percent.

Now, there is a colored high school projected, to be known as the Spingarn High School. When the colored school was authorized back in 1941 it was estimated it could be built for \$1,158,000, but this has had to be steadily revised upward until today the cost is placed at \$3,600,000. That is an increase of 219.9 percent.

Senator HICKENLOOPER. That is from 1941. I do not believe wages and materials were anywhere near in 1941 what they were last year.

The CHAIRMAN. I do not think they are either.

Senator HICKENLOOPER. How many students are anticipated and what is the size of it?

The CHAIRMAN. It does not say. I will get some more data on that.

Are there any other matters?

Senator HICKENLOOPER. Yes. I would like, Mr. Chairman, to examine the traveling itinerary of Mr. Lilienthal, together with any persons who have accompanied him on these trips, where they were trips at Government expense. I would merely like a list of those. I am not interested in his vacation time, I do not mean that or anything of that kind, but where the trips were and those that were at Government expense, where the Government paid the transportation and perhaps a per diem.

The CHAIRMAN. I assume you will be quite willing and ready to furnish that, Mr. Lilienthal.

Mr. LILIENTHAL. Sure. I will put in about my vacations, too, if it is desired.

Senator HICKENLOOPER. I am not talking about vacations. I am talking about official business. Also those who accompanied him on these trips.

The CHAIRMAN. It is now 1 o'clock.

Mr. DURHAM. Mr. Chairman, on a matter of that kind I believe it should be determined by the committee as a whole..

Senator HICKENLOOPER. It is all right if you want to determine it by the committee as a whole. I am perfectly willing. I have only asked for records on official trips and not on any private matters.

The CHAIRMAN. I am sure, Mr. Durham, that Mr. Lilienthal will be more than willing to furnish the information requested by the Senator, and I do not have any doubt but what it will show that he has been traveling around working at this job.

We have a meeting this afternoon at 3:30, at which I will request the Commission to be present. We have a matter to discuss with you which can only be discussed in executive session. It has to do, however, I will say, because we have already told the press—it has to do with the current proposals of the Appropriations Committee to write some legislation into the appropriation act. So if you gentlemen can meet us at 3:30 in room 48-G, we will be very appreciative.

Mr. WILSON. Mr. Chairman, may I inquire whether Senator Hick-

enlooper has finished with the Oak Ridge questions, the questions pertinent in regard to the people from Oak Ridge remaining.

Senator HICKENLOOPER. At the moment; yes. I will go on with some other matters. There may be quite a number of matters that we will want to reopen a little later for some further explanation, but I am anxious to get on. Chiefly, I am anxious at this time to clean these things up and then get on to the question of these security files which the committee has and which I think ought to be examined at the earliest possible moment, because I think they are very vital and very important.

Mr. WILSON. May we inquire as to the subject for tomorrow, Mr. Chairman?

Senator HICKENLOOPER. I will get word to the chairman about that.

The CHAIRMAN. We will call you later in the day, Mr. Wilson.

Mr. VOLPE. Will meetings be scheduled for the rest of the week?

The CHAIRMAN. There is one scheduled for tomorrow morning, an executive meeting scheduled for this afternoon. The committee will recess at this time.

(Whereupon, at 1:05 p. m., the joint committee adjourned, to reconvene at 10:30 a. m., Thursday, June 30, 1949.)

# INVESTIGATION INTO THE UNITED STATES ATOMIC ENERGY PROJECT

---

THURSDAY, JUNE 30, 1949

CONGRESS OF THE UNITED STATES,  
JOINT COMMITTEE ON ATOMIC ENERGY,  
*Washington, D. C.*

The joint committee met, pursuant to adjournment, at 10:40 a. m., in room 357, Senate Office Building, Washington, D. C., Senator Brien McMahon (chairman) presiding.

Present: Senators McMahon (chairman), Vandenberg, and Hickenlooper; Representative Elston.

Also present: David E. Lilienthal, Chairman; Sumner T. Pike, Commissioner; Lewis L. Strauss, Commissioner; Gordon E. Dean, Commissioner; Henry D. Smyth, Commissioner; Carroll L. Wilson, General Manager; Carleton Shugg, Deputy General Manager; Joseph Volpe, Jr., General Counsel; Bennett Boskey and Everett L. Hollis, Office of the General Counsel; Morse Salisbury, Director, and Rodney L. Southwick, Division of Public and Technical Information Service; Lawrence R. Hafstad, Director, and George Weil, Division of Reactor Development; E. R. Trapnell, Deputy Director, Division of Information; Edward Brosman, Division of Security; all of the United States Atomic Energy Commission.

The CHAIRMAN. The committee will come to order.

You may proceed, Senator Hickenlooper.

Senator HICKENLOOPER. Mr. Chairman, I wonder if the information on the payment, reimbursement, or compensation to the Louisville & Nashville Railroad and the Southern Railway is now available. I asked for that information yesterday.

Mr. VOLPE. Mr. Chairman, the information is not available. Mr. Cook returned to Oak Ridge last night and was planning to send it up today.

Senator HICKENLOOPER. The Commission does not have that here in Washington?

Mr. VOLPE. Not in Washington, sir.

(The data referred to above are marked "Exhibit 28" and will be found in the appendix.)

Senator HICKENLOOPER. I also asked yesterday afternoon for a list of all survey boards, advisory boards, together with the amount of money paid for each, beginning January 1, 1947. I asked for that yesterday afternoon through the committee staff from the Commission. Are those figures ready?

Mr. VOLPE. No, sir; they are not. We received the message around 4:30 and immediately circulated to the field the information requested. We are hoping that the information will be in this afternoon.

(The data referred to above are marked "Exhibit 29" and will be found in the appendix.)

Senator HICKENLOOPER. That information is not compiled in one place in the Commission in Washington?

Mr. VOLPE. Not in one place, sir.

Senator HICKENLOOPER. And has to be picked up from the various locations in the field; is that correct?

Mr. VOLPE. That is right, sir.

Senator HICKENLOOPER. I will ask Mr. Lilienthal if he has the list of travel time on official business for which I asked yesterday. Is that prepared yet, or when will it be?

Mr. VOLPE. We tried collecting the information yesterday. It meant going back into diaries, and so on. It is being typed and should be ready this morning.

I might say with respect to these surveys, we have a few in Washington—that is, those which were initiated in Washington—that we assumed that Senator Hickenlooper was interested in the total picture. We could supply the few that originated in Washington. I could get that by telephone.

Senator HICKENLOOPER. I am interested in the total picture. Do you have the surveys initiated in Washington now with you here?

Mr. VOLPE. Not here, sir. It is being collected along with the rest so you could have a complete report.

(The data referred to above are marked "Exhibit 30" and will be found in the appendix.)

Senator HICKENLOOPER. Well, I had hoped to be able to discuss that just a little bit this morning.

I would like at this time, Mr. Chairman, to amplify just a little the report on the Brookhaven matter which I mentioned yesterday and indicate that the original budget proposals for the Brookhaven National Laboratory were \$26,886,500, that there has been obligated to date—that is, the date of June 27, 1949—\$29,962,219, and the present indicated final cost is now \$34,380,335.

In regard to that matter, there is a letter here from Mr. Carroll L. Wilson, general manager, addressed to Senator McMahon, dated June 27, 1949, being signed for Mr. Wilson by Mr. Shugg, together with appendix A, which I would like to have placed in the record at this point, Mr. Chairman.

The CHAIRMAN. Very well.

(The documents referred to are as follows:)

UNITED STATES ATOMIC ENERGY COMMISSION,  
Washington 25, D. C., June 27, 1949.

HON. BRIEN MCMAHON,

*Chairman, Joint Committee on Atomic Energy,  
Congress of the United States.*

DEAR SENATOR MCMAHON: On June 17, Mr. Heller of your staff requested information on the Brookhaven pile complex as to original budget estimate and final cost and also original estimated completion date and presently anticipated operating date.

On June 21, Mr. Heller requested information as to the original estimated cost of the Brookhaven Laboratory, including the pile complex and all buildings for the laboratory. He also requested information on what had been spent to date on the total project and the estimated amount required to complete the presently conceived plan for the laboratory.

On June 20, Mr. McCarthy told Mr. Heller verbally that in April 1948 the estimated cost, for budget purposes of the pile complex (which includes the pile and appurtenant facilities and structures) was placed at \$15,864,000; that the indicated final cost of the pile complex is \$23,322,000; that the estimated completion date contained in the construction contract was February 28, 1949; and that the final completion of the entire pile complex is set at August 29, 1949.

Tabulated below are the facilities which are either completed, under construction, or are planned through fiscal year 1950. Shown also are amounts which have been obligated to date and the indicated final cost on each facility.

*Brookhaven National Laboratory*

	Original budget estimate	Obligated to date	Indicated final cost
Pile complex (1).....	\$15,864,000	\$23,322,000	\$23,322,000
Building modifications, fiscal year 1948 (2).....	1,745,000	1,744,990	1,744,990
Building modifications, fiscal year 1949 (2).....	1,200,000	682,719	1,022,000
Building modifications, fiscal year 1950 (2).....	800,000	0	570,000
Meteorological towers.....	375,000	374,860	374,860
Cyclotron and building (3).....	1,750,000	1,874,580	2,009,000
Cosmotron (4).....	3,475,000	1,937,020	3,795,000
2 mev. Van de Graaff.....	150,000	0	115,000
70 mev. synchrotron.....	300,000	0	250,000
Plant and small-animal farm (5).....	250,000	0	800,000
Life Sciences Laboratory (5).....	600,000	26,050	377,500
Housing for Brookhaven.....	377,500		
Total.....	26,886,500	29,962,219	34,380,350

Appendix A attached contains notes explanatory of the figures given in this letter.

Sincerely yours,

C. SHUGG,  
For CARROLL L. WILSON,  
*General Manager.*

APPENDIX A

(1) It is the ultimate purpose of the Brookhaven National Laboratory to obtain a nuclear reactor offering the maximum in research facilities under the safest possible operating conditions. Both the preliminary design and cost were minimum estimates based on the Oak Ridge pile construction whose limited research facilities do not incorporate the safety features to the same degree as were later introduced into the Brookhaven pile whose power level is many times that of Oak Ridge. No reactor identical to the one being completed at Brookhaven had ever been built.

During the progress of construction the designs were changed to provide for greatly increased size of some of the facilities; additional facilities for research and technical development were added; additional pile material was found to be required; thermal insulation was provided to protect the concrete from excessive temperatures; security fencing and lighting were added; the requirements for instrumentation and controls were greatly increased; and changes were made to provide for expanded experimental facilities. The increased power of the plant, moreover, required more intricate safety systems and controls; a stainless steel stack was designed to prevent contamination of the main pile stack; a waste hold-up system was built and provision made for monitoring effluent liquids.

The first estimated budget figure of \$15,864,000 was based on a preliminary, unofficial estimate made by the H. K. Ferguson Co. in the fall of 1947. The estimate did not anticipate the rapid rise in construction labor and material costs, which according to an Engineering News-Record survey for the period April 1947 to April 1949 increased 23 percent. Neither could it adequately evaluate the productivity of labor or the lack of local skilled labor. It was made without benefit of a comprehensive knowledge of the details which were later developed in the design of the project.

The additional time required to perform the additional work and the changes enumerated above resulted in added cost for engineering, pay rolls, taxes, supplies, rental of office space, and rental of equipment.

At no time during the progress of this work has there been any lack of knowledge as to where the costs were heading. Monthly meetings were held, attended by the top people from the Commission, the laboratory, and the contractor. These meetings discussed costs at length and all concerned have tried to hold them down. The Commission and the laboratory have succeeded in the elimination of many thousands of dollars, the expenditure of which would have resulted in desirable but not essential changes.

(2) The buildings which have been or are being modified consist of about 70 of the 250 original Army buildings. As the functions of the Brookhaven Laboratory increase, more of these buildings are remodeled and put into use for laboratories, offices, and shops. This remodeling is a continuing process adopted to provide space as required and to avoid the expenditure of very much greater amounts of money to construct new buildings. All modification work is done by lump-sum contracts after plans have been prepared, and the cost of each modification depends on the condition of the building and the use to which it is to be put.

(3) The increase in indicated final cost of the Cyclotron of 15 percent over budgeted cost was due to the impossibility of more accurately estimating time and materials before drawings were much further advanced. This project involved new ideas for which there was no background of experience to use as a guide.

(4) The Cosmotron design is now under way and indications are that the original estimate was underestimated by the 10 percent shown as a difference between budget and final indicated cost.

(5) The Plant and Small Animal Farm and the Life Sciences Laboratory are to be combined with an indicated saving of \$50,000.

Senator HICKENLOOPER. Then there is a break-down on existing reactors, with some information about area sites, which has been prepared by the committee staff, which I would like to have put in the record at this point.

The CHAIRMAN. Very well, it is so ordered.

(The information referred to is as follows:)

*Existing reactors.*—The Commission now operates the following reactors:

Hanford: Production reactors.

Oak Ridge: One dual-purpose isotope production and research reactor.

Argonne: Two research reactors.

Los Alamos: Two research reactors.

Brookhaven: One research reactor.

*Reactor sites.*—The Commission now has the following reactor sites which are considered adequate to take care of its needs for the next several years:

DuPage site: Area, 3,733 acres; cost of land acquisition, \$1,987,000. It is estimated that the total cost of this site development will be approximately \$60,000,000. (This includes research laboratories, but not reactors.)

West Milton site: Area, 4,500 acres; cost of land acquisition, \$535,000. It is estimated that the total cost of developing this site and constructing the reactor will be approximately \$21,000,000.

Arco site: Area, 400,000 acres; cost of land acquisition, 200,000 acre Navy proving ground, \$2,600,000; 200,000 additional acres, \$1,400,000. It is estimated that the cost of developing this site and installing all necessary utilities but not including any pile construction will be approximately \$36,000,000.

#### *Reactors now planned for construction*

	Proposed location	Estimated cost
Fast reactor.....	DuPage or Arco.....	\$2,650,000
Navy thermal reactor.....	Arco.....	21,000,000
Knolls intermediate reactor.....	West Milton or Arco..	25,000,000
Materials-testing reactor.....	.....do.....	

The reactors are designed for the following purposes: Fast reactor—to explore the possibilities of breeding; Navy thermal reactor—as a prototype for submarine propulsion; materials testing reactor—to provide a testing facility for various materials to be used in reactor construction; Knolls intermediate—to explore the possibilities of breeding and to develop usable power.

*Reactor Division budget*

	Fiscal year 1948	Fiscal year 1949	Fiscal year 1950
Procurement and production .....	\$4,800,000	\$4,900,000	\$5,500,000
Reactor design .....	15,200,000	9,100,000	9,900,000
Applied research and development .....	9,600,000	19,000,000	30,600,000
Reactor construction .....	1,800,000	3,500,000	35,400,000
Construction of research facilities .....	22,700,000	24,500,000	38,600,000
Total .....	54,100,000	61,000,000	120,000,000

Senator HICKENLOOPER. Mr. Chairman, as I said, I had intended to discuss the survey groups and advisory groups this morning, but I will not be able to do that because we do not have those lists here. I would ask that when the full list is compiled that it might be placed in the record following this day's hearing.

Also, I would like the information on Mr. Lilienthal's official trips placed in the record.

I would like to ask Mr. Lilienthal if he recalls at the moment—if he would like to look at his records, that will be all right—but I would like to ask him how many times he has visited Oak Ridge.

Mr. LILIENTHAL. I do not recall. I will supply the information, Senator.

(The data referred to above are marked "Exhibit 30" and will be found in the appendix.)

Senator HICKENLOOPER. How many times have you visited Los Alamos?

Mr. LILIENTHAL. Three times, I believe.

Senator HICKENLOOPER. Can you verify that? You will supply that?

Mr. LILIENTHAL. I will check.

Senator HICKENLOOPER. How many times have you visited Sandia?

Mr. LILIENTHAL. I will supply the information on these.

Senator HICKENLOOPER. Will you supply the information on Oak Ridge, Los Alamos, Sandia, Schenectady, Brookhaven, the Argonne, Monsanto at Dayton, Mallinckrodt at St. Louis, Inyokern, and Hanford?

Mr. LILIENTHAL. It may be relevant to say that several of us in the Commission had plans for a field trip just prior to the beginning of this investigation, but that prevented our getting out into the field.

Senator HICKENLOOPER. Yes. Now, you did not attend any of the tests at Eniwetok?

Mr. LILIENTHAL. No; I did not.

Senator HICKENLOOPER. Mr. Chairman, as I said yesterday, I have a large file of varying degrees of complaints and alleged shortcomings in various places that I expect to turn over to the committee staff for analysis.

I am not going to impose on your time, nor the committee's time, in going into small details, which will take a vast amount of time.

I had expected to discuss these other matters this morning, but I shall turn over this information to the committee staff for their analysis and for such action as the committee cares to take in connection with the break-down and investigation of these other cumulative matters.

Now, I also feel that I cannot proceed further with my end of this matter. I am not ending it, but I cannot proceed further until the joint committee has taken its action in connection with the security files which I wanted to use as the one portion of this investigation, but which are now with the committee.

There are some other phases. For instance, any matters in connection with the international operation of atomic energy, and my personal feeling is that that should be at least first canvassed by the joint committee in executive session.

I also feel that there are certain more or less technical fields in this program that should first be canvassed at least by the joint committee in executive session. I do not feel that I want to take the responsibility of opening up certain of those things in a public hearing without the full advice of the joint committee at first.

So far as I am concerned, I believe that the joint committee's executive-session activity with respect to the security files, with respect to any matters involving the international relationships, and with respect to certain processes should now be gone into. That is from my standpoint.

So, therefore, I shall desist at the moment from any further pursuit of this until the committee has made some decision on some of those important matters.

The CHAIRMAN. I will instruct the staff to immediately begin this work of analyzing the matters that you are going to turn over, Senator.

I think that we had best contemplate some executive hearings in the afternoons next week, as much as we can do, so that we can get through; and perhaps on Tuesday morning the Commission will be ready to proceed with any presentation that they care to make.

I am hopeful that, without in any way restricting you to the point where you feel you could not make your presentation, that you will keep in mind the burdens under which we are laboring in our work in the Senate, and now that we are coming to the closing days, of our desire to conclude this matter as quickly as we can.

As I say, that is not any admonition to be interpreted as cutting you off or limiting you to the point where you could not make your case, but rather, a request that you do all you can to assist us by making it succinct and brief and yet making what you think is a full defense to the charges.

Senator VANDENBERG. Does the chairman speak with authority when he identifies the closing days of this session?

The CHAIRMAN. I think probably the closing will run until about Labor Day.

Mr. LILIENTHAL. Mr. Chairman, as to the Commission's presentation, you will recall that it was we who asked for an investigation and an opportunity to present an accounting of our stewardship. What we will have to say, and what the witnesses will be called for from various parts of the country will be in the nature of an affirmative accounting of our stewardship, and it will not be long.

It will not, however, be a defense. On the contrary.

There is one matter, Mr. Chairman, that troubles me and has troubled us for some days. That is the continued reference—before you close this or even tentatively close this phase of the case—continued reference, and I think I have counted five or six such references, to a large number of complaints. There has been some reading from these complaints in the form of letters.

Speaking for myself—I have not had a chance to consult my colleagues—but speaking for myself, I think this is a very unsatisfactory way to leave an investigation of charges. It seems to me unsatisfactory to read letters from people whose qualifications and, perhaps, whose motivations are not before the committee into a public record and have them spread in the newspapers without any way of evaluating them.

I think it is especially bad to continue to say there is this great stack of complaints, without having them laid before the committee. I would think myself it would be quite unsatisfactory for the kind of investigation that the committee has launched and the spirit in which the chairman and the members have carried it forward to leave this cloud of inference hanging in this fashion.

We would be much happier, although obviously our work is suffering, to have these complaints out here, let us see what they look like, discuss them in public hearings, and find out what it is that is implied in these references to these complaints.

I am fortified in making this suggestion for two reasons: One is that I know something about how easy it is to write a letter of complaint when one does not have to support it. I am not complaining about it, but I think it is important for the public to understand that when you have as big an undertaking as this, people do write complaints. I think perhaps members of this committee are not unaware of how easy that is.

The CHAIRMAN. I have a few people complaining about me.

Mr. LILIENTHAL. To give them the dignity that is implied in the way they have been described seems to me unfortunate. I do not know what the procedure would be, but for my part I would rather continue to work nights and Sundays trying to keep up our work and have this thing over with in the interest of the atomic energy program.

The CHAIRMAN. Do I understand that you make the request—you heard Senator Hickenlooper suggest that he was going to turn these complaints or letters over to the committee for analysis by the staff. Now, do I understand that it is your wish that until we have acted on those that you do not start your presentation?

Mr. LILIENTHAL. No, it is not, Senator. I simply say I think it is unsatisfactory, it occurs to me to be unsatisfactory to leave this hanging over in this indefinite fashion. I would think if there are claims here and they are meritorious or not meritorious, anonymous or they are signed, we should get that out of the way. I do not mean before Tuesday.

The CHAIRMAN. I do not know what is in them. They have been addressed to the Senator personally, and he is now going to turn them over to us and we will probably know in a general way by Tuesday whether they merit looking into or not. But now the Senator has made his request that the committee take action on these things.

I can understand your desire to have this entire thing in the open, and I assure you that just as quickly as we can, we will analyze that and let you know what it is, if it seems to have any weight at all.

Now, in the meantime, if you are requesting a postponement until Tuesday or Wednesday until we get through with that job over the week end, I would be quite willing. On the other hand, I would prefer myself that you go ahead on Tuesday, if you can.

Mr. LILIENTHAL. May I consult my colleagues on that?

Senator HICKENLOOPER. Mr. Chairman, just as a matter of curiosity only, we did not have a meeting on last Monday and I had previously stated that I had an engagement of long standing at which I felt I had to speak; but on last Sunday it was pretty well scattered over the United States that twenty-some scientists were held over the week end and cooled their heels because I had to be gone on last Monday.

Does the chairman know of any twenty-some scientists or any scientists that were discommoded or inconvenienced by no meeting on Monday morning? I have not seen them before the committee, at any rate, and I wonder if the chairman knows of any possible foundation for that rather widespread statement that was made over the country on the air.

The CHAIRMAN. No, I do not know who was here at the time, Senator.

Senator HICKENLOOPER. There were no scientists contemplated for hearing on Monday.

The CHAIRMAN. You were entitled to an adjournment on Monday, and I imagine that the Commission was glad for the adjournment to get some work done. I was myself.

Senator HICKENLOOPER. I wonder if the chairman knows of any substantial number of scientists that were, as the report indicated, standing around here cooling their heels because of the Monday adjournment. I know of none.

The CHAIRMAN. They did not punch any time clock for me. I did not see them.

Senator HICKENLOOPER. I am glad because I have not known of any such thing.

Mr. LILIENTHAL. Senator, the Commissioners have conferred on this matter, and their suggestion and request is that the Commission's presentation begin on Wednesday morning rather than Tuesday. It will be necessary to get in people from various parts of the country; Monday is a holiday and a bad day for travel, and we would be prepared to proceed on Wednesday.

We will follow the suggestion of the chairman, and I am sure the desires of everyone, to make this as succinct and brief and yet comprehensive as possible. It should not take many days.

The CHAIRMAN. Senator Hickenlooper, have you anything further?

Senator HICKENLOOPER. Not at this time. As I say, I feel it is now time, before I proceed any further, that the joint committee decide what it is going to do about a number of these things.

The CHAIRMAN. We will meet, then, at 10:30, as far as the Commission is concerned, on Wednesday morning. I think we will be back in the other room. This was a temporary thing today.

(Whereupon, at 11:06 a. m., the joint committee adjourned, to reconvene at 10:30 a. m., Wednesday, July 6, 1949.)

# INVESTIGATION INTO THE UNITED STATES ATOMIC ENERGY PROJECT

---

WEDNESDAY, JULY 6, 1949

CONGRESS OF THE UNITED STATES,  
JOINT COMMITTEE ON ATOMIC ENERGY,  
*Washington, D. C.*

The joint committee met, pursuant to adjournment, at 10:40 a. m., in the Caucus Room, Senate Office Building, Washington, D. C., Senator Brien McMahon (chairman) presiding.

Present: Senators McMahon (chairman), Vandenberg, Millikin, Knowland, and Hickenlooper, and Representative Jackson.

Also present: Senator Russell B. Long.

David E. Lilienthal, Chairman; Sumner T. Pike, Commissioner; Lewis L. Strauss, Commissioner; Gordon E. Dean, Commissioner; Henry D. Smyth, Commissioner; Carroll L. Wilson, General Manager; Carleton Shugg, Deputy General Manager; Frances Henderson, Assistant to the Chairman; Joseph Volpe, Jr., General Counsel; Bennett Boskey and Everett L. Hollis, Office of the General Counsel; Morse Salisbury, Director, and Rodney L. Southwick, Division of Public and Technical Information Service, all of the United States Atomic Energy Commission.

Robert F. Bacher (former Commissioner, AEC), chairman of the division of physics, mathematics and astronomy, California Institute of Technology.

The CHAIRMAN. The meeting will come to order.

Now, this is the first meeting that the committee is having for the purpose of hearing from the Commission on their stewardship of the Atomic Energy Commission.

Who will be the first witness for the Commission?

## STATEMENT OF DAVID E. LILIENTHAL, CHAIRMAN, ACCOMPANIED BY JOSEPH VOLPE, JR., GENERAL COUNSEL, UNITED STATES ATOMIC ENERGY COMMISSION

Mr. LILIENTHAL. Mr. Chairman and members of the committee, the principal witness this morning will be a member of the original Commission, Dr. Robert Bacher, who, on May 10, resigned his position and has returned to teaching, to the teaching profession from which he came originally.

The purpose of my statement this morning, preceding this, will not be to testify on substantive matters but to seek to develop in 15 minutes or so a setting for the witnesses who will follow. These witnesses will be relatively few in number so far as the Commission's volition is

concerned. They will endeavor to be as brief and succinct as is consistent with the subjects on which they will testify, because of the committee's desire not to have these hearings longer than is necessary.

We believe, these witnesses, beginning with Dr. Bacher, will provide the country with a report and a perspective by which to judge the grave charges of "unbelievably bad management" that have been leveled against the Commission and against its Chairman.

What I shall discuss this morning is by way of perspective and the testimony of these witnesses can be summarized in this way, in respect to this question: About what is it relevant for the witnesses to be testifying at this juncture in the proceedings?

It has been so many weeks ago since these hearings began that it seems to me useful to recall how we happen to be here.

On a Sunday evening, the 22d of May, Senator Hickenlooper, the ranking minority member of the joint committee and its former chairman, issued a statement which concluded by requesting, by suggesting, that the President should call for the resignation of the Chairman of the Commission.

In that statement were very extreme and strong remarks. One of them was that "the Atomic Energy Commission is now staggering under daily disclosures of evidence of incredible mismanagement."

Another was that—

In my opinion—

quoting from the Senator's statement—

there is now perhaps even more serious evidence of maladministration. Our atomic program—

he said—

is suffering from equivocation, misplaced emphasis, and waste.

And he concluded—

It is my considered opinion in the light of the record of the past 2 years that the interests of the Nation can best be served by the President's requesting the resignation of Mr. Lillenthal.

Some days later, Senator Hickenlooper made a further statement or series of statements, one which on May 28, contains these sentences:

I have made these charges on my own responsibility. I am prepared to produce proof. I will go before the joint committee on Tuesday of next week and request that Mr. Lillenthal be called before the committee in public hearings beginning Wednesday morning, so that I may confront him with my evidence.

These were later elaborated in a statement in which this sentence was used:

I was in very intimate touch with the unfolding and development of these programs which, in my opinion, became cumulatively worse, until I feel that now is the time when drastic changes must be made or the consequences will be much worse yet.

Now, it is well to remind ourselves—because in the intervening weeks matters that, perhaps, are not in themselves of the greatest import have been discussed, that these charges were of the gravest possible character, and they were so regarded by the country.

I think it is quite difficult for the Commission to present its affirmative accounting or stewardship unless that fact is constantly borne in mind. Nothing that has happened since these charges were made have made them any less grave.

It was said by some in editorial comments, to indicate how gravely these charges were regarded, that my conduct was "bordering on treason." There were others that indicated that the Chairman of the Commission should be impeached.

There were more extreme comments than these in responsible quarters which indicated how clearly grave and serious these charges were.

I quote from only one, and that is an editorial in the highly respected Washington Star on May 27, 1949:

The charges—the gravest of them accusing the AEC of "incredible mismanagement"—have left the impression in many minds that Mr. Lillienthal has been making a mess of the atomic project, and that maybe the security of the Nation has been grievously affected. As yet, however, none of this has been convincingly substantiated; the true facts—whatever they may be—have been obscured by a kind of emotional mist creating doubts and suspicions which actually may be wholly unjustified.

Our atomic project, after all, is a thing of overshadowing importance to the safety of our own and like-minded nations in this period of dangerous international tension. If it has been subjected to "incredible mismanagement," that fact had better be established now and corrective action taken before it is too late. On the other hand, if it has been well managed, charges to the contrary ought to be specifically dismissed, not merely to vindicate Mr. Lillienthal, but to put an end to the unwarranted uneasiness among Americans and to make clear to other countries—including Russia—that we are not falling down on the job in any degree.

On the 25th of May, I transmitted to the chairman of this committee a letter which is in the record, a few passages from which I believe should be read as a preliminary to the series of witnesses whom we requested to appear before this committee.

The letter begins:

DEAR SENATOR McMAHON: A full, complete, and speedy report on the charges that the United States atomic energy program is virtually a failure is a matter urgently necessary; the investigation initiated by the McMahon committee and to be carried out by it is welcomed.

The charges by Senator Hickenlooper of "incredible mismanagement," "misplaced emphasis," and "maladministration" involve nothing less than the security of this Nation and the peace of the world. If it is true that the atomic energy program is in an almost bankrupt condition then this country—this Nation—far from being the custodian and the trustees of a substantial stock pile of atomic weapons and in a favorable production situation, is in a sadly weakened condition. If this were true, it is difficult to imagine any single fact more disturbing to the peace of mind of the people of the country or to the security of the world's democracies.

Then, it continues:

But the chief question, I believe, is this: Is this country weak today in atomic weapons and materials, and in their production and improvements as implied by the broad and grave charges leveled against the Commission?

And the final paragraph:

In order that the fears and misapprehensions on this score may be settled beyond peradventure and as promptly as it is possible, it is urged that the joint committee call before it immediately not only the Commission, its staff, its principal industrial and university contractors, but also citizens of the highest renown and technical standing, including the distinguished members of the General Advisory Committee and other advisory groups for their testimony and appraisal. In this way, the dangerous cloud of uneasiness resulting from these charges will be dispelled.

The testimony of the witnesses we are suggesting appear before you, Senators, will relate chiefly to an accounting of the stewardship of what we regard, rightly or wrongly, as the most vital areas, that is

to say, they will testify as to what have been the results of the last 2½ years.

The question has been raised as to whether these over-all results are relevant to the charges of "incredible mismanagement."

I should like to present the Commission's views on this matter at the outset. I gather from things that Senator Hickenlooper has said in the course of the hearings that he has doubts as to whether they are relevant.

On May 26, in the course of a statement the Senator made, quoting from him:

From the standpoint of actual production the atomic energy program has gone forward due to the zeal and the loyalty of the scientific and technical personnel in charge of the various projects. The point of my objection—it continues—

is not to the activities of these people, but to the administrative policies which the Commission, under Mr. Lilienthal's guidance and influence, has followed and continues to follow. These, I believe to be harmful and not in the best interests of a continuing development of the basic programs outlined by the Congress.

It seems to us that one can hardly say that one is not interested in or regards as irrelevant whether the results, the important results are good, where the charge is maladministration of a project.

There is a lot of ancient wisdom, Mr. Chairman, behind the idea that one judges by results.

In the teachings of Jesus in the Gospel, according to St. Matthew, chapter 7, verses 16 through 20—one of the great statements to this effect is as follows:

Ye shall know them by their fruits. Do men gather grapes of thorns or figs of thistles?

Even so every good tree bringeth forth good fruit; but a corrupt tree bringeth forth evil fruit.

A good tree cannot bring forth evil fruit, neither can a corrupt tree bring forth good fruit.

Every tree that bringeth not forth good fruit is hewn down and cast into the fire. Wherefore, by their fruits ye shall know them.

It is the theme of our presentation that very bad management can hardly produce over-all good results.

Now, how can these over-all results and the quality of management reflected in them be presented without injury to security? We touched on this in the opening session of these hearings. We suggested that one of the ways is by the appraisal of outstanding men, and I should like to indicate a partial list of the men whom we hope the committee will hear. They begin with our former colleague, Dr. Robert Bacher, who is now the chairman of the division of physics, mathematics and astronomy at California Institute of Technology; Mr. James W. Parker, the president and general manager of the Detroit Edison Co., and chairman of the Commission's Interim Committee on Cooperation of Industry; Mr. Isaac Harter, chairman of the board of the Babcock & Wilcox Tube Co., a distinguished industrialist; Dr. Mervin E. Kelly, vice president of the Bell Laboratories; Dr. Norris E. Bradbury, director of the Los Alamos Laboratory; Dr. L. A. DuBridge, the president of California Institute of Technology, who is the chairman of the General Advisory Committee Subcommittee on Basic Research; Dr. Enrico Fermi, Institute for Nuclear Studies of the University of Chicago, and one of the great pioneers in this field.

What is it that the Commission should have been preoccupied with and concentrating upon at the time it began its duties in April of 1947, the time of the confirmation of the Commission, or on January 1, when the Commission formally took over the custody and the responsibility for the Manhattan District? There were thousands of things to do, and there still are. What were the most important things to concentrate on? In an effort to establish a basis for perspective here, it is important to discuss this for the moment.

This matter of what the Commission should be preoccupied with—what the Commission as an organization should be preoccupied with—is something that will occur a good many times in the testimony to follow, and I think it is important that we refresh our recollections about this.

On June 14, 1946, which is somewhat over 3 years ago, 10 months after Hiroshima, Bernard Baruch, in an address that, in my opinion, will live as one of the great state papers of all times, summarized where mankind stood, and because we still stand there, and because this throws a great deal of light on the conclusions of the Commission as to what to concentrate on, upon the many things that might be done, I should like to read a few lines from that memorable statement. It was, of course, the statement of Mr. Baruch, acting in behalf of the United States, to his fellow members of the United Nations Atomic Energy Commission set up to seek an answer to the question of how can we eliminate atomic energy from warfare.

He began by saying:

We are here to make a choice between the quick and the dead.

That is our business.

Behind the black portent of the new atomic age lies a hope which seized upon with faith, can work our salvation. If we fail, then we have damned every man to be the slave of fear.

At the conclusion of his statement——

The CHAIRMAN. We have failed so far, have we not?

Mr. LILIENTHAL. We have indeed.

All of us are consecrated to making an end of gloom and hopelessness. All of us want to stand erect with our faces to the sun, instead of being forced to burrow into the earth, like rats.

The light at the end of the tunnel is dim, but our path seems to grow brighter as we actually begin our journey. We cannot yet light the way to the end.

What Mr. Baruch said in June of 1946 is at least as true today—I would say, even truer today. In a way, it is mankind's way to seek to ignore things that are uncomfortable, but it is certainly, it seems to me, true.

In any case, nearly a year later, in April of 1947, when the Commission began its work, that light, that dim light, at the end of the tunnel, which this distinguished American citizen believed he saw in June of 1946, was so dim as to be no light at all, and it is no light at all today.

Russia, and Russia only, among the great nations of the earth, has been unwilling to take those steps which might make that dim light at the end of the tunnel, which this hopeful man saw in June 1946, somewhat less dim and brighter.

Well now, confronted with this situation which every realistic man would have to recognize, that the dim light at the end of the tunnel had gone out, the light of hope of early international agreement, an early end of fear, what should the United States Atomic

Energy Commission do, having as its paramount objective, as defined by the Congress, the common defense and security of this country, and the promotion of world peace? What should we concentrate on? What should we be preoccupied with? We believe as one man, and the President, our immediate superior, believed that we should let nothing stand in the way of arming this country atomically in such a way as to erect a great deterrent to aggression in the world; that we should establish unquestioned and unmistakable leadership, and in this way thus buy time for reason to prevail.

What did this mean? It meant that production must be drastically stepped up; that from being a nation virtually unarmed atomically, which was our condition at that time, we must become a nation which had a leadership unmistakable and unquestioned. The country had to be told again and again that the monopoly and the knowledge in the making of atomic weapons was one that could not last indefinitely. The country had been told, and correctly, that Russia will in time be able to make an atomic weapon.

The phrase "when Russia gets a bomb" was repeated again and again; but the country had not been told, because at that time it was hazardous to speak out, so weak were we, that numbers and not simply the first atomic weapon are the crucial item in providing a great and impregnable deterrent to aggression; that numbers, that level of production and quality could provide what a dwindling monopoly lost us.

Numbers meant added production; numbers meant a change in the raw-material situation. Numbers meant new facilities; numbers meant research must be stepped up; quality of production meant improvements had to be made in processing, in fissionable-material production, in weapon design, in weapon engineering, and in weapon field testing.

Right or wrong, Mr. Chairman, we concentrated on that, and we refused, as best we could, to be distracted by the thousand and one useful things that in a normal enterprise and under normal conditions one's attention might well have gone to.

We believe that urgency was required then and, I believe, it is required today. We believe that the chances should be taken, that boldness was necessary. We did not believe that the bureaucratic rule "Don't stick your neck out; don't take a chance on making a mistake" had any application to the situation that our beloved country faced.

Well, the witnesses will devote themselves, not so much to charges, because in the course of these hearings we have, with the courtesy of the committee, its members, Senator Hickenlooper, been able from time to time to indicate the answer to most of these charges insofar as the shortness of notice in some cases permitted.

These witnesses will devote themselves to those things which we believe had to be done, and done fast and done hard, and still need to be done fast and to be done hard and desperately. Those things that we believe—to which we believe every moment of time and every ounce of energy should be concentrated.

Whether what has been presented will substantiate the charges as far as they go, is for the country to decide and for the committee to decide. We believe that none of the matters presented measure up to the charges. Nevertheless, whatever cloud has been cast over the

project can and must be removed if it should be removed. A healthy program, Mr. Chairman, requires confidence; it requires boldness and a sense of urgency. These we cannot carry forward under existing circumstances until the committee has reached its conclusion and these hearings have concluded.

We make no claim to perfection. Over 60,000 people, as we are meeting here, all over the country, are engaged in this work. It would be very extraordinary if at this moment some one of them or more of them were not doing something that was careless, something that was stupid, something that was negligent, something that was contrary to his instructions, or just contrary to good sense.

We say there are inadequacies in the atomic energy program, and I have some very strong feelings about what those inadequacies are. They would differ rather sharply with what some of our critics would regard as inadequacies.

We do not seek to escape responsibility for stupidity or the carelessness or the negligence or the perfidy of any of these 60,000 people scattered through the country who are on the work at this hour. But if the charge is that we as a Commission, or your witness, or any one of the 60,000 is not perfect and not always right, judged as of the time or by hindsight, then the answer is "Guilty as charged."

But this is surely not the standard where "incredible mismanagement" is the charge. The legality of the atomic energy program and the security of the United States is the important thing. We believe we have tried hard to make it so. We believe that there has been progress.

Dr. Robert Bacher, you will recall, was one of the original members of the Atomic Energy Commission. His background at Los Alamos is, I think, familiar to the members of this committee and to the country. If it is the wish of the committee, it is Dr. Bacher's wish and that of the Commission that he proceed along the lines indicated by the statement I have just made.

The CHAIRMAN. All right, Mr. Lilienthal.

Mr. LILIENTHAL. Thank you, Mr. Chairman.

#### STATEMENT OF DR. ROBERT FOX BACHER, CHAIRMAN, DIVISION OF PHYSICS, MATHEMATICS, AND ASTRONOMY, CALIFORNIA INSTITUTE OF TECHNOLOGY

The CHAIRMAN. Doctor, it is a pleasure to see you again under any circumstances and you may proceed.

Dr. BACHER. Thank you, Mr. Chairman.

Mr. Chairman and members of the Joint Congressional Committee on Atomic Energy, I hope you will realize that during the past 2 months I have been doing my best to forget everything I did know about classified matters of atomic energy, and I fear that I may not have some of the things at my fingertips that may be necessary for a presentation of what we carried on during the past 2 years under the Atomic Energy Commission.

However, I was a little bit surprised to find, when I made a few notes on this on the plane coming down here yesterday, that there were at least a few things I did remember still about the project.

Unfortunately, I have not followed very carefully the proceedings in these hearings since they were not available to me where I was, and

I hope I may ask your indulgence if I do not show the amount of familiarity with these proceedings which you might otherwise expect.

When the Atomic Energy Commission took responsibility for the atomic energy project in January 1947, our job was largely determined by what we found at that time. We had to adjust what we proceeded to do by what the state of the project was.

Our conclusion was immediately that first things had to come first, and that vigorous action on the production of atomic weapons and their development, and assuring the production of fissionable material had to be our first responsibility.

This continued to be our first responsibility during the period of my membership on the Commission, and I am sure continues today to be the first line of responsibility of all people who are engaged in that work.

When we took over in January 1947, as a representative of the Commission, I went to Los Alamos to make an inventory of what we had. I made a rather complete inventory—this is at the end of December in 1946. This was directed primarily at making an inventory of the vital components of weapons and fissionable material in our stock. This was not something which I or any other members of the Commission took lightly at that time. We took it very seriously.

I spent 2 days as a representative of the Commission going over what we had. I was very deeply shocked to find how few atomic weapons we had at that time. This came as a rather considerable surprise to me in spite of the fact that I had been rather intimately associated with the work of the Los Alamos project—roughly, a year before.

It might be interesting just to tell a word about how we conducted that inventory. I actually went into the vaults where material was kept and selected at random cartons and various containers to be opened. These, I then inspected myself, using suitable counters and other methods to determine to the best of my knowledge and observation that the materials were what they were declared to be.

In addition to that, I was accompanied by Colonel Gee, Dr. Bradbury, and other representatives of the various departments at Los Alamos, whom I questioned on every piece examined as to whether, to the best of their knowledge and belief, the materials were as represented on the inventory cards which we carried with us.

Judging by the consternation which appeared on some of the faces around there, I concluded that this must have been about the first detailed physical inventory that had been made; and I think I can say without any doubt, that this was about as thorough inventory as could be made without actually tearing things completely to pieces.

Our work during the year 1947 was largely determined by what we found at that time.

Our first effort had to be devoted primarily toward changing the weapon position; and before going into that in any detail, with your indulgence, I would like to go back and give a little bit of background as to how the project operated during the war.

The atomic energy project under the Manhattan Engineering District was a very complex organization. The fundamental scientific and technical work was carried on in a number of universities under contract, and in a certain number of special laboratories that were primarily devoted to one phase or another of the work.

As you may recall, there was a large laboratory at the University of Chicago for the study of atomic piles, or nuclear reactors as we call them today. At Columbia University was a large project for studying the diffusion process for separating uranium 235. At the University of California there was a large laboratory devoted to the study of the electromagnetic process for the separation of isotopes.

In addition to this, a great deal of work was carried on in industrial laboratories at the General Electric Co., Westinghouse, Kellogg Corp., and a large number of other companies that participated in the technical developments that were needed for the atomic energy project.

In addition, the industrial contractors carried that technical development into the pilot-plant stage and they carried it on further into the construction of enormous plants to accomplish these ends. This was a tremendous step forward.

In reactors, for example, one had to go from the construction of a small reactor operating at a few watts to reactors operating at enormous power, and the same thing was true in almost every other phase of the work.

The industrial know-how which American industry possessed was a vital part of that transition, and the industries went further in that they set up the plants, put them into operation, and kept them in operation.

Many times, of course, this was augmented by help and advice, consultation from scientists and technical people who had participated in these developments from their earliest stages.

Now, at the end of the war, after the project had been carried through successfully to the development of the atomic bomb and the materials had actually been produced which were necessary, much of this organization that had been built up melted away.

Many of the people who had worked on the project had been obtained on loan from industries, from universities, from other research organizations, and there was a definite commitment that they would go back to their normal pursuits, and this was the basis on which they had been obtained.

Similarly, many industrial contractors had been promised that they would be relieved of responsibility as quickly as possible at the end of the war. It was more or less inevitable then that at the end of the war the atomic energy project would go into a very dramatic decline, and it did.

This is no reflection whatever on the Manhattan Engineering District and on the stewardship under Lt. Gen. Leslie R. Groves. They did a fine job, and it was more or less inevitable that at the end of the war the project would come crashing down, and it did.

During 1946 there was unquestionably a very serious deterioration in the atomic energy project. Los Alamos, for example, suffered a series of calamities of one sort and another which were very discouraging to the personnel there. Many people became disheartened and left, and a few hardy souls elected to stay with the project and fought it through.

Some of the calamities might just be recalled to you mind. In December 1945, the project ran out of water. All the water that was obtained on the Los Alamos project for a period of some months or more was obtained by hauling it in tank trucks.

The CHAIRMAN. At a cost of \$8,000 a day.

Dr. BACHER. I am not quite sure of the cost, Mr. Chairman, but I do know that a good deal of it tasted of kerosene.

Senator HICKENLOOPER. The pipes froze; did they not?

Dr. BACHER. The pipes froze up; water reservoirs ran low; the project very nearly came to a dead standstill, and part of this experience I lived through myself. I came home from a trip to the East to find my family living in a place with no heat. I am sure I did not get any fraction at all of what many of the other people got who stayed there longer.

During the spring of 1946, water was extremely short. I think it is only by the greatest of luck that a serious calamity in fire did not occur during that period. I was not at the project during the early months of 1946, in the summer, but I am told by people who were there that it was pretty grim and people were very greatly disheartened.

You may recall that it was during the same months——

Senator HICKENLOOPER. Do you mind being interrupted, Doctor?

Dr. BACHER. Not at all.

Senator HICKENLOOPER. I was going to say that the fire hazard still exists, except that you have more water.

Dr. BACHER. Senator, I would say that the greatest fire hazard came from the fact that there was not any water with which to fight a fire.

Senator HICKENLOOPER. I mean the buildings are the same type, generally. They have not been replaced.

Dr. BACHER. The buildings have in part been replaced, in sense that there are now at Los Alamos critical buildings which are fire-proof, and in most of the buildings, there exists a sprinkler system which, I believe, is quite an adequate way of fighting a fire provided you have got some water to back it up.

Senator HICKENLOOPER. Well, at least, last September when I was out there, the buildings seemed to be about the same buildings that had been there a year or so before.

Dr. BACHER. The technical buildings are very much the same. It has seemed unwise to interrupt the work too much in this critical period of 1947 and 1948 to get new buildings, when action at the moment was what was needed.

I believe also that the fire hazard in those buildings, while still existent, is very much diminished by the presence of water in sprinkler systems.

During the fall of 1946, after the passage of the McMahon Act and the setting up of a Commission, spirits began to pick up at Los Alamos, and I would like to say just a word or two, if I may, about some of the conditions at some of the other sites.

At Hanford during that period up to the end of 1946, the pile deterioration had become a very serious matter, and our attention had to be focused on ways of getting around the difficulties which, at that time, seemed to be technically insurmountable. This was a serious matter.

There were also many uncertainties at the Hanford Works which came out of the uncertainties about the contractor.

As you may recall, the plant had been built and put into operation by the du Pont company; at the end of the war the du Pont company asked with vigor to be relieved. This gave rise to great uncertain-

ties in the technical personnel, but to a very considerable extent people who had been actively engaged in the project stayed with it through these rocky times, and a great many of them are there today.

At Oak Ridge, the production situation at the end of 1946 was in the process of rather serious adjustment, but I think one can say that it was in considerably better shape than most of the other things on the project.

The laboratory at Oak Ridge, which had served as a pilot plant for the reactor development during the war, had largely passed through the phase for which it had been built, and at the end of the war the reactor was beginning to be used as a research tool and the laboratory was beginning to be set up around that reactor, directed primarily at fundamental experimentation.

Also the reactor was beginning to be used for the production of radio isotopes which have more recently made such an important contribution and played such an important part in various research projects.

I could go on into the recalling of the status of some of the other parts of the project in 1946, but let me just try to summarize a little bit what the status was when we took over on January 1, 1947.

With weapons, the situation was very bad. We did not have anything like as many weapons as I thought we had, and I was very deeply shocked at what I found when I made an inventory of what we really did have.

The CHAIRMAN. Was the inventory correct?

Dr. BACHER. I made the inventory, and to the best of my knowledge, Senator, it was correct.

The CHAIRMAN. Well, I did not refer to that, Doctor. I meant; you were furnished with the inventory files, cards? You went into the vaults?

Dr. BACHER. I found no discrepancies.

The CHAIRMAN. You checked it physically?

Dr. BACHER. I found no discrepancies whatsoever.

The CHAIRMAN. That is what I wanted to find out.

Dr. BACHER. The status of the Los Alamos Laboratory was depressing to me. I had the greatest admiration for the people who were there and who were trying to build a laboratory anew out of what they had, but it was a difficult job and a heartbreaking job.

At Hanford the stories on the estimated life of the piles out there were distressing, and no one at that time knew how these piles could be prolonged in life. I will not go into a numerical estimate of what the life was supposed to be, but it gave me a very deep shock.

Our production of fissionable material at Hanford had been reduced primarily because of this deterioration which had set in. Our technical work at Hanford and elsewhere, too, had been very greatly slowed down at the end of the war.

At Oak Ridge, K-25 production—that is, at the diffusion plant—was good. They were, however, in the middle of a new test to determine new operating conditions for the plant.

At that time, when we took over, the Y-12 electromagnetic plant was still operating, and there had been considerable success in cutting the costs to moderate figures, but it was perfectly clear that more changes were in store for us.

The laboratory at Oak Ridge was being set up as a general-research laboratory, as I indicated before, and also as a training school for

getting more people, particularly from industry, acquainted with the fundamentals of the atomic energy project.

To summarize it in a word, the technical developments during 1946 had slowed not to a stop but were so slow that motion was hard to detect.

Now, just one more word about the technical developments at that time: One other subject that has been very important to us is the subject of reactors. At the end of the war there was a great deal of optimism about how nuclear reactors could be designed and built overnight, and a big power industry was going to come out of this in a great hurry.

The years 1946 and 1947—particularly the former—brought us a great deal of technical information which was in the nature of a surprise. Looking back at this, we probably should have anticipated some of it a little bit more, and, of course, the optimism of one person is never quite the same as the optimism of another, but the fact is that the serious way in which materials would deteriorate in a reactor and the problems that this would cause in designing and building reactors to operate at high power and under conditions of high specific power were greatly underestimated.

These problems were serious, and they had to be overcome, and it set the whole reactor development project back a great deal. This was a disheartening fact at the end of 1946; and at that time it was not even possible to assess completely how serious a matter this would be.

One could only see that there were big problems that had to be tackled and overcome.

This is more or less the background that the Commission had when it came in and assumed control of the atomic energy project on January 1, 1947.

What we did during 1947 and 1948 was largely conditioned by that state of affairs, and that is the reason that I have gone into it in some detail. I am sure I have overlooked a number of points. If this turns out in the course of further discussion, I shall be glad to amplify these previous remarks.

Our first attention had to be directed toward the production of atomic weapons and to the development of new atomic weapons and to the production of fissionable material to go into atomic weapons, and this is what we did.

Furthermore, we felt it our first responsibility to do everything in our power to build the Los Alamos Laboratory as a solid research and development and production center, because on that laboratory everything depended during that period, so we did our best in that direction.

I think I can say without being immodest, since most of the credit goes to the members of that laboratory who went through that period, that success has been very marked. The Los Alamos Laboratory during 1947 went through a change that I could scarcely believe, and I believe today it stands as a very strong development and research laboratory, with a remarkably high morale.

On the production of fissionable material at Hanford, the problems associated with pile deteriorations were attacked vigorously. These were both the technical problems and the problems of replacement reactors in case the technical problems could not be solved.

Both lines were attacked. The technical problems have been rather successfully solved in the course of the past 2 years, and in the meantime, as you know, replacement piles have been under construction, and this has been carried through to a state of completion.

During that same period, we went rather carefully into the subject of how we might get out more fissionable material from a given amount of raw material, since raw material, as you know, is at a premium, and our objective is the production of fissionable material and to get as much fissionable material as we can from a given amount of raw material.

There has been during the past 2 years a very considerable success in these efforts, and we can today get more fissionable material out of a given amount of raw material, and I am confident that the success will be even more marked in the future.

Furthermore, at Hanford during that critical year of 1947 the first steps were made to figure out how the actual production could be raised, and the first steps, the first actual steps in this direction, were made. Of course, the most important thing that occurred at Hanford was probably that the project was transferred from being a temporary project to being set up on a permanent basis. This made a great deal of difference in the morale of the people who are there and in their outlook on their work.

At Oak Ridge during 1947, the operations at Y-12 were considerably reduced. This was in keeping with the higher costs of the electromagnetic process, and the improvements and developments in the diffusion process for the separation of uranium 235.

The operations at the diffusion plant, K-25, during this same period were stepped up, and there has been continued technical improvements which by the end of 1947 had led to increased production, with a decreased number of people carrying on that production.

During that same period, 1947, we frankly did not have very much success in stabilizing the laboratory at Oak Ridge, at X-10. We had a very difficult situation which arose because of changes in personnel, people who had been on loan, and also which had arisen because the contractor wished to be relieved of responsibility for the operation of the plant.

These introduced unsettling conditions in the laboratory, and, I believe, that the laboratory has only recently recovered from some of the shocks which it had received during that period.

Remarkably enough, during 1947, and still during 1948, the laboratory has continued in scientific output to be a major source of fundamental information about atomic fission and various nuclear processes, and has produced a remarkable series of publications in the technical journals which, I think, are a very great credit to the project.

To speak more directly on the subject of research and development and the problems during 1947, our course during this period was guided to a very great extent by the advice which we received from the General Advisory Committee which had been appointed by the President at the beginning of the year.

This committee, as you know, is composed of distinguished scientists and technical people from the universities and industry, and the Commission has relied very much on their advice on general technical questions.

Also during that same period, we set up an ad hoc committee on biology and medicine to give us some advice as to what we ought to do in these subjects.

This committee was under the chairmanship of Dr. Robert Loeb, and it seemed to us advisable to get an outside committee to offer us some advice as to what we ought to do on this subject.

As you gentlemen are, I am sure, aware, during the war only those subjects in biology and medicine which were of the utmost urgency in the manufacturing and technical problems were studied at all. There was a very great shortage of doctors and of all people with research experience in biology and medicine.

At the end of the war we found ourselves in the position of being unable to understand in any great detail the fundamental question of hazards associated with radioactive materials and particularly with the production and handling of fissionable materials.

We did not understand very well the effects of radiation, and there had not been time to do the fundamental work that was necessary in order that such an understanding of these effects could be obtained.

We tried as soon as possible in 1947 to expand the work in biology and medicine so that there might be a better understanding of the effects of radiation, and so that also some of the beneficial effects of atomic energy and its products might be enjoyed by the country at the earliest possible moment.

Subsequently, a permanent advisory committee on biology and medicine was set up, and this committee, composed of distinguished doctors and biologists, meets regularly and offers advice to the Division of Biology and Medicine on its conduct of work in that field.

During this period of 1947, the advances in the research laboratories were very considerable.

At Berkeley, the research laboratory had quickly gone into high gear at the end of the war under the enthusiastic leadership of Dr. Ernest Lawrence, and considerable new work was being carried on, new machines were being developed, and subsequently, rather startling new results have been achieved with these machines.

At the Brookhaven Laboratory on Long Island, the laboratory actually came into being during this period as a going concern, and today, I think, can be numbered among the strong research laboratories of the country.

At the Argonne Laboratory in Chicago the problems of continuation at the end of the war were indeed very serious. The laboratory had been housed to a very considerable extent in buildings that had been loaned to it by the University of Chicago. Its buildings in the country where the reactors were housed were on borrowed land where I believe commitments had been made for evacuation at the end of the war.

But during this period and in spite of the scattered facilities that were available, good reactor work was going on and good fundamental research was going on. Fortunately, the people at the University of Chicago cooperated on a very thoroughgoing basis with the Argonne Laboratory, and there is today, as you know, the closest exchange of ideas and interchange of personnel. Many of the people at the University of Chicago played major roles in the development of this project during the war.

At the Knolls Laboratory at Schenectady most of the work had to be carried on in temporary buildings that were set up during this period, but the project got ahead with reactor design work and there were during this period some significant advances.

One of the big problems that the Commission had during 1947 was the problem of adequate raw material. There was not as much raw material available as we wanted and needed. We had to figure out how to get along with less and get more out of it. We also had to figure out how we could get more raw material.

I believe this constitutes, Mr. Chairman, a summary of what happened during 1947. I would like to go on to amplify that a little bit further with some of the accomplishments during 1948.

Probably the most outstanding accomplishments during 1948 were the advances which were proved in the Eniwetok tests which were carried out in the spring of 1948. The importance of these tests to the atomic energy project, I believe, cannot be overestimated. I believe we learned more about how atomic bombs work and what we might do in further design work from these tests than had ever been learned before.

You may recall that the test at Alamogordo was accompanied by numerous physical measurements which were carried on to find out how the bomb exploded and what it did when it exploded. Subsequent tests at Bikini and, indeed, those bombs which were exploded over Hiroshima and Nagasaki, were accompanied by a minimum of physical measurement.

The purpose of the Bikini tests was military, not technical. The purpose of the Eniwetok tests was to find out how better bombs might be built, and to that end a great many measurements were made. These measurements were, for the most part, very successful. Our conclusions of the results of the development which led to the design of the bombs used at Eniwetok gave us great heart for new future development.

Senator HICKENLOOPER. Doctor, the design of the weapons tested at Eniwetok were really designs that were conceived during Manhattan District days and laid aside for testing later under a little more peaceful atmosphere; is that not right?

Dr. BACHER. No, Senator Hickenlooper, they were not.

Senator HICKENLOOPER. I think there is some dispute on that subject. I would not dispute your word on it, of course, but there is some dispute about the fact that those designs were generally conceived in the Manhattan District but were not used in the war efforts over Japan.

Dr. BACHER. Senator, if by "conceived" you mean that there was a gleam in the eye, then I would be inclined to agree with you. In developing an atomic bomb there is a long distance between the gleam in the eye and the actual design of the weapon.

Senator HICKENLOOPER. I understand that. I meant to go further and say that even some of the mechanical ideas involved in the tests at Eniwetok were actually proposed under the Manhattan District. I am not quarreling between the Manhattan District and the Commission, but just to get the order of things properly set up.

Dr. BACHER. One of the principles incorporated in the Eniwetok tests had been thought of and planned for prior to the end of the war.

Senator HICKENLOOPER. Yes.

Dr. BACHER. But one of the major developments—I would say the major development—that was tested at Eniwetok we would not have dared to do at that time.

Senator HICKENLOOPER. Yes. That is the point. It was the examination into that phase of it which was left for more proper peacetime atmosphere to develop.

Dr. BACHER. I think one can say, Senator, that there just had not been enough research and development work done at the end of the war to lead to the design of weapons of the sort that were shot at Eniwetok; and on this basis I would say that the Eniwetok test was not the test of weapons which had been designed a long time before, but represented the test of weapons which had been designed on the basis of the research and development work which had been carried out at Los Alamos during 1947 primarily.

Senator HICKENLOOPER. Manifestly, we cannot discuss details about those things at the moment. Excuse me, go ahead.

Dr. BACHER. One of the main results of the Eniwetok tests was that it has led us, in the analysis of the results that were obtained from the measurements that were taken, to the design of new weapons which will make considerably better use of fissionable material than any weapons we knew about before.

This point, Senator, is completely new and even contrary to some of the ideas that we had during the war.

Senator HICKENLOOPER. There was even a school of thought during the war in the early days that the thing would not blow up at all.

Dr. BACHER. I believe some people had that idea. I did not share it.

Senator HICKENLOOPER. There were some eminent people who believed that it would not blow up at all, as I understand it. There was a difference of opinion on the matter. I think it is immaterial now.

Dr. BACHER. I believe I can say that during 1948 the status of the Los Alamos Laboratory, with some fluctuations, to be sure, steadily improved, and I believe it is a very great credit to the members of the laboratory that they were able to design weapons, produce them, and carry through the tests at Eniwetok.

On the production front—that is, production of fissionable material at Hanford—there were some major accomplishments leading to the increase in pile life. I had mentioned before that at the end of 1946 we were confronted with the serious problem of pile deterioration. During 1947 and more particularly during 1948 there were some major technical accomplishments at Hanford which gave us more information on the nature and origin of this deterioration and how it might be circumvented.

Other developments at Hanford led to still further increases in the production of fissionable material from a given amount of raw material, and these improvements are still in the course of development and test. But we are beginning to reap the benefits of this technical work.

There were considerable improvements in chemical processing both in the efficiency of the present process which is used and in the development of new processes which we hope can be installed in the

future and which will contribute still further to the conservation of raw material.

A major construction project, as you know, was undertaken at Hanford. In fact, I guess it is probably the largest peacetime construction project that has been undertaken in the country. A replacement pile, which was designed to be ready as quickly as possible for operation, was set up, and this construction has been completed.

The construction of further units, which were diverted to an increase in our production of fissionable material as new technical developments came along, was also undertaken.

We had established as a general Commission policy that we should increase our supply of fissionable material by every means at our disposal within reason. In addition, during 1948 steps were taken to establish metal production facilities at Hanford. The problem of taking the output of a chemical separation processing plant and producing plutonium element is a very difficult one and involves many problems of remote handling because of the toxic qualities of plutonium.

A plant for the production of plutonium metal was started during this period and largely brought to completion on one of the most rush schedules that the Commission undertook to carry out. Part of the need for this plant came because we felt there should be alternative production facilities for this material and part of it came because in the problem of fabrication and refabrication of weapons there was a major drain on production facilities for fabricating metal and new facilities were needed. That was particularly the case after the Eniwetok tests when new designs came along.

At Oak Ridge the diffusion plant at K-25 continued with its production, and during this same period both increased its production and decreased its staff. The continued high efficiency operation of the diffusion plant has been very cheering.

The plant at Y-12 early in that year was thrown completely into stand-by condition and subsequently, as you know, has been put in even more remote stand-by condition. This goes back to the point that the developments of the diffusion process have outstripped the developments in the electromagnetic process.

Whether subsequent scientific and technical developments will lead in this same direction I think no one can guess. But so far the diffusion process has certainly outstripped the electromagnetic process.

On the subject of reactors, during 1948 the main reactor responsibility at the beginning of 1948 was transferred to the Argonne Laboratory. As you know, reactor work was also carried out at the Knolls Laboratory at Schenectady and was also carried out at the Oak Ridge National Laboratory, and some reactor work was carried on at Los Alamos. By and large these four laboratories have been the main centers of new development work.

I mentioned before that we had been greatly disappointed by some of the things that we found, about some of the obstacles, I guess I might say, that we found had to be overcome in the development of new reactors. During 1947 and particularly during 1948 many of these came a little closer to solution, and while all of the answers are by no means clear even today, certainly some of the answers look much closer to being obtained.

The success at the Argonne Laboratory in going ahead with their designs of a fast reactor have been very considerable, and they have

also carried the main responsibility in the development of the materials-testing reactor or high-flux reactor as it has been sometimes called. This reactor, you may recall, was initially designed by the Oak Ridge Laboratory, and they are now cooperating with the Argonne Laboratory in its design for construction.

The Argonne Laboratory is also carrying the main responsibility in the development of a Navy reactor which is being designed for the propulsion of a ship or submarine and which is being carried to completion with the cooperation of the Westinghouse Electric Co., who have recently taken a contract for this work.

The other reactor, which has been under development at the Knolls Laboratory, has been largely carried on by the General Electric Co., though here, too, they have obtained a great deal of information and know-how from the people who have been engaged in this work for a long time at the Argonne Laboratory. The reactor at the Knolls Laboratory is an intermediate reactor designed with two aims in mind: One, the production of usable power and, two, the accomplishment of the breeding principle with which you gentlemen are familiar.

I think I can say that the reactor program has not gone ahead as fast as we had hoped it would. I think there are a great many reasons for this. Certainly, one reason is that it had to take second place during 1947 to the problems of weapon production and development and the problems associated with the immediate production of fissionable material.

Also there were technical problems which had to be solved before design work could go much further. But I believe today we stand on the threshold of a very great development in this field. I am sure that if we—and by “we” I mean the people of the United States—are not timid in going ahead with this work, I believe that major successes will come to us, but timidity and playing things safe simply are not a background for atomic energy development. If we wait until everything is going to be sure in these developments, we will suffer a major setback of the atomic energy program in this country.

Senator HICKENLOOPER. Doctor, may I interrupt again and ask you: Do you believe that we have been timid in the past? In other words, if I may use a phrase, do you believe we have moved with mincing steps?

Dr. BACHER. I believe, Senator, that during the past 2 years we have taken some pretty considerable steps forward. I believe the best example of this comes from the accomplishments of the Eniwetok tests.

Senator HICKENLOOPER. I just used the term “mincing steps” with the hope that it might strike a responsive chord in your memory.

Dr. BACHER. I certainly remember the phrase “mincing steps.” I recall, I believe, using those words in a hearing with the joint congressional committee some months ago, when I said that I hoped we would not move ahead in this development with mincing steps, but strike out in a bold fashion, and I feel that we are on the verge of those strong steps at the present time. A program has been set out for the development of reactors. This was formulated by the Commission in the fall of 1948 and has formed the background of all steps in this direction which have been taken since then.

The CHAIRMAN. Doctor, if it works, what will it mean to the people of the United States?

Dr. BACHER. Mr. Chairman, it is always very difficult to look too far ahead. With the development of the first steam engine, it would not have been possible to envision the railroad system we have today.

But I think one can be sure that a long-range development of nuclear reactors will have a very great effect upon the lives of the people in this country, upon their living standards, upon the location of their houses, and upon the conditions which generally serve as boundaries to their lives.

There are great areas of this country today which are essentially uninhabited because of the absence of power and water. Atomic energy will not solve all of these problems, but it at least does not have some of the limitations to which we have been subject in past years such as proximity to coal or oil.

In connection with the formulation of a reactor program by the Commission in the fall of 1948, we found that some of the bold steps that needed to be taken would require the setting up of a remote site, remote not only from major cities and other installations, but also remote from any other manufacturing installations which were vital to the project itself.

Accordingly, as you know, steps have been taken to set up such a project in southern Idaho near Arco. It is my own belief, as I think I have expressed to you before, that the establishment of such a project so that the development of reactors may go ahead without that extraordinary excess and overweighting caution, which would inevitably govern it were it to be located elsewhere, would be a necessary part of a reactor program.

Two other points on reactors: There has, during the past year, been a considerable amount of success in the early stages of design and critical assembly tests of the reactor at the Knolls Laboratory at Schenectady. These results which have been obtained have made us understand that there were some problems in the operation of intermediate reactors which had not been fully understood before, and a great deal was learned. This will undoubtedly change in some ways the plans for that reactor.

This is the course of a normal development in a new field and should be expected. It has occurred, and I am sure it will occur again in the future.

Senator HICKENLOOPER. In other words, Doctor, there will be no such thing as a static reactor which is the last word. You will always learn things from every new reactor you build.

Dr. BACHER. I would most certainly be disappointed, Senator Hickenlooper, if we did not learn from each reactor that was built and each reactor will contribute to the building of new reactors, and as far as I can see, the horizon on this is a very, very long way ahead.

Senator HICKENLOOPER. So that there is no such thing as building a reactor and saying, "This is the final word." One has to take a step and build a reactor that encompasses all of the lessons that have been learned at some time and then go forward from there. Is that about the program that has to be followed?

Dr. BACHER. Well, perhaps, I might say it this way, Senator: If you build a reactor then, within the bounds of what you can get into that reactor, you try to incorporate all of the technical advances of the past. If you are building an intermediate reactor, you can incorporate only

part of the advances that have been obtained in the building and operation of a reactor which is greatly different from that.

Senator HICKENLOOPER. But the point is that we do not build reactors and keep saying, "Well, we will study a little more and next year we will learn more," and next year we say, "We won't build a reactor this year because next year we will know more." We would never get any reactors built.

Dr. BACHER. I believe one could only agree with that, Senator.

Senator HICKENLOOPER. That is the point. There must be a point where design is frozen and construction begins and then learn from there for future activities.

Dr. BACHER. There is always a question of balance involved and it is my own conviction that in development of reactors a certain amount of boldness is needed. We must go ahead with the design and the construction of reactors at a time which is long before all of the problems are understood. If we do not do this, we will most certainly lose out in the development of atomic energy.

Senator HICKENLOOPER. I think I agree with that, and I may say also that, as you already well know, I am not at all qualified to discuss reactors with you. I am not a scientist. I am clear out of my element on those things.

Dr. BACHER. I enjoy discussing reactors with you very much, Senator.

Senator HICKENLOOPER. I think it would give you a great deal of pleasure if I undertook to discuss them with you. My ignorance would immediately become apparent.

Dr. BACHER. At Los Alamos during this past year a fast reactor, which was designed at the end of the war, has been constructed and put into operation, and more recently has been operated at the power for which it was designed.

I have been very much interested to learn of the success of that operation, particularly at the designed power, and feel confident that there will be very much scientific and technical information learned from that reactor which will be of benefit to the reactor program as a whole.

It should, of course, be clearly understood that this reactor is a relatively small reactor compared to those which are needed for preliminary units for high-powered reactors, but it is the first operating fast neutron reactor.

Senator HICKENLOOPER. The fuel of that reactor varies somewhat, does it not, from the normal fuel heretofore used in reactors?

Dr. BACHER. This is the first reactor which has been designed to operate with plutonium as a fuel.

Senator HICKENLOOPER. That is what I meant.

Dr. BACHER. The information, Senator, which can be obtained from that reactor will be applicable to other reactors as well.

Senator HICKENLOOPER. I think I saw it shortly after it started up. They were just beginning to get some data out of it.

Dr. BACHER. At the Brookhaven Laboratory, there has been under construction during 1948 a reactor for research use of that laboratory. This reactor is generally modeled on the reactor which is located at Oak Ridge, although it incorporates a number of advances and improvements and will operate at somewhat higher power. We believe

that this reactor, when in operation, will be a major research tool and will provide for that laboratory facilities for research in nuclear physics and neutron physics and general pile technology which will bring to that work many people who would otherwise be working on subjects which are quite unrelated to atomic energy.

I might add that it has been one of the central ideas in the development of the regional laboratories for atomic energy, to provide facilities for the carrying out of more research and for the training of many new people in this field, since I am quite sure that in the days to come the limitation of trained people will be a very serious one.

On the subject of research and development at the end of 1948, I would like to review just a few major accomplishments. At the Berkeley Laboratory where the development of accelerators was undertaken with vigor at the end of the war, they have been successful in completing and putting into operation the big cyclotron, incorporating the frequency modulation principles which were initiated at the end of the war. With this instrument in the spring of 1948, there was the first laboratory production of mesons. These particles which seem to be transitory and with a relatively short life, we believe are intimately related with the origin of the nuclear forces. These are the forces which hold the particles of the atomic nucleus together.

Now, it has been one of the principal ideas in research of the Atomic Energy Commission to promote research and development work aimed at the achievement of a better understanding of the atomic nucleus. It would be impossible for me to come to you and say that I am sure this will lead to the production of better fissionable material or more fissionable material or better weapons or more weapons, but I can assure you, without any qualification at all, that if we are to have a sound atomic energy project, we must have a sound, vigorous, and all-inclusive general research program in the country behind it, lest otherwise we will not be able to make the technical developments which would grow out of these fundamental discoveries.

Senator HICKENLOOPER. This meson business to a layman—is that in the nature of creation of matter, creation of something, rather than splitting or destruction? Is it not sort of putting reverse English on the disruption of matter?

Dr. BACHER. We believe, Senator, that the mesons originate when there is a change of a neutron into a proton, or vice versa.

Senator HICKENLOOPER. I thought that it was the reverse from a fission, more or less the combination of something or in the nature of the creation of something rather than out of these energy forces.

Dr. BACHER. In the sense that mesons appear only when you have a very great concentration of energy, this is most certainly correct, Senator. This is the fundamental reason why in order to study these particles, large and expensive machines are needed in order to accelerate particles to these extremely high energies.

That is the reason why we have been undertaking this sort of work only in a limited number of places.

Senator HICKENLOOPER. What do they call this machine that is bigger than a cyclotron, a bevatron or something?

Dr. BACHER. There are two names for this machine, depending on whether you are an easterner or a westerner.

Senator HICKENLOOPER. I live halfway between.

Dr. BACHER. I do not know what the Iowa term for this machine is. Senator HICKENLOOPER. We do not have them in Iowa.

Dr. BACHER. The same principles which have been incorporated in the frequency modulation cyclotron at Berkeley have been extended into a machine which at Brookhaven has been called a cosmotron and at Berkeley is called a bevatron.

The reason for the Berkeley name, I believe, is that it is hoped that this machine, when constructed, will accelerate particles to several billion electron volts. At the present time the Berkeley cyclotron is the largest machine in actual operation.

One other machine has been constructed at Berkeley, and this is at the present time the largest machine for the acceleration of electrons. The cyclotron, the bevatron, and the cosmotron are primarily of use in accelerating heavy particles—that is, protons, helium nuclei, or other nuclei.

Senator HICKENLOOPER. They will make a stack of pennies stand on edge, I know that.

Dr. BACHER. The synchrotron developed at Berkeley is a machine for the acceleration of electrons, and this machine was successfully operated early in 1948 and has also subsequently been used for the—I beg your pardon. The synchrotron at Berkeley was brought into operation at the end of 1948 or early 1949 and subsequently has been used to produce mesons from the gamma rays or X-rays, which are produced when electrons collide with material after acceleration.

I think these can be said to be major milestones in the subject of nuclear physics and the origin of nuclear forces, which are behind the atomic energy project.

In addition, the Commission has during 1947 and 1948 had a long and vigorous cooperation with the Office of Naval Research in promoting projects in a great many universities. Most universities at the end of the war found that it was quite impossible for them to go into those subjects with the vigor that would be needed in order to have any significant accomplishment if they had to do it entirely with the funds at their disposal.

The Office of Naval Research performed a great service to the country, in my opinion, in helping the universities to get started with this work at the end of the war. The Commission has been cooperating with the Office of Naval Research, and during the past year furnishing, I believe, somewhat more than half of the funds for carrying out the nuclear physics projects which they had undertaken and in undertaking new projects.

In addition, the Commission has undertaken a considerable number of new projects by direct contract. I do not believe that the importance of these projects can be overestimated. They form the foundation stone on which future work will be built. They form the means by which new people will be trained with that information which is necessary for a strong and vigorous atomic energy project.

To sum up where we stand today, I think it is safe to say that today the bomb production is in the best shape ever. Bomb development is now in progress which will make a major improvement in the utilization of fissionable material. This work is based primarily upon the results of the Eniwetok tests.

On the production of fissionable material, the efficiency in the production of U-235 is still increasing, and Y-12, the electromagnetic plant, is no longer in active stand-by condition.

The plutonium production is today increasing and greater than it has been, and we can expect more in this direction in the near future, based on steps that have already been taken.

New facilities for production are now ready. There has been a major accomplishment in prolonging pile life. How far that may go, I do not believe we can hazard a guess today.

In the operation of a reactor you may always have some unforeseen difficulty arise tomorrow. But we have had extraordinary good success so far. We are now producing more plutonium from a given amount of raw material than ever before, and facilities at Hanford are now available for metal production and fabrication.

On raw material, the limited facilities for the production of raw material in this country are now expanding, and I believe that I can say there have been major successes in the technical work which should lead to the utilization of low-grade ores. I believe this is a major accomplishment.

On reactors today, the problems on materials which go into reactors, both the structural materials and the fuel elements, are beginning to be licked. We have learned a great deal about the use of liquid metals in the cooling of reactors.

This is a major step toward the production of power, and I think one can say, without being overoptimistic, that we are getting to the point where we might consider this really feasible. We are beginning to see our way through some of the problems which existed 2 years ago.

There has been a major advance in the fabrication of unusual metals. Fabrication of many of the metals that are needed in reactors has been extremely difficult and has involved metallurgical problems which 4 or 5 years ago were thought to be impossible and which 2 or 3 years ago looked extremely difficult.

The successful operation of the Los Alamos reactor at its designed power is, I think, very heartening. Critical experiments on the model of the Knolls reactor have led to many new results in reactor development. The consummation of a contract with the Westinghouse Co. for carrying out the development of a reactor for the propulsion of a naval vessel in cooperation with the Argonne Laboratory is, I believe, a major step forward, and will, I hope, lead to the early development of a land-based nuclear reactor which could serve as a prototype for a unit actually to be installed in a ship or submarine.

On the general subject of research, I think I could say that the results of the postwar encouragement of research are now beginning to show in a major increase in the output of the scientific laboratories and in the number of competent scientists that are available. The scientific journals are full of important articles reporting work which has been carried out with the help of funds that have been provided by the Commission and materials that have been produced in Commission-operated reactors.

This whole question of research, of course, is a long-term job, and I do not mean to imply in any of the optimistic statements I have made about research that you can expect the ultimate tomorrow, but research must be carried out over a long period of time. Many experiments

will be done which will not lead to results that will be of any help in the project, but occasionally there will be that unusual experiment which will give a surprising result that will just turn the tide in some new development. This is the history of all scientific and technical developments in the past, and I am sure one can rely on this in the future.

I did not mention while discussing the Los Alamos Laboratory some of the significant developments of recent months at the Sandia Laboratory which operates in close cooperation with the Los Alamos Laboratory and also in very close cooperation with the armed forces. This laboratory, as you know, carries on certain development, engineering, and production jobs at the present time.

Recently the Commission has had a thoroughgoing survey made of this work of this laboratory, as well as a survey of the work of the Los Alamos Laboratory.

Based on this report, which was in many respects most flattering to the people at Los Alamos, certain new advances and new plans are being instituted at the Sandia Laboratory. Many of these have been carried on in the time since I have left the Commission, and I am not familiar in detail with them, except that I heartily concur in the report which was prepared and on which these plans are based.

In conclusion, Mr. Chairman, I would like just to emphasize one or two points. I do not believe that you can examine one small fraction of the atomic energy project by itself and hope to come up with any conclusions or answers which are definitive. You must look at the project as a whole. You must look to the results which are obtained.

The project is technically very closely tied together, and the participation by the Commission here in Washington is not just a participation on paper, but it is an actual participation. The decisions which must be made and the plans that must be developed must show an integration of all of the work of the project.

This is true in the development of atomic weapons, it is true in the production of fissionable material, it is true in all the research and development work, and it is most certainly true in the development of nuclear reactors.

Furthermore, I believe that the people who work on the project must have some confidence in the stability of this project. That is what keeps them on the job. It was the uncertainty and instability of the project at the end of the war which sent many people away from the project. We must at all costs avoid that instability and loss of confidence.

Our real strength for the future depends upon progress. Many people say, "Let's lock up the secret of the atomic bomb." Nothing could put the United States in a poorer position in the future. We depend not upon locking things up, but upon new developments and new progress. This is the only way we will get ahead. Speed and competent development we depend upon.

The Commission must be charged with the job of getting ahead as fast as possible with the development of atomic energy and anything that detracts from that speed will endanger this country.

Thank you.

The CHAIRMAN. Senator Hickenlooper?

Senator HICKENLOOPER. I do not have very many questions to ask the doctor, if any. I might have one or two.

I am glad to see you back again. I am always glad to see you back. I am sorry you saw fit to leave.

Dr. BACHER. Thank you. I am glad to be back, Senator.

Senator HICKENLOOPER. I want to assure you, as I have in times past, I have tried to make utterly clear that I feel the scientific people who are engaged in this process, this whole program, have done a tremendously fine and integrated job. I believe their integrity has been high and within the limitations of the tools and the programs that they have to work with; I think they have done a reliable job for the country and for the whole atomic energy set-up.

I, therefore, have no particular questions. I would like to ask you just this question, or these three.

Are you satisfied with our progress in the waste-recovery end of this program?

Dr. BACHER. The atomic energy project in general, Senator, is not one to be satisfied with ever, regardless of what the accomplishments are, because satisfaction indicates that you cannot pour on more oil, and I think we ought always to be pouring on more oil.

Senator HICKENLOOPER. I am just wondering if you are satisfied with the progress we have made on the waste-recovery end of this matter.

Dr. BACHER. I think in any phase of the project, waste recovery included, Senator, we could always do better.

Senator HICKENLOOPER. Are you satisfied with the progress we have made on the chemical separation processes?

Dr. BACHER. I think I would give the same answer to that.

Senator HICKENLOOPER. I shan't try to press that further. What I am interested in, Doctor—and I think you are, too—is to keep our atomic energy program generally as far out in front as possible with its most efficient operation. That goes into general over-all policies as well as operational policies outside of the scientific and technical developments.

Scientific and technical development, I think, has gone forward, after the hiatus that occurred after the dropping of the bomb on Hiroshima, which I believe is a natural let-down because of the uncertainty and because of the quarrels between those who advocated military control of atomic energy and those who advocated civilian control; I think there was a period when no one knew what the future of this program would be and I think a great many people, scientists and technicians and others, went back to their normal work. There was a disruption during that period of time which was probably quite normal after the development of this bomb for the purpose of winning a war.

Therefore, I would not be technically able to dispute you on technical ends of this thing, and I am perfectly willing to agree that the progress has been made on the scientific and the technical end.

I have in mind that when we talk about the Manhattan District and the Commission, a great many of you composed the Manhattan District. You were part of the Manhattan District. Dr. Bradbury was part of the Manhattan District. Dr. Lawrence was a part of the Manhattan District. A great many other famous scientists and technicians were the Manhattan District, who did this job. I think they are still carrying on at a very high level of integrity and a very high level of accomplishment.

That is all I have.

The CHAIRMAN. Mr. Jackson?

Dr. BACHER. Mr. Chairman, might I add just a word to this point? I have a very great respect for many of the people with whom I worked during the war. Many of the people who are in responsible positions now for the Atomic Energy Commission in the technical work were colleagues of mine during the war. There was Dr. Bradbury, Dr. Zinn, and Dr. Haworth at the Brookhaven Laboratory, as well as many others; and I think they deserve a great deal of credit.

Senator HICKENLOOPER. My omission of names did not mean I did not want to credit a great many other people with these accomplishments.

Dr. BACHER. There are many of them who deserve a great deal of credit for this.

I think, Senator Hickenlooper, that it is not possible to draw a sharp line between the technical developments of the project and other developments of the project or between the planning of some of these developments that I have just been discussing this morning and other questions of management. It is my belief that these are the questions of management which are most vital and that other decisions are made so that these may go ahead with the utmost speed.

Senator HICKENLOOPER. My interest is that the other decisions of management, outside of the scientific and technical—that the other decisions of management involved are such that the scientific and technical can go ahead with the greatest possible efficiency and the greatest possible progress.

The CHAIRMAN. Mr. Jackson?

Mr. JACKSON. Dr. Bacher, I take it from what has been commented on by Senator Hickenlooper, that the technical management of the Commission has been in good hands. What is your feeling as to the over-all management of the program insofar as it affects the very vital program of atomic weapons, something which the American people are interested in, in view of these hearings that have been held during the past few weeks?

Dr. BACHER. Mr. Jackson, I think one can only judge this project by what is produced and, accordingly, in trying to give some over-all summary of it this morning I have tried to say what I thought the situation was today.

I believe that the decisions of management that have been taken during 1947 and 1948 have led to a very much stronger project today than we had before. A great deal of effort has been put in, and I believe there is a very considerable measure of success. I am not at all ashamed of where we stand today on the production of fissionable material and the production and development of weapons.

The CHAIRMAN. Mr. Jackson has yielded to me, Doctor. You say that we can tell by the results. You also say that you are not ashamed of the final results—namely, the production of fissionable materials and the number of weapons.

It has been heretofore the policy of the committee not to inquire into or to get reports on those two measures of the Commission's work and, of course, that will only be done after full consideration by the committee itself, a decision with which I heartily concur.

I take it that in your opinion if the results were made known to the American people, you would be satisfied to have those results made

known as composing a test, a very definitive and concrete test, of the success of the Commission's activities.

Dr. BACHER. Well, Mr. Chairman, this poses, of course, many problems, because one must evaluate the importance of that information in the defense of our country. I would not propose to set myself up as a judge of the importance of it.

The CHAIRMAN. I am not talking about the wisdom of doing it or not doing it, Doctor. I am pointing out my belief that if that information could be known, it would be the best test of all as to the success of the Commission in its primary work for the last two and a half years.

Dr. BACHER. I think, Mr. Chairman, that in order to make that single piece of information carry the amount of knowledge to the people of the United States that it should, they would need to know considerably more about what the effects of a given bomb would be, how the bomb was constructed, what went into it, what it might do, how it would be used, and, indeed, a whole lot of things about the fundamentals of atomic energy, so that this might be evaluated against some background.

Let me give an example. I have read from time to time in the press about how it is advocated by one person or another that material be devoted to the development of reactors and production of power and not to the production of weapons. I do not believe that anyone can offer a sensible comment on that unless he knows how much material goes into a bomb, how much material there is, and how much material might be used in a reactor. If you knew these simple things, one might be able to give an evaluation of it.

I am afraid that on these subjects we have, by reason of the security which is imposed on the project, a great deal of misunderstanding and, therefore, a great deal of misinformation is put out, and this gives rise to the jitters and hysteria which we find on all sides at this time.

The CHAIRMAN. Thank you.

Mr. JACKSON. Doctor, would you say that the scientific portion of the atomic energy program is the heart of it?

Dr. BACHER. I would most certainly say that the scientific and technical development work is the heart of the program, and all future progress will depend on these developments.

Mr. JACKSON. In other words, the security of our country, so far as atomic weapons are concerned, does not rest alone with the weapons that we have today but with the possibility of exploiting the best brains and scientific know-how that this Nation possesses?

Dr. BACHER. You are most certainly correct, Mr. JACKSON.

Mr. JACKSON. If the scientific know-how that is available is in good hands, I assume the only other danger would be the question of dissemination of the knowledge we now have and the knowledge that we acquire from time to time in the field of science, if that dissemination is not properly managed.

Do you feel that proper steps have been taken in the field of security, consistent with the over-all aim of providing adequate protection to this country in developing new weapons and the new devices that must be constantly developed if we are going to be secure?

Senator HICKENLOOPER. Mr. Chairman, I have no hesitancy whatsoever in discussing the security program of this Commission, but I call

your attention to the fact that I was stopped on discussing security methods, and if we are going into security and having opinions of various people, then I certainly would like to open up the security question, because I think it is unfair to Dr. Bacher to ask him to give an opinion on security when I will not be able to confront him with various instances and various situations.

I am perfectly willing to go into it, but if we go into it, let us take the whole ball of wax and look at it. I am in no position to cross-examine Dr. Bacher on this thing as to his opinion, one way or the other, and I feel as long as this security matter has been taken away from me and the committee now has it, that until the committee decides what it wants to do with it, that is a field which in fairness cannot be discussed on one side alone, as a matter of pure opinion of a witness.

Mr. JACKSON. Mr. Chairman, my understanding was that as far as security is concerned, the question of individual cases has been held in abeyance or at least the committee has taken action suggesting that those matters be handled in executive session.

But I do think that in view of the discussion that has taken place for at least a couple of days here and possibly more than that on the broad subject of security, that it would be in line for the witness to make a general comment on the over-all situation regarding security.

The CHAIRMAN. Do you, Senator Hickenlooper, believe that the security is barred from discussion by the fact that individual cases have been withdrawn for action in executive session?

Senator HICKENLOOPER. I most certainly do.

The CHAIRMAN. As I understand it, your charges on security rest in the main part upon the individual cases of some individuals who were in the project. As I understand Mr. Jackson's question, he is asking a general question as to whether he believes that the security aspects of the program have been properly attended to. Am I right?

Mr. JACKSON. That is right. Over-all.

Senator HICKENLOOPER. Then I will just say that if the chairman permits Dr. Bacher to answer that question, I expect to ask Dr. Bacher about a great number of individual cases and about individual situations and see whether he approves. I just feel that this whole security situation as it now stands is one that has to be resolved so that we know what we can talk about in public hearing and what we cannot.

I have been staying completely away from that out of respect for the joint committee's authority in these hearing until it decides what it wants to do about them. I do not have any hesitancy about discussing security at all, except that I would not be content to have Dr. Bacher give just a general opinion here without going through a great many things with him, and I feel in the rather nebulous situation that security is in at this time it might even be unfair to him in his answer, it might be unfair to the committee in its final determination.

The CHAIRMAN. In other words, Senator, your contention is that you would be restricted in the scope of your cross-examination, assuming that Dr. Bacher would say that the security of the project has been given proper attention, that you then feel you should be allowed the fullest scope of cross-examination on individual cases.

Senator HICKENLOOPER. The whole field of security, I believe, if that is the case. In other words, I have attempted to stay completely away from the security end of this thing as a matter of discussion or opinion since the action was taken on certain security files, and I have been holding that in abeyance until the joint committee has had an opportunity to determine its own policy on that matter.

Mr. JACKSON. Mr. Chairman, I am not going to press the question now. I just thought that in view of opportunity that was given to the Senator sometime ago in which even one case was discussed at considerable length, that a general statement might be in order, but I am not going to press it at this time.

The CHAIRMAN. I presume that if you do not press it, there is no occasion for me to rule on admissibility of the question. If Senator Hickenlooper believes that that particular question should of necessity give him a right to open him up for cross-examination on these individual cases, it would result in defeating the will of the joint committee as it was expressed in a session that it had about 3 weeks ago. So if you do not press the question, we are not faced with the problem.

Dr. BACHER. Mr. Chairman, I have just one small remark.

The CHAIRMAN. Make it small now, Doctor.

Dr. BACHER. I was reading awhile ago the hearings on the confirmation of Dr. Smyth, and I find, unless my memory serves me wrong, Senator Hickenlooper agreed at that time that on the over-all question of security a pretty good job had been done, but this is not my opinion. I am only quoting his. I am giving no opinion.

Mr. JACKSON. Doctor, how much of an investment was involved in the reactor problem at Hanford as it affected the very serious problem you had of deterioration awhile back? How much money was involved if you had to bring about a replacement?

Dr. BACHER. Mr. Jackson, I think those figures ought to be furnished to you separately, since I do not recall them accurately at the moment, and I do not want to give you something that is misinformation. But I will see that the Commission furnishes it.

Mr. JACKSON. Roughly was it \$10,000,000 or \$50,000,000?

Dr. BACHER. It was more nearly on the order of a hundred million or more. As a result of new developments it has been possible to defer indefinitely over \$150,000,000 worth of Hanford construction that was considered essential in 1947 to keep the production program going and to meet the new goals.

Mr. JACKSON. And as a result of the work that the Commission had been engaged in, it found it not necessary to replace the reactors?

Dr. BACHER. The plan is not to let that work go but to utilize the facilities which have been built to increase the production of plutonium and, in fact, when the reactors were planned, this idea was already incorporated in selecting their location.

Mr. JACKSON. Doctor, you worked with some of the British and Canadian scientists during the war?

Dr. BACHER. I did.

Mr. JACKSON. I wonder if you would be good enough to comment on our policy in connection with the British and the Canadians very briefly and whether you think it has been properly handled.

Dr. BACHER. Just to make a few remarks on this, Mr. Jackson, the cooperation with the British and Canadians during the war was quite complete. It did not cover all parts of the project, but many parts of the project it covered with considerable thoroughness.

For example, with reference to the heart of the project, the laboratory at Los Alamos, the first discussions with the British were undertaken, if I recall correctly, in August of 1943. Subsequently, a sizable British mission came to Los Alamos, headed by Sir James Chadwick and composed of a number of eminent British scientists.

These men worked in many parts of the project. Several of them were in the Theoretical Division there and contributed ideas to the development of the bomb which were very important. As members of the Theoretical Division, of course, they had quite general access to work that was going on in the rest of the project and they had access to the work in experimental physics, in experimental chemistry, to the general metallurgical work that was going on there, to the ordinance development work, and to the bomb physics work. In fact, they had general access to all of the information that was developed at Los Alamos.

Many of them were in these various sections of the laboratory at Los Alamos and participated in that work. One of them was a very close associate of mine in the Bomb Physics Division and was responsible for and participated in many of the critical assemblies of vital materials which were made in the development of the bomb. So they had a thorough and complete knowledge of all the bomb work.

On other parts of the project I cannot speak from quite such close association, but I know that, likewise, they were associated intimately with the development of the electromagnetic process of separation, with the diffusion process in its early days. The Canadians in particular were closely associated with the development of the piles at the metallurgical laboratory at Chicago. The extent of the knowledge which was exchanged during that period of cooperation between the British and Canadians with the United States was very deep.

Mr. JACKSON. What has their participation been since that time?

Dr. BACHER. Their participation in 1946, of course, with the passage of the Atomic Energy Act, was cut to zero; and there has been no participation by them directly in the United States atomic energy project since then. There have, as you know, been established, certain areas of technical cooperation which have been spelled out in considerable detail in papers that have been furnished to the joint congressional committee. There are, I believe, nine areas, some classified, some unclassified.

Mr. JACKSON. Do you feel that their participation assisted materially in the work that you were engaged in at the time at Los Alamos?

Dr. BACHER. There is no question of that, Mr. Jackson.

Mr. JACKSON. As far as the over-all program is concerned, do you feel that every reasonable effort has been made by the Commission to place this country in a superior position as far as atomic weapons are concerned?

Dr. BACHER. That has been the aim of the Commission in everything that it has done. Certainly every decision that the Commission has taken has been toward increasing our position with respect to other nations of the world in the development of atomic energy. I

think, again, that the success can only be judged by what the results are. I believe these results are pretty good.

The CHAIRMAN. As a commission you functioned as five men?

Dr. BACHER. Yes.

The CHAIRMAN. You distribute, I take it, the credit equally among the five?

Dr. BACHER. I think I would like to say just a word about this point, Mr. Chairman, if I may. As a commission, we had a great many meetings. We had many formal questions on which decisions were taken, formal votes. We had a great many informal meetings and we had a great many individual discussions.

I think if there are any questions of management or mismanagement leveled at the Commission or at any member of the Commission, all of the members of that Commission are equally responsible. At least, this is my own view. We participated in all decisions and if these decisions are found to be incorrect, all members are equally responsible.

Now, just a word about how we functioned as a commission.

Mr. Lilienthal, of course, was appointed as Chairman of the Commission and as its head. At the same time, four other members of the Commission were appointed and in general it was our policy to talk over all questions rather much in detail. Inevitably, if you find five people with different backgrounds, they do not have the same opinions on every subject. We rather quickly gained a respect for each other's opinions. I certainly gained a very great respect for my former colleagues and their opinions. When I expressed an opinion and they had some disagreement with it, I took that disagreement seriously because I usually realized that there was something behind that that should be considered very deeply.

Inevitably this meant that in formulation of a Commission policy there would, after discussion, be some view which would emerge. I think this is an inevitable conclusion of the operation of a group of people who have respect for each other's opinions; and it was in this way that most of the Commission's decisions were arrived at.

Now, as you know, there were some points on which we did not have complete unanimity, but I believe it was clear even on these points where there was not complete unanimity of opinion, that there was a thorough-going respect in both directions for the opinions that were expressed.

Mr. JACKSON. I take it from what you have stated here today, Dr. Bacher, that we are making every reasonable effort to do the job that was incumbent upon the Commission during the time you served.

Do you feel that, considering that that has been the objective, it is going to be very easy for any other foreign power to catch up with the United States, considering the productive facilities that we have available and the efforts that are now being made?

Dr. BACHER. How fast other countries will move, Mr. Jackson, depends primarily upon how vigorously they pursue their atomic projects. In some cases we have a rough idea how vigorously their projects are being pursued, and in other cases we have no information at all.

Mr. JACKSON. I think the American people are anxious to know whether we are lagging behind, considering the potential that other

countries might be able to develop and at the same time knowing the great industrial potential that this country has. If those goals are reached by our country each year, do you feel that it will be a very short time or will it be easy for other countries to catch up with the progress that we are normally capable of bringing about?

Dr. BACHER. Let us take a specific example. I think maybe we can do this without getting on too delicate ground.

The British have an atomic energy project. They are setting about the production of fissionable material and have announced that they are developing and intend to produce atomic weapons. I am sure they will be successful in this undertaking. They have all of the technical know-how, all of the scientific background that is necessary for such a development, and I believe it is only a question of time until they do produce bombs.

Now, it is a long step from the production of the first fissionable material to the production of the first atomic weapon. It is another long step from the production of the first atomic weapon to the production of atomic weapons in quantity. It is also another long step from the development of the first reactor to the development of reactors which produce fissionable material in quantity. It is a still further step to the production of reactors which will produce useful power and possibly even breed fissionable material. It is a series of steps, and one must be achieved before the last step can be taken.

Mr. JACKSON. In other words, from what we know now, we are way out in front?

Dr. BACHER. I hope we do not pat ourselves on the back too much for that, Mr. JACKSON.

Mr. JACKSON. I appreciate your feeling about the word "satisfaction," that we should never be satisfied, but I mean, speaking now of facts, what we know of other countries—is it not true that we are way out in front?

Dr. BACHER. I believe there is no question at the present time that the United States is ahead in the development of atomic energy.

Mr. JACKSON. I mean we are not just a little ahead but we are way out in front.

Dr. BACHER. It is my belief we are.

Mr. JACKSON. That is all.

The CHAIRMAN. All right, Doctor. Thank you very much indeed. It is nice to see you again and I hope that future occasions will come about when we can take advantage of your knowledge on this subject.

The Commission has another witness to produce tomorrow morning?

Mr. VOLPE. Mr. Chairman, we have several witnesses that we will produce. There is a little difficulty in travel. Many of these witnesses have to come a long distance and they are very busy men and they have had long-standing engagements. We will have witnesses tomorrow morning. It is a little difficult to say who they will be right now. The names have been mentioned before.

The CHAIRMAN. You do not know what order they will come in?

Mr. VOLPE. That is right.

The CHAIRMAN. We will meet at 10:30 tomorrow morning in this room.

(Whereupon, at 1:22 p. m., the joint committee adjourned, to reconvene at 10:30 a. m., Thursday, July 7, 1949.)

# INVESTIGATION INTO THE UNITED STATES ATOMIC ENERGY PROJECT

THURSDAY, JULY 7, 1949

CONGRESS OF THE UNITED STATES,  
JOINT COMMITTEE ON ATOMIC ENERGY,  
*Washington, D. C.*

The joint committee met, pursuant to adjournment at 10:35 a. m., in the Caucus Room, Senate Office Building, Washington, D. C., Senator Brien McMahon (chairman) presiding.

Present: Senators McMahon (chairman), Millikin, Knowland, and Hickenlooper; Representatives Holifield and Price.

Also present: David E. Lilienthal, Chairman; Sumner T. Pike, Commissioner; Lewis L. Strauss, Commissioner; Gordon E. Dean, Commissioner; Henry D. Smyth, Commissioner; Carroll L. Wilson, General Manager; Walter J. Williams, Director, Division of Production; Gen. James McCormack, Jr., Director, and Capt. James Russell, Deputy Director, Division of Military Application; Frances Henderson, Assistant to the Chairman; Joseph Volpe, Jr., General Counsel; Bennett Boskey and Everett L. Hollis, Office of the General Counsel; Morse Salisbury, Director, and Rodney L. Southwick, Division of Public and Technical Information Service; Charter Heslep, Information and Editorial Specialist; Dr. Norris E. Bradbury, Director of Los Alamos Scientific Laboratory; all of the United States Atomic Energy Commission; Clark Center, General Manager, Carbon & Carbide Chemicals Co., and William Hume, Superintendent, K-25 Operations, Carbon & Carbide Chemicals Co., Oak Ridge, Tenn.; and Mervin J. Kelly, executive vice president, Bell Laboratories, Inc., New York, N. Y.

The CHAIRMAN. The committee will come to order.

Senator KNOWLAND. Mr. Chairman, before we get started with witnesses this morning, there are just two matters I would like to call to the attention of the committee.

Under date of July 7, a letter was addressed to Mr. William L. Borden, Executive Director, Joint Committee on Atomic Energy, signed by Carroll L. Wilson, General Manager, reading as follows:

DEAR MR. BORDEN: At the hearing on June 29, Senator Knowland requested that the Commission supply information relating to the number of holders of AEC fellowships who have not yet completed and returned the non-Communist oath. This request appears at page 1697 of the stenographic transcript. The NRC has furnished us the following information:

The notifications were mailed to all fellows on June 1, 1949.

Out of 497 fellows all but 21 had signed and returned the form of the oath as of Friday, July 1, 1949. Of these 21, 19 had simply not been heard from. Of the remaining two, one has refused to sign and has been notified of the cancellation of his fellowship; one refused to sign and has resigned.

Of the 19 who have not yet returned the form, some appear to have changed their address. In such cases, a new notification has been sent to the professors under whom the fellows are to work.

No follow-up letter was sent by NRC and no deadline for the the signing of the oath was established. It should be pointed out, however, that NRC will grant no payments to a fellow who has not returned the oath.

Sincerely yours,

CARROLL L. WILSON.

Mr. Chairman, I ask that that be made a part of the record so we may have answers to the questions I have raised.

Secondly, on yesterday I received a paper labeled "Memorandum to the file—For general circulation", from W. A. Hamilton, re AEC contractor salaries (reading) :

The memorandum on this subject to Senator Knowland, dated June 28, 1949, should have been classified "Confidential". This information reached this office on July 6, from the Office of Organization and Personnel at the Commission.

It is requested that all outstanding copies of this memorandum be so noted.

It is initialed "WAH", with copies to Senator Knowland, Senator McMahon, and Senator Hickenlooper.

I want to say, Mr. Chairman, that my recollection is that I had put those communications in the record about the day following the time I received them. They should have been printed in the record by this time.

Secondly, I want to raise a point that there is, so far as I can see, no question involving the national security, and this is a type of classification which seems to me to be unwarranted.

The CHAIRMAN. Let me ask you: What is it that was labeled "confidential"?

Senator KNOWLAND. Apparently it was not labeled at the time it was turned over to me on June 28, but on July 6 they discovered that it should have been labeled "Confidential." It is the salaries of those contractors' employees receiving more than \$14,000.

Now, they are being paid out of public funds. I understand the policy of the Commission is that they must have approval of the Commission when salaries of that nature are paid. It seems to me that since this is the public's business, since no matter of national security is involved, it is an unwarranted use of classification to prevent either the committee or the public from having information which I believe should be unclassified.

I would like to ask, Mr. Chairman, that the staff check up and see if the paper or the material was put in the record at the time I requested it. I understand it has been.

(The data referred to above are marked "Exhibit 19" and will be found in the appendix.)

The CHAIRMAN. As I understand it, Senator, these are merely salaries that are paid to contractors' employees.

Senator KNOWLAND. That is right, of more than \$14,000.

The CHAIRMAN. More than \$14,000 a year. Well, there may have been some reason. If so, it was not followed and at any rate, security has not been impaired.

Is that all, Senator Knowland?

Senator KNOWLAND. That is all.

The CHAIRMAN. Mr. Lilienthal?

**STATEMENT OF DAVID E. LILIENTHAL, CHAIRMAN, UNITED STATES ATOMIC ENERGY COMMISSION**

Mr. LILIENTHAL. Mr. Chairman and members of the committee, it is the Commission's purpose and its hope to conclude presentation of witnesses by Monday noon of next week. The testimony this morning will consist of two parts.

The first part deals with military applications of atomic energy. After some introductory remarks on my part relating to the statute and the Commission's relation to this the witnesses will be the Commission's Director of Military Applications, Gen. James McCormack; Mr. Mervin Kelly, the executive vice president of the Bell Laboratories, Inc.; and Dr. Norris Bradbury, the Director of the Los Alamos Laboratory.

The second part will relate to the production of weapons materials at Oak Ridge, and the witness who will be the general manager, Mr. Wilson, and Mr. Clark Center, superintendent of the Carbide & Carbon Chemicals Corp., the operator at Oak Ridge.

In respect to military applications, I have just this word, principally for the record because it is well known to the members of the committee.

The Commission's responsibilities are derived principally from the provisions of the McMahon Act, notably section 4 (c) (2) and section 6 (a). Section 4 (c) (2) reads in part:

"The Commission is authorized and directed to produce or to provide for the production of fissionable material in its own facilities," and further it is provided that "The President shall determine at least once each year the quantities of fissionable material to be produced under this paragraph."

Section 6 (a) provides:

The Commission is authorized—  
and then the first subsection—

to conduct experiments and do research and development work in the military applications of atomic energy and, (2), to engage in the production of atomic bombs, atomic-bomb parts, or other military weapons utilizing fissionable materials, except that such activities shall be carried on only to the extent that the express consent and direction of the President of the United States has been obtained, which consent and direction shall be obtained at least once each year.

That is to say, under the act the President once a year as a minimum fixes the requirements which bind the Commission in its program activities. The President's determination is, by the practice prevailing since the beginning of the Commission, upon a joint report. There is no requirement that the report shall be joint, but this has been the custom. It is a report which is joint, signed on behalf of the Commission by its Chairman and on behalf of the National Military Establishment by the Secretary of Defense.

This report it has been our custom to make to the President personally, by the full membership of the Commission and the General Manager, and the Secretary of Defense, who is also accompanied by individuals from the National Military Establishment.

How these requirements once fixed by the President are to be met—that is, the program for meeting those requirements—is determined by the Commission after consultation, and ordinarily rather extensive consultation, with the National Military Establishment.

In the formulation of how these requirements are to be met the Commission draws upon the entire organization and a good many of its divisions, notably the Division of Military Application and the Los Alamos Laboratory, the Division of Production, the Division of Raw Materials, the Division of Research and, of course, maintains constant consultation with the General Advisory Committee.

Finally, conclusions as to how these requirements are to be met are developed for the Commission by the General Manager and the Director of Military Application, and in the process of this final development of how requirements are to be met, the Los Alamos Laboratory assumes, of course, major responsibility for execution.

The Director of the Division of Military Application is the General Manager's chief deputy in this area, and he is the chief representative of the Commission itself in the discharge of its responsibilities under the law, under the direction of the President, and under the method of meeting the requirements as developed by the Commission itself.

By provision of the act, section 2 (a) (4) (B), the Director of the Division of Military Application is a member of the armed forces of the United States in active service. Brig. Gen. James R. McCormack has been the Commission's Director of Military Application since the Commission took over the atomic energy project.

General McCormack's staff, the Military Application Division staff, is made up of officers and men from all three branches of the service, plus a number of civilians. As the Director of Military Application is under the General Manager, he is directly responsible for the activities at Los Alamos and at Sandia and is also the Commission's staff member primarily responsible for liaison with the National Military Establishment through the statutory Military Liaison Committee.

The Office of the Director of Military Application is the focal point of the Commission's day-by-day relations with the National Military Establishment, including, of course, the Military Liaison Committee.

General McCormack's deputy is a naval officer who is familiar to members of this committee, Capt. James Russell, who is present here this morning.

I should like, then, to ask General McCormack to carry this presentation further.

**Mr. PRICE.** Mr. Chairman, if I may, we have had testimony on the atomic weapons and the testing of weapons through the hearings, and I think it would be important if we could hear some testimony on what has been accomplished to date about the medical effects of atomic bomb explosions and radiation.

I hope that during the presentation by the Commission some testimony will be given on the peacetime application of atomic energy.

Do you have any plan to make such a presentation?

**Mr. LILIENTHAL.** We had not planned any other than a rather brief presentation by Dr. Shields Warren, the Director of the Division of Biology and Medicine, and Dr. Alan Gregg of the Advisory Committee on Biology and Medicine.

This would be rather a summary of the progress made in this field. There is, however, some very interesting information and experience which has been developed, on the effect of atomic explosions, which could be summarized and presented here in the course of these hearings.

I should think it could be done probably in the course of a half hour, and although this is perhaps not directly applicable to the immediate subject matter of the investigation, it might be appropriately included.

Mr. PRICE. I thought the public would be interested in such a presentation.

Mr. LILIENTHAL. In terms of civil defense, as well as the progress of science and medicine, this is, of course, very proper. With the committee's concurrence, we will see that it is presented.

Mr. PRICE. You will discuss sometime during the presentation some of the peacetime applications of atomic energy?

Mr. LILIENTHAL. We will in the field of biology and medicine, particularly, expand on what we had planned.

I might say also the Commission's semiannual report, which must be filed with the Congress during the month of July, during this month, is primarily devoted to the field of biology and medicine, both as to evidences of peacetime progress and also because of its very direct bearing on civilian defense in the event of atomic warfare.

Dr. Fermi will be here, I believe, tomorrow, and he will have a good deal to say about peacetime application.

The CHAIRMAN. You know, I suggested at one of our meetings last February that it would be a good thing if we took some testimony on civilian defense aspects of atomic energy, and then added as a somewhat sardonic postscript, that perhaps we should not do it because we would let other people know how to defend themselves. About 2 weeks later I read a letter in the *Washington Post*, which missed the fact that I was not too serious about the objection, and they criticized me very much for having suggested that we should take that testimony.

It was quite illustrative of the public mind on it, and I think it would be a good thing if we got some of that in the record.

Mr. LILIENTHAL. Mr. Chairman, this reminds me of earlier statements we have made to the committee about our purpose in seeking to develop a volume devoted to the effects of atomic weapons, an unclassified volume.

It is not too useful to have information—that is, useful for architects, engineers, physicians, nurses, disaster relief officials, and so forth—so highly classified that they cannot have any access to it.

It does present the problems suggested by the chairman's remark. We have been delayed in our concentration on it. It all adds up to this same problem with which we have been wrestling from the beginning: How do we inform ourselves reasonably, without injury to the national defense? And the balance always is: Is it better for us to know this information, would we derive more strength from it than a potential enemy would derive strength?

Well, in this testimony by Dr. Warren you will get a kind of preview of the sort of information which it seems important that the American people must have, the facts being as I believe them to be, as I suggested yesterday in the remarks I had to make, and then weigh the question of how far we have to go in that direction.

**STATEMENT OF BRIG. GEN. JAMES McCORMACK, JR., DIRECTOR,  
DIVISION OF MILITARY APPLICATION, UNITED STATES ATOMIC  
ENERGY COMMISSION**

General McCORMACK. Mr. Chairman and members of the committee, there is entered into your record on June 13 a statement by the General Advisory Committee which contained the following three sentences:

When the Commission took over, the future of the whole enterprise was uncertain, the continuity of production of fissionable materials was far from assured, the design and development of improved weapons was nearly stagnant. In each of these respects, the picture was radically changed. Better weapons have been developed and tested, the production of materials has been substantially increased and assured, and a sound and forward-looking program has been established.

That is the end of that quote from the General Advisory Committee.

Dr. J. Robert Oppenheimer, who appeared before you on that same day, remarked at some length in extension of this statement of the General Advisory Committee, and there are four quotations from his remarks which I should like to recall to your attention at this juncture.

He said:

I think that it is generally regarded by my colleagues that Los Alamos is the best Federal laboratory and the best laboratory working on a military job that there is in the country.

He said further that this laboratory—

has learned a number of things; and it has the courage to try out a number of new things, and it is air-borne. This being air-borne is the result of many things, but it is largely the result of the understanding, the encouragement, the babying if you want, that the Commission has given it. The laboratory could have gone to pieces. It has not.

He also said:

Quite a number of very important improvements in atomic weapons design and atomic weapons manufacture have been worked out. The present program of the laboratory is to carry this further and to get into some new and more difficult things. It is a sound program; it is soundly conceived; and it is going forward full steam ahead.

He also said:

I think the first years of the Commission's administration were in many places a period of great solidification of morale. The laboratory that is closest to me is Los Alamos, and it has certainly changed from the laboratory that was insecure and rather hesitating in its technical work, to a forward-looking, vigorous establishment. The morale of the scientists engaged in making weapons of war is always going to be an unstable thing. We know that. We do the best we can.

That is the end of the quotations I would recall to you from Dr. Oppenheimer.

As regards the quality of the work which has been done in the weapons field during the past 2½ years, I do not intend myself to bring forward any new evidence. I shall try rather to indicate to you how a few of the management problems affecting this work have been approached, and how, through solving these problems in one way or another, we found the means of assuring the performance of the technical work. You may be sure that the work of a laboratory,

for instance, goes forward in the long term only when supported and guided by management which permits and encourages forward motion. You do not get an "air-borne" laboratory—to use Dr. Oppenheimer's phrase—or a solid production program, within the framework of mismanagement.

At the beginning of 1947, Los Alamos was not only the heart of the weapons program—it was in fact the whole of it. And the deficiencies which the Commission found at Los Alamos were many.

This statement is not made, of course, in criticism of the Army management which was then on its way out; indeed as an Army officer myself, I can say that it would be a point of great pride to me had I been connected with the Manhattan project from its beginning until its final disbandment and be in a position to take some credit for its achievements.

However, the simple fact was that at the beginning of 1947 Los Alamos was on its back. The big job then was to sort out from the seemingly infinite number of deficiencies those whose correction should help most in putting the enterprise on its feet again.

It seemed to the Commission that three primary managerial improvements were necessary to enable the laboratory to devote itself to putting the technical work back together.

First, there was needed a long range program of research and development in weapons that made sense from the point of view of military requirements, and also made sense to the laboratory. Such a program was developed and the Commission directed that it be put into effect.

Second, looking toward the future, and looking at the great difference between doing weapons work in peacetime and wartime, we had to find ways of relieving Los Alamos of the work of routine weapon production to enable the laboratory to concentrate more fully on its very vital research and development task. This is easy to say; it is not easy to do.

This business of relieving the laboratory of production is easy to say. It was hard to do.

Third, it was clearly necessary to make Los Alamos into a place which would attract and hold the scientists who would carry out the program of the laboratory. The Manhattan project had begun rather extensive community construction to this end.

All of this had to be done without interruption of a short-term program which would at all times assure continuous production of as many weapons as could be made with the facilities we then had and weapons that were as effective as we could then make.

It was necessary to block out the longer term research and development program in order to give focus to the test program which was urgently required and was carried out the following year at Eniwetok. We, of course, had to make a number of assumptions as to the probable success of the Eniwetok tests. Since those tests, we have found that our assumptions were in the main correct; but of course we have revised them where necessary.

Simultaneously with preparing for the Eniwetok tests we began to remove the burden of routine weapons production from the laboratory. It must be borne in mind that the handful of key people at Los Alamos who had in their minds—not on paper—the know-how of weapons production were the same handful of people who had to

advise and assist in the thoughtful task of laying out the longer term program, and who also had to carry out the extensive and urgent preparations for the Eniwetok tests.

The production task ahead was obviously much larger than the "custom" type of manufacture of the weapons which had been made up until that time. It was clearly in large part an industrial type of job. The Commission, therefore, decided to bring industry into this work and certain technical bureaus of the Army and Navy. In the process of this expansion of production we faced many problems of security, of selection of firms and individuals best suited to the tasks at hand, and of mutual education of scientists and industrialists. We had to arrange also for a complete weapon model change while we were getting production started. The facilities at Oak Ridge and Hanford had to be meshed into the plan. All of this had to be done while a Commission staff, from my office down, and field organization were being built to manage the enterprise, and during a period when the pertinent parts of United States industry were not seeking Government work.

The result, after 2 years, is that the weapons-production program is now on a stable basis. The plants, which are dispersed widely through the country, have cost in excess of \$100,000,000. Thousands of people are now at work in these plants, and the operating budget is a large one. While of course much remains to be done, we believe that all bottlenecks worthy of serious concern in this field have now been broken.

There were at Los Alamos during the peak of the war effort some 3,000 technical workers. At the beginning of 1947 this number had been reduced to approximately 1,500. The Commission has separated those aspects of weapons-development work which need not be absolutely and intimately connected with nuclear developments and are now doing a large part of this nonnuclear work elsewhere. In the process, we are building an ordnance engineering laboratory at Albuquerque, N. Mex. Meanwhile, the Los Alamos Laboratory has gone back up to a strength of some 1,700 persons, devoted primarily to research.

We are relatively in terms of numbers of people devoted to this research and ordnance engineering task about at the same numbers that the laboratory was during the latter part of the war.

The construction of the town of Los Alamos was necessarily begun during an unfavorable period—that is, during 1947 and 1948. The town has cost more to build than it would now cost if we could go back and start all over again. However, had the Commission waited, you would not now have a good laboratory at Los Alamos.

New laboratory construction to replace and supplement wartime facilities was also necessary, but we have held the "replacements" part of this technical construction insofar as possible in a priority second to that of building the town. This is an important point to understand.

The Commission's standing policy has been that Los Alamos shall be built for a program of indefinite duration. This is a most important point. To run a laboratory engaged in such unique work, in a high degree of isolation and in peacetime, it is essential that there be a feeling of permanence to the program.

We have applied throughout the process of revitalizing and expanding the weapons program the highest attainable sense of urgency.

Both Dr. Bradbury and Mr. Tyler have worked under this whip since 1947. It has been the Commission's policy that there shall be no slackening of impetus and incentive if we can possibly avoid it.

As in the case of the main effort of this country during the war years, this policy has had two results: The job is getting done, but there have inevitably been some untidy administrative odds and ends. On this point I would make one general remark: That since the administrative and management effort has as its main purpose the success of the technical effort, one has to look at both to be able to judge either.

So much for my voluntary remarks. I would like to remark on one of the gentlemen who will follow me that Dr. Bradbury needs no introduction to you and no plaudits from me.

On December 31, last year, some 6 months ago, the University of California asked to be relieved of the operation of the Sandia Laboratory. That is our ordnance engineering development laboratory, and liaison with the armed forces, with a rather marked industrial aspect. The university had decided, after careful thought over a period of years, that this type of work was really not suited to an academic institution. They felt it better for the university, better for the Los Alamos Laboratory, and better for the effort at large if another type of contractor could be found.

This posed us, of course, a rather serious problem because it involves the several types of work we have talked about. It also involved a type of program which cannot stop and wait while being built for the future. It has to roll every month and every day.

Many proposals were put forward as to the best way to run the Sandia Laboratory upon withdrawal of the University of California, which they had requested be effected by July 1, and we shall be a little late making that deadline.

Those of us inside the program were a little afraid to judge among the seven or eight major proposals for doing this. We were a little afraid we would be too myopic, that we had been too close to it and might be worrying too much about this week and next week. We decided to go out and find the best type of qualified person in the country outside our program to come in and look at Los Alamos, look at Sandia, look at even the fringes of the production program, and give advice on this point.

Dr. Oppenheimer has said that Los Alamos is the best Federal laboratory in the country. If one were looking for a laboratory to which "Federal" need not be applied, if you were looking for the best laboratory in the country, not a Federal laboratory, I think you would look to the Bell Laboratories, of which Dr. Kelly is the executive vice president.

He very generously gave us, over a period of 6 weeks during March and April, a great portion of his time. He actually spent 3 weeks on the ground in New Mexico, at Los Alamos and Sandia, talking to the armed forces, members of the Military Liaison Committee here in town, all members of the Commission's staff, the Commission and laboratory people, manufacturing employees. He really gave us a working over. He found some fault with us. We had asked him to do so.

Based on his recommendations, we are in the process of finding a new solution to the management and direction of the Sandia Labora-

tory. But in the process of investigation he found many things which I think it is important that you should hear, as well as the Commission, to the extent that they can be said publicly and to the extent that Dr. Kelly may say them. I do not know what he is going to say this morning.

The integrity of the technical and scientific people who are the top in this country goes without question, and it will certainly never be questioned by any of us, but I would invite your attention to the particular point that in addition to this integrity, Dr. Kelly also has an independence from the Commission's programs. This is the end of my voluntary remarks, sir.

The CHAIRMAN. Are there any questions?

Senator HICKENLOOPER has a question.

Senator HICKENLOOPER. General McCormack, I have been somewhat confused about the general down-grading that has been going on as to the Manhattan District. In other words, the general connotation that the Manhattan District was a bankrupt, failed concern, and that it had to be revitalized from the ashes, and so on.

I rather had the idea that the Manhattan District had done quite a job, that it started out with a theory and built an atomic bomb, and that that was the purpose for the Manhattan District. It was a war purpose, and they did quite a remarkable job in 2½ years, at the expenditure of about \$2,000,000,000.

They built many plants, and they started out, as has been said before, a "gleam in a scientist's eye," and the scientists and technicians did produce atomic bombs, and the war was ended.

Now, I am pretty proud of the Manhattan District. It is not a part of my matters here, but at the proper time and if the occasion arises, it is going to be a great pleasure to me to defend what I think is the greatest industrial and scientific accomplishment that has ever been created by man.

So that I do get a little restless once in a while about the depreciation of the Manhattan District, that it had to be taken by the sock heels, if you please, and revitalized.

Now, the atomic bombs were dropped over Japan, I believe, sometime in about August of 1945. As I understand it, that was the purpose of the Manhattan District, to get a bomb on the enemy, and that was accomplished. The war ended shortly after that. Is it not true that the Manhattan District, as a purely military operation for a war purpose, then went into a period of uncertainty? No one knew from that fall of 1945 whether a civilian operation or a military operation would be the policy for this great new atomic project. Is not that your understanding?

General McCORMACK. It is, sir.

Senator HICKENLOOPER. Do you know whether or not the President or anybody else ever gave specific direction to the Manhattan District after the fall of 1945 to go ahead and produce a certain quota of bombs?

Were those directions ever given, to your knowledge?

If that is classified information, I shall not press for it.

General McCORMACK. I have no knowledge on that point, sir.

Senator HICKENLOOPER. I may say I have no knowledge that any direction or orders or program was laid out for the Manhattan District during that uncertain period to go ahead and produce a specific quan-

tivity of weapons, and that, in fact, the Manhattan District did go ahead and hold itself together only pending the determination of the Congress on the policy of this country toward atomic energy.

Now, is that a fair statement, General?

General McCORMACK. It is, indeed, sir.

Senator HICKENLOOPER. So that on January 1, 1947, when the Commission came into power, they took over an organization and an installation that had been held in abeyance dependent upon the public policy that the Congress would adopt. Is that a fair statement?

General McCORMACK. Yes.

Senator HICKENLOOPER. Now, General, I think we have gone ahead and produced weapons in this program, and I have never disputed that. I am raising no issue on that score. But so far as Los Alamos is concerned, of which you have talked quite a little, the same contractor is running Los Alamos now who ran it during the Manhattan District, the University of California.

General McCORMACK. Correct, sir.

Senator HICKENLOOPER. And, generally speaking, the top scientists and top technicians at Los Alamos now are the same—that is, generally speaking—the same technicians and same able scientists who operated it during wartime.

General McCORMACK. Dr. Bradbury was appointed by General Groves, and many of the key people from that time are still there.

Senator HICKENLOOPER. He is doing a grand job, in my opinion, as I have said before, so that we have a continuation of the operation. In other words, there is a continuity, but there was a period of, we might call it “quiescence,” until policy was determined and the Congress did determine that a civilian control would be the policy of this country in accordance with the McMahon Act.

Those are my understandings of the situation, and I merely wanted to be sure that I am not making an unfair statement about the matter.

General McCORMACK. I would certainly hope, Senator Hickenlooper, I have not been misunderstood. I think the Manhattan project was one of the greatest achievements of all time. I truly do. At the end of the war, pending the legislation which was finally passed, I do not think any one—and I speak to the point of Los Alamos—could have done during the period of 1945 to the beginning of 1947 what it has been possible to do since the beginning of 1947.

I think the strength of character and constancy of purpose of General Groves, backed up by then Secretary of War Patterson, held it together as well as it could have been held together.

Senator HICKENLOOPER. And I think there were a great many other outstanding scientists and technicians who furnished that hard core of determination and intelligence. I know you would not leave them out.

General McCORMACK. Absolutely. I speak of what can be done from Washington, and Washington cannot do everything.

Senator HICKENLOOPER. I think that is all, Mr. Chairman.

Mr. PRICE. Mr. Chairman?

The CHAIRMAN. Mr. Price?

Mr. PRICE. I did not understand you to be attempting to depreciate the work of the Manhattan District in any way. As a matter of fact, you stated in your talk that you would have been proud to have been

connected with it during the war. You were merely stating the condition that the Atomic Energy Commission found when it took over the project, were you not, General?

General McCORMACK. That was my purpose; yes, sir.

Mr. PRICE. I imagine you also have a sense of pride in having been associated with the Commission during these few years.

General McCORMACK. I have a dual pride. I am in the Army, and the Army did it first. I am in the Commission, and the Commission took it over.

Mr. PRICE. That is all I have.

The CHAIRMAN. Mr. Holifield?

Mr. HOLIFIELD. You were at Eniwetok at the tests, were you not, General?

General McCORMACK. Yes, sir, for a part of them.

Mr. HOLIFIELD. Part of them? What was the experience of the military in their relations with the Atomic Energy Commission? Was it a satisfactory arrangement that they had? Was it without obstruction and interference, or did they have continuous trouble with the Commission in pulling off that great test out there?

General McCORMACK. Complete satisfaction was expressed both by Secretary Forrestal and by General Hull, who was the Task Force commander, and who is now here in town, incidentally.

Mr. HOLIFIELD. The subject during the hearings has been brought up of emergency clearances for that Eniwetok test. There were several thousand people involved. In your opinion, were the emergency clearances on that test taken care of in a businesslike way; that is, with due regard to the security of the Nation?

General McCORMACK. I think it was very well done, sir.

Mr. HOLIFIELD. If more complicated methods of security clearance had been adopted, would it have delayed the tests appreciably and prevented the culmination of the tests?

General McCORMACK. One gets around complications, Mr. Holifield, if one has time to prepare and lay the groundwork. The trouble we met in connection with preparing for the Eniwetok tests was the short period of time we allowed ourselves, which required a larger number of emergency clearances than would have been required if we had had an additional year to prepare.

The matter of emergency clearances is in a sense like a chain reaction. You have to clear first a person who can discuss a problem to see whether he thinks in general his organization can do it or to see in general how he should map out his organization to do it.

Next, when he has made up his mind—and he might say, “No, I cannot do it,” and then you have to go to another place and start over again.

When he makes up his mind, then there must be one, two, three, four, five or six key people who have to build their part of the pyramid. It builds downward. The question is not, “Does it take 2 weeks versus 3 months as between emergency clearance and the full procedure for an organization?” The question is, “How many successive steps are there to which this gap applies?” If there happened to be four steps, if the difference happens to be a month, then it is not 1 month, it is 4 months. The armed forces, too, would have been, I think, terribly handicapped in creating the task force, which was so very ably

created, had it not been for emergency clearances. If you want to go more in detail on this, Captain Russell, who is here with me, was the test director and ran it from the beginning on through to the end from the Commission's point of view.

I made half a statement a moment ago. I said Secretary Forrestal and General Hull expressed complete satisfaction with the Commission and its work and the laboratory and the people they had to deal with and the methods with which we went about doing our work.

I would like to say the Commission expressed an equal satisfaction with the armed forces. It was a marvelous team. It really was. Those of you who were there must have noted it.

Mr. HOLIFIELD. Thank you.

Senator HICKENLOOPER. Just for the record, I want to say at the moment, as far as emergency clearances at the Eniwetok tests are concerned, they have never been an issue that I raised at all. Any references to emergency clearances that I have made are entirely aside and apart from the Eniwetok tests which had a peculiar situation.

The CHAIRMAN. Were they part of the number—

Senator HICKENLOOPER. There might have been a few in the 30-day period.

Mr. PRICE. I think there were.

The CHAIRMAN. In the gross number?

Senator HICKENLOOPER. There would have been perhaps a few included in the months of perhaps March and April of last year.

The CHAIRMAN. How many were the emergency clearances that we have discussed? Something like 2,800?

Senator HICKENLOOPER. 4,000.

Mr. VOLPE. Close to 4,000. Captain Russell has the figures.

Senator HICKENLOOPER. Just over 4,000.

The CHAIRMAN. How many were in connection with the tests?

General McCORMACK. Captain Russell may have this figure.

The CHAIRMAN. While he is looking for it, General, as I understand the situation, we can analogize it to what we find in Detroit. When they are going to make a new model of an automobile, they build a hand-made model. Every bit of it is made by hand.

After they get the model the way they want it, they put it into mass production. They build an assembly line. If they did not do it that way, of course, we would not have automobiles.

Now, as I take it, the Manhattan District built by hand some atom bombs. When the Nagasaki bomb was dropped that was all we had. Models had been used, according to Mr. Stimson, and then you had to build an assembly line.

Is that a fair analogy?

General McCORMACK. It is a rather scattered line, but I see your point.

The CHAIRMAN. That is what had to be done.

General McCORMACK. It was a question of manufacturing component parts and bringing them together in a scheduled manner. I only point out that the geographical location of our assembly line is different.

The CHAIRMAN. I am analogizing it to industrial production. You had your hand-made models, and now you had to get into production.

General McCORMACK. And we had to prepare for production of the

model which had not been completely developed. It is a tough job to tool up for production before development is completed, and we had to tool up before Eniwetok, gambling on our success. We did not dare gamble on complete success, but we gambled on partial success, and we actually had more success than we had a right to expect. This caused some of the staff to do some of the work over.

The CHAIRMAN. There was an unfortunate period during 1945, 1946, and 1947, but it was not all due to the Congress, either, as one who was right here in the middle of it can very well testify.

Senator HICKENLOOPER. Mr. Chairman, I was not blaming Congress or anybody else. I think it was a normal time in which intensive study had to be made. I do not think there is any criticism of the gap.

The CHAIRMAN. I just wanted to get it into the record that we had a pretty good group of lobbyists around in those days.

Do you have those figures now?

Captain RUSSELL. I can speak to the figures on clearances in the Eniwetok operation. We had a total of 2,504 full "Q" clearances. Of this number, 2,086 were newly processed for the Eniwetok tests.

Our "Q-E" clearances, the great number of which were later shifted to a "Q" clearance, by mid-April numbered 792. "Q-E" are emergency clearances.

The CHAIRMAN. Seven hundred and ninety-two of them?

Captain RUSSELL. That is as of mid-April. I think we probably ran up to around 900 or a thousand eventually by the end of the exercise.

The CHAIRMAN. All right.

Captain RUSSELL. I would like to add also that there was a so-called "P" approval, in which there was an investigation to determine whether a man was fit for the expedition itself. We had 11,281 "P" approvals in addition to these full FBI clearances, and the short-term clearance, the Q-E or Q emergency clearance.

The CHAIRMAN. Thank you.

All right, Mr. Kelly.

#### STATEMENT OF MERVIN J. KELLY, EXECUTIVE VICE PRESIDENT, BELL LABORATORIES, INC.

Dr. KELLY. Mr. Chairman and gentlemen of the committee, as General McCormack has told you, the Commission requested me, in the latter part of February, to make a study of operations on the missile job at Los Alamos and Sandia with the principal object of advising with them as to the best method of carrying forward part of the operation that the University of California wished to withdraw from.

As the General has said, several alternatives had been proposed, and they wished an outside look at the situation and an appraisal of these alternatives and a recommendation. At the same time, the General asked, since it was necessary for me to look at the operations quite closely, that I appraise the general effectiveness and general direction of effort.

Now, the survey that I made was a survey by Kelly as an individual. The laboratories very kindly gave me the time, and my study and the reports that I made afterward were entirely matters of my own judgment and not matters of the laboratories' judgment and responsibility.

The CHAIRMAN. Now, Doctor, you are the director of the Bell Laboratories?

Dr. KELLY. I am the executive vice president of the laboratories, and in that position I am in charge of all internal operations. Dr. Buckley, the president, to whom I report, handles all of the outside relations and policies; all of the organization reports to me.

Now, before going out to the scene of operations, the Commission made it possible for me to get as much background as I wished. It might be called preparatory briefing. That was with members of the Commission and its staff, members of the military liaison committee.

Incidentally, Mr. Webster, the civilian chairman of that committee, went out with me and was there for the first several days of my visit, and General McCormack went, and scientists of the Manhattan District days who had left the project and returned to their places in universities; they were made available to me for discussion.

With that background, I went to the New Mexico area and spent some 18 full days looking in great detail at all operations in New Mexico and also the extension of the New Mexico operations in southern California.

You might wonder as to why so long a time was taken. This is indeed a complex operation; probably as complex as any single operation in applied science. It extends from basic research through development, design, manufacture, and control of manufacture by others, storage, and surveillance. It is an area in which I have spent my whole professional life.

This work, I found, required research physicists, chemists, metallurgists, and mathematicians, electrical and mechanical and chemical engineers, with their various technical skilled aides.

The method that I followed was to have general discussions from time to time with General McCormack, Captain Tyler, Dr. Bradbury, and his two associate directors of the organization as to the philosophy of operations.

I would say that I spent some 10 percent of this time with them. I visited all areas of the work and discussed it with the work leaders. Perhaps 20 percent of the time was spent with the division leaders, reporting to Dr. Bradbury, and 60 percent of the time with those in the organization of the division leaders.

Incidentally, all of my discussions and visits were not supervised or followed by people at levels of the organization above that with which I was working at the time. I was given complete freedom and co-operation by the University of California staff there and by the Commission staff.

The program was my own, and it developed as I went along. I spent about 10 percent of the time, the final 10 percent, with the armed forces special-weapons organization at Sandia, which is the junction point with the Commission on use of atomic missiles.

After this survey, my general conclusion was that it was a very good organization, doing a fine job. As a citizen I was very much comforted, for it had been my belief that because of the importance of this work to national security, the whole missile area, from missile research through manufacture, should be the best that American science, technology, and management know-how could provide.

The set-up that I had studied was well on its way to meeting this high standard and was made up of the ingredients essential to ultimately meeting this standard.

By this I do not wish to imply that all was perfect, for it was not, but considering the low point reached after the war, which has been previously discussed, tremendous progress has been made in less than 3 years.

There has been established a solid foundation for continued progress. You know, good laboratories, like good wine, improve with age, and a perfect laboratory is not built in 3 years.

As was to be expected, there was the greatest need for continued improvement in those areas of the project near the end; those farthest removed from basic research; those involving the know-how peculiar to the industrial scientist, engineering, and management.

I may say this fact was already recognized by the management, the General here, Captain Tyler, and Dr. Bradbury.

I would like to briefly point out the major factors contributing to this sound and promising situation.

First, the environment for the technical job was excellent. By that I mean there had been by the Commission a proper delegation of broad technical authority and freedom to the Director, which is most essential to the technical management of a project of this complexity and special nature. I found Dr. Bradbury had adequate freedom in organization, personnel recruitment and development, and programs. When I say freedom and programs, I do not mean to imply by that that the specially planned specific missile developments or manufacture were not well-programed and heavy pressure was being put on to meet the best that could be done in time on this effort, but in the broad area of research and development management program he had the required technical leadership freedom.

There was also, second, a splendid Commission staff support on all these aids to technology that represent servicing headaches that are most time-consuming and irritating to a technical management, if it has to do it itself, or equally time-consuming and irritating, if they are not done well by others. This aid of the Commission staff to the University of California staff in the general servicing and handling of all of the nontechnical things possible to separate from the technical leadership was in good hands and well handled, and I found a splendid relationship between Captain Tyler and Dr. Bradbury.

Third, the technical management, including Dr. Bradbury's two associate directors and his division leaders, rate high in their competence for the job. That was a thing that was very important to appraise and to evaluate, because in work of this nature, in general any cooperative efforts, leadership is important, but in work of this nature, with the kind of people involved, leadership of the right sort is most essential if results that are possible are to be obtained and high efficiency is to be realized.

Dr. Bradbury and his associates had recognized weaknesses in their staff. There was evidence of that because in the 6 months previous to my being there, two new men were brought into the picture at high levels of supervision, one at division level and one just beneath that, which materially strengthened the organization and plugged up spots that were not as strong as others.

Fourth, the technical staff, the professional staff, was strong. A good job of recruitment had been done during this almost 3-year period, during a period of generally good job opportunities. Those of us in industry, who were going out after the close of the war, trying to do recruitment of scientists, young scientists and engineers, those whom we had not been able to secure during the war, found very stiff competition from our associates, from the other laboratories, and there was generally a scarcity of top people.

The technical staff there under Dr. Bradbury had shown good vision in recognizing that only top men, only superior men were adequate to the needs of this highly technical job.

I can assure you from a very close inspection, seeing probably some 150 or so of the men during this time, and from a close study of the personnel cards, personnel history, training, background, experience, if any, before they came there, of all members of the technical staff receiving about \$4,500 a year or over, that a fine job had been done and that we have a staff of training and superior mentality required for doing this highly technical job.

Fifth, the internal morale was high, and teamwork was good. This is evidence of good leadership and proper environment, but the teamwork is essential in big undertakings of this sort, and the teamwork was good.

Sixth, the laboratory housing was poor. The housing that was put up during the war was put up on an emergency basis and without a complete vision of the whole, and grew rather like Topsy with relatively temporary buildings. The old housing was really inadequate for the permanent kind of job to which the general referred, and which they were setting up there and which should be set up as a permanent job in order to build properly. But there were good plans for improving and building permanent laboratory structures.

I went over those plans in detail with Dr. Bradbury and Captain Tyler, and when they get the housing, the laboratory housing, that is planned, they will have adequate and good facilities. These are essential because proper facilities are one of the important elements of effective work.

Mr. HOLIFIELD. Dr. Kelly, may I ask you a question? In the location of the new development on the new mesa, are you in full approval of the necessity for building the new development and did you approve of the location?

Dr. KELLY. I think that the lay-out for orderly work that will result when they are complete is good. I do not know the pros and cons of other approaches or why that was put on the mesa there as against anything else. I looked at completed plans and thought it through as to how the different elements of the project could operate when the plan was accomplished and completed, and found it good. I cannot speak of alternatives or as to particular reasons as to why that mesa location was chosen.

I found the program balance good and that is very important in an effort of this sort, covering the wide scope from basic research through manufacture. It is most important to a project that is continuing indefinitely that it be balanced and always ready to move forward the technology as rapidly as the total force on the job will permit.

Even with the great and immediate urge for improved weapons and increased manufacture, I found that the fundamental research and development program that insures the future, that provides a reservoir of basic knowledge from which better and much better missiles could ultimately be developed, that it was going on in proper balance to the whole. Also a very active program and good work on improved methods of evaluating what they had.

That is one of the very difficult things in this kind of work. Of course, the final pay-off is the dropping of a missile such as at Eniwetok, but the more you can devise, through instrumentation and through theoretical considerations to get at figures of merit that allow you to move along with no more than the essential tests, the Eniwetok tests, the better work can be done.

As to the outside relationships, the outside relationships are especially important in this isolated laboratory. I would like to speak about those in the different sectors, principal sectors of importance.

First, within the remainder of the atomic energy activities area, by that I mean Oak Ridge, Argonne, Hanford, I found good liaison and good cross-connections of knowledge between the programs. Actually, the week after I left there there was an internal scientific meeting at Los Alamos of the scientists from these different laboratories, all of them being cleared, and, therefore, they could talk about the basic physics that was fundamental to this job. They were having a meeting much like the physical society meetings, except on classified material, and the contacts on matters of business on the technical things that flow between these organizations were in very good standing and being well done.

Lines were open, avenues of communication were open and easy, and so the internal relationships within the Commission were good.

Second, the academic world—that is most important. First, it is most important to the specific job itself; and, second, to the morale and retention of scientists of high caliber. I found evidence that this was being worked at and recognized by the list of consultants that were available to the laboratory. This list would include the names of top scientists of the country who could contribute to different elements of this program. For example, Dr. Bethe and Dr. Teller in the area of fundamental and analytical nuclear considerations. The fact that men of their caliber were willing to give their time and found it worth their while to give their time, some of these men coming there for the summer—Bethe was to be there part of this summer—indicates that they were finding an intellectual atmosphere there that was of a level where they could get stimulation and where their ideas could be evaluated and used. They had a large number of outside consultants who were used to different extents, depending upon the areas of work. So that is in good order.

Finally, the contacts with the user—the armed forces. The armed forces have set up, in the armed forces special weapons project organization, an organization at Sandia that is adjacent to that of the Atomic Energy Commission's activities there, under the leadership of General Montague, and this is a most important relationship—the user to the developer—and needs to be very intimate. In its finest qualities, when it is perfect, there would be no evidence of a boundary line at all. There would be a complete and easy flow across that line.

Actually, in the early days of the Commission there was good evidence that that relationship was not so good. It is steadily improving. The Sandia Laboratory itself has taken the initiative in helping to improve it. General Montague and his people meet that fully. A foundation is set for a continuing better developer-user relationship.

These are the things that I reported orally to the Commission, its staff, and to the Military Liaison Committee in three separate sessions upon my return from this 18-day trip; also, of course, with my recommendations for the handling of this part of the contract that the University of California was withdrawing from.

In addition to the things I have said, quite naturally, I spoke of particular things. I said initially, of course, the job was not perfect; that from my background of experience I thought improvements could be had. Those are of a classified and detailed nature, and I do not need to repeat them here.

Thank you.

The CHAIRMAN. Any questions?

Senator HICKENLOOPER. No, Mr. Chairman, except I am glad to hear Mr. Kelly's report, because I think, in the main, it coincides with my belief that the technical end of this matter has been going along in very good shape, and I think I have observed some of the same things Mr. Kelly referred to about those matters. I do not have any questions to ask him.

The CHAIRMAN. Mr. Holifield?

Mr. HOLIFIELD. No questions.

The CHAIRMAN. Mr. Price?

Mr. PRICE. I would like to ask a few. You stated that you studied the Los Alamos Laboratory in some detail. I wonder if you would care to compare it with other laboratories you know about or have visited.

Dr. KELLY. Of course, its job is a unique job, but as an organization of spirit, enthusiasm and the kind of morale essential to progress of the kind exemplified in our best industrial laboratories. I would agree with Dr. Oppenheimer's statement.

Mr. PRICE. The laboratory is operated, as I understand, by a private contractor.

Dr. KELLY. The University of California; yes, sir.

Mr. PRICE. What do you think of that method of operation?

Dr. KELLY. As exemplified in operations there, I think it is splendid. It could well be, under different circumstances or with a different set of individuals, that there could be roughnesses and unwise lack of cooperation, but as done there, there was none of that, and there can be none of that. It also had the advantage inherent in that situation, inherent in that contract, of easier academic atmosphere. I believe the morale of the men, especially in the forefront of the work, fundamental science and fundamental development, is higher as a part of the University of California, their sense of academic position greater, and their freedom is certainly appreciated in that; and I believe that I could honestly state from discussions with the men and knowledge of that type of man, that many of the key men there would probably not be available in a Government-operated laboratory.

Mr. PRICE. I wonder if you would care to comment on the caliber of management that you observed during your studies that enabled the

scientific and technical advances to be made as you outlined in your presentation.

Dr. KELLY. The quality of the technical management?

Mr. PRICE. Management, in general.

Dr. KELLY. I would separate it into the technical and the general managerial functions of the Commission itself. As I stated, Dr. Bradbury and his echelon of people reporting to him would rate very high as research and development leaders in any industrial laboratory. They have been carefully selected, and, as I have pointed out, they have done some weeding, and I should say they are adequate to the job, and it would be hard to recruit an equivalent group.

Mr. PRICE. I gathered from your statement that you were impressed with the relationship between the Commission and the Military Establishment.

Dr. KELLY. That is right. As I said, it had started from a situation that I would call rough and unsatisfactory to one that I would say is now satisfactory and is moving in the direction of being very good.

Mr. PRICE. Mr. Chairman, that is all the questions I have to ask Dr. Kelly, but I would like to clear up a part that developed earlier this morning on the question of emergency clearances.

Senator HICKENLOOPER. I wonder if I could ask Dr. Kelly just a question. What was the date of the inspection?

Dr. KELLY. From about March 15 to about the 1st of May. I was there two times, and I do not remember the dates. It was during that 6 weeks' interval.

Senator HICKENLOOPER. This year?

Dr. KELLY. Yes; this year.

Senator HICKENLOOPER. Thank you.

Mr. PRICE. Mr. Chairman, earlier in the hearing it was developed that we were talking about the emergency clearances at Eniwetok, and I believe that Senator Hickenlooper stated that he had not raised the question of emergency clearances at Eniwetok; that they were not involved in his general charges in relation to emergency clearances.

I would like to point out the section of Senator Hickenlooper's remarks in the hearings before our committee as printed in part III of our printed report at this time. When we were discussing the question of emergency clearances, there was some question brought up at the time—this is a quotation from the Senator at that time, and it is as follows:

I think it has been amply stated here that the Eniwetok tests were among the most highly secret and carefully guarded experiments and tests that we have had since the first bomb in White Sands in New Mexico. I also state to this committee that the committee knew the approximate time of the Eniwetok tests weeks and weeks before the tests occurred. There was in my judgment ample time for investigation of the personnel and yet I submit, Mr. Durham, on that point, that in the most highly secret and most carefully guarded experiment that we have had many, many emergency clearances were given without any investigation by the FBI, although time was, in my judgment, available for such a situation.

So, I would like to submit, Mr. Chairman, that the clearances in the Eniwetok tests were involved in the general question.

Senator HICKENLOOPER. I recall Mr. Durham mentioning that. The question of emergency clearances does not specifically refer to the Eniwetok tests. It is a current month-by-month policy, is the main point of my reference to the emergency clearances, running month

by month over the last 2½ years, of which Eniwetok could even be left out, or which might be an incident in the entire clearance policy.

Mr. PRICE. Of course, Senator, in another section of this testimony, one of the points brought out in your discourse was the fact that the second year of operation in 1948, instead of 818 people cleared on an emergency basis with access to restricted data, 2,103 people were given emergency clearances.

I would like to point out that the reason for that jump at the time was the Eniwetok tests, so I think this is a perfect question to be considered in connection with the issue.

Senator HICKENLOOPER. Of course, we have not had any Eniwetok tests since April, and the clearances have been running from 115 to 150 a month, which is pretty close to 2,000 a year since then.

Mr. PRICE. Well, of course, I had the personal feeling that the Commission has fully explained those conditions in their previous presentations.

Senator HICKENLOOPER. Except the provision of law that prohibits it.

The CHAIRMAN. Now, we have Dr. Bradbury.

Dr. Bradbury, I am glad to see you.

Dr. BRADBURY. Thank you, Mr. Chairman.

#### **STATEMENT OF DR. NORRIS E. BRADBURY, DIRECTOR OF LOS ALAMOS SCIENTIFIC LABORATORY, UNITED STATES ATOMIC ENERGY COMMISSION**

The CHAIRMAN. There have been some very nice things said about you preparatory to your coming, so you are well introduced.

Dr. BRADBURY. I have been embarrassed to hear them.

The CHAIRMAN. Well, there were some said when you were not here.

Dr. BRADBURY. Gentlemen, my remarks here this morning will deal, I hope, with the general problem of the environment provided by the Commission for what I hope has been a successful operation of a technical laboratory.

You have heard in some detail the story of the difficult period faced by the Los Alamos Laboratory following the termination of the war. I would like to substantiate Senator Hickenlooper's remarks regarding the role of the Manhattan District during this time. It is quite true that we faced and went through very difficult and trying times.

It is also true that the Manhattan District took every possible step that it could to assist the laboratory, to start it out on a permanent career, and that great credit should go to General Groves for the decisions which he made, practically as an individual, during that time.

However, it is quite clear—it was clear to us at the time, it was clear to the War Department, it was clear to personnel that we might want to attract or keep—that neither General Groves nor the War Department could make a permanent commitment. They might have a philosophy, but there was not any guaranty that that philosophy would be borne out.

This sort of assurance, which is essential to the operation of a laboratory, was not forthcoming until the passage of the Atomic Energy Act of 1946 and the establishment of the Commission in the early part of 1947.

I hope it is clear that these steps taken by the Manhattan District during this time were every possible step that could be taken, but even

the best of intent during that time could not entirely prevent the rather continuous decline of morale up to the time of the passing of the Atomic Energy Act. This act appeared to us at the laboratory to be a proper and right thing. The selection of the Commission and their confirmation also appeared to us to be a right thing, the right people for the right job.

At that time, and from that time onward, the laboratory had a stable foundation on which to build.

I would like, therefore, to discuss briefly some of the administrative environmental things which the Commission has provided for the laboratory, not from the point of view that no other institution or organization or group of people could have provided these things, but from the point of view that these things had been provided and that they have contributed in their way to the growth and the progress and the results of the laboratory's technical and research activities.

Let me deal first of all with the matter of setting up a laboratory program. The way in which the Commission has gone about this is as follows: The Commission first asked the laboratory in 1947, in January of 1947, what its senior staff thought the laboratory should be doing.

Accordingly, we presented a program, both a basic philosophy for the long-term operation of the laboratory, and a specific program for the short-term period ahead. This program was based upon the assumption that the Los Alamos Laboratory should be the Nation's laboratory for research and development in the field of the potential military applications of atomic energy.

These applications would have various aspects. At that time there had to be a production aspect because no other laboratory or no other agency was available for the fabrication, the production, and certain other aspects of atomic weapons.

There had to be a short-range aspect to the philosophy with respect to research and development whose goals could be foreseen in 2, 3, or 4 years. There had to be a middle-range philosophy of laboratory goals which might require 5 to 10 years for their accomplishment, and goals toward which progress could not be specifically programmed, but which could be outlined as lying within general fields, and, finally, there had to be goals whose consummation might be 10 to 20 years away and toward which the research would be largely basic and stemming from the philosophy that if there are new ideas which might have military applications these ideas must be found in this country and must be found before any possible competitor can unearth them.

This program, this philosophy, went to the Commission from the senior staff of the laboratory. It was examined by the Commission; it was taken up with the various military agencies. The needs of the military were considered, the contribution of other laboratories and agencies of the Commission to our program were taken into account. These things were correlated, worked together and the program came back to us largely approved, but again coordinated with these other agencies, and with the suggestions of the military people involved, and given to us as directives regarding priority of development, time schedule of development, and questions of that sort.

I hope it is clear that this method of approach is one which is very intriguing and very attractive to the technical personnel operating a laboratory and the scientist feels as if he had a definite part in establishing a program of the laboratory; when it is done, he feels that he

has contributed the best technical ideas that he can to national policy; that these have been considered, they have been coordinated with other necessities, needs, and programs; and that he is an integral part of the technical program of the country in this field.

The next thing which I consider the Commission has done for us, and done well, is to provide us with a satisfactory contractual relationship.

As has been said, the University of California operated the laboratory for the Manhattan District during the war. At the close of the war, and at the time and up to the time the Commission took over, the Manhattan District requested that the University of California continue. This they did, recognizing that this was an interim situation, ultimately to be clarified by legislation.

Various possibilities of operating the laboratory were considered by the Commission when they took over in January of 1947. It was our opinion at the laboratory that an academic contractor provided the best possible administrative framework for the operation of a laboratory whose primary philosophy was research and development.

There are a number of reasons for this: Perhaps, the most conspicuous is the fact that by far the larger part of our technical staff and practically the entirety of our senior technical staff have academic backgrounds. They are accustomed to working for academic institutions; they are accustomed to working in academic environments, and the success of academic laboratories in advancing fundamental knowledge is one of the conspicuous attributes of the research progress of this country.

A strong academic contractor, with experience in operating research and development activity, with experience in handling technical personnel, knowing their needs, their requirements, their psychological reactions, seemed to us an extremely important thing. We were of that opinion in 1947; we were glad the Commission shared it. We still are of this opinion, and I believe the Commission still is of the same opinion, as well.

The first start, to take up another subject, toward a permanent Los Alamos Laboratory was, as I have said, made by General Groves when he initiated in the early part of 1946 a permanent housing program.

This was a drastic step on his part. It did good. This program was continued and amplified by the Atomic Energy Commission, following their assumption of duties.

I cannot emphasize to you too strongly the importance of providing for technical personnel adequate homes, adequate community facilities, adequate schools, and adequate medical care.

You must remember that during the period following the war—and it is true at the present time—that senior technical personnel—for that matter junior technical personnel—have had offered to them a wide variety of jobs. There are intriguing academic offers; there are numerous industrial offers. No scientist has to work on atomic bombs, nor does he have to live in a Government community where he cannot own his own home, but he chooses, and it is important that we offer an excellent environment to these people, which is as near normal as possible, so that they can be proud to live at Los Alamos; they can be happy to live there, and their families can be happy.

The patriotic motive is strong in people, I will admit. It has gotten more so in the years following this war. The necessity of doing this type of work appeals and appears to more and more people as a strong thing. However, a patriotic motive cannot be counted on to induce people to live under wartime conditions, under boom-town conditions, under conditions resembling a Government construction camp.

I think the steps that the Commission has taken to make Los Alamos a good place to live have not only been essential to our progress but they have been instrumental in our progress.

Senator MILLIKIN. Mr. Chairman, may I ask a question, please?

The CHAIRMAN. Surely.

Senator MILLIKIN. I am not challenging anything that you have said. Is it not true that this subject of atomic energy is the hottest subject in science at the present time?

Dr. BRADBURY. I would say so.

Senator MILLIKIN. I mean, does not a young scientist or an old scientist wish to identify himself with this coming development?

Dr. BRADBURY. Yes. I would like to speak to that point a little bit later, if I may.

Senator MILLIKIN. There is a very strong impulse for any man in any profession to identify himself with a coming part of it. Is that not correct?

Dr. BRADBURY. You are quite right, sir, and I would like to mention this—

Senator MILLIKIN. Is it not correct also that due to the money that we are spending, and whatever techniques are used in spending the money, that we are enabled—we are put into a position—to offer the scientist laboratory equipment and all of the technical things he needs to do an efficient job far beyond the ability of, let us say, the average college to provide? Is that not correct?

Dr. BRADBURY. It is quite true, sir. It is also true that the nature of the experiment that would have to be conducted in the frontiers with respect to nuclear physics and nuclear chemistry are very expensive experiments. They require elaborate equipment not available. They could not afford them.

Senator MILLIKIN. You could not find them in the average college?

Dr. BRADBURY. That is right.

Senator MILLIKIN. You could not find them in any college, the Government of the United States is alone able to furnish the kind of equipment the scientist wants to work with, and therefore that provides an additional attraction for his association with this great enterprise.

Dr. BRADBURY. That is very true.

Senator MILLIKIN. I am simply developing some of the inducements to scientists to come into the business, perhaps, in addition to the desire to have comfortable quarters and all of the other things that you have mentioned.

Dr. BRADBURY. That is very true, and since you have brought the subject up, I might elaborate just a moment more on this. It is true we are attracting personnel at the present time. We are successful, I believe, in attracting both new, young personnel, fresh from graduate work, from schools and universities; we are attracting also senior

personnel. There are various reasons for this: One reason you have mentioned, the challenge of a new field in science, supported by equipment, facilities unobtainable elsewhere.

Another reason is our forward-looking program, our permanence program, the general philosophy of the laboratory, the environment in which it works.

Another reason is the community which has been established there. It must be pointed out that we have to compete with certain attractions elsewhere, and we have certain difficulties of our own. It is not customary for scientists to work under conditions of security. The question of badges, the question of classified documents, these are something which are new to science, something which has come in since the war.

There is always the attraction in academic fields of freedom to do precisely what you want in the way of research.

At Los Alamos, of necessity, we have to suggest that research be conducted in certain fields, in certain programs. Research is programatized.

Senator MILLIKIN. My only point is, Doctor, they did not stand there entirely helpless so far as attracting personnel is concerned.

Dr. BRADBURY. Far from it.

Senator MILLIKIN. You are in the hottest scientific field in the world. You are in a field where every ambitious scientist wants to get. You have something to offer him which no one else can offer, and I should think that that, together with these housing things and all of these other matters that you mentioned, would be very helpful to you.

Dr. BRADBURY. It is extremely helpful.

May I make only one more remark?

Senator MILLIKIN. I bring this up—if I may add this observation—I think there is an unfortunate impression developing that the scientist is a sort of temperamental fellow who must be babied and given all sorts of special privileges.

I hope that we can get rid of some of that impression before this hearing is over, that after all he is a normal American citizen who takes his knocks, as well as the good things, as do other people, and that he is not a temperamental fellow who must be coddled and babied every moment of his progress through life. I think it would be very helpful if we could get something of that into this record before we get through.

Dr. BRADBURY. You are quite right.

Senator MILLIKIN. Who does not want a good home to live in? Who does not want a good school to send his children to? Who does not want these things that you are talking about? That is an ambition of every citizen, and I am glad that we can gratify it in this field. I wish it were gratified for everybody in the United States.

Mr. PRICE. Dr. Bradbury, would you describe it as temperament, as being temperamental among the scientists, possibly a fear among the scientists, that eventually he may be so restricted that he would never be in a position to accomplish the things that he would like to accomplish with his science?

Dr. BRADBURY. I think that one must regard scientists as people. There is this worry, but it is not an overriding worry. We have to be careful about it.

You, on this committee, have to be careful about this whole question of security, that it does not become an overriding question. This is so arranged that the progress and freedom to progress is guaranteed. This involves serious questions which people cannot debate, but there are questions which do have reasonable answers, to which reasonable answers have been found.

Mr. PRICE. But there is more than temperament involved.

Dr. BRADBURY. There is very much more than temperament involved; and I do not think our people are particularly temperamental. There is a problem which we have not considered here in detail, the things that Senator Millikin has just discussed, and they are, of course, very important; but to a man who is looking at this long-range program about which we are discussing, this 10- to 20-year program, these are very challenging fields to work in.

However, we have other short-range jobs where the work has to be very much more closely programatized, if you see what I mean. There I have to tell a man, "Will you please do this job, this specific job." It may not be looking at a new field of nuclear physics. It may be a very practical job which we have to get out in, say, 2 years. This takes men of the same caliber, same ability, as men who are looking 10 to 20 years ahead.

Senator MILLIKIN. This business of job security is another thing that plagues everyone. A Congressman has to go up against it every 2 years; a Senator every 6 years. There is much insecurity in the business. [Laughter.]

Dr. BRADBURY. Well, to a scientist, I think he generally feels that if he has a laboratory he feels he will be secure.

Mr. HOLIFIELD. Mr. Chairman?

The CHAIRMAN. Mr. Holifield?

Mr. HOLIFIELD. Dr. Bradbury, I want to ask you if in the normal pursuit of his avocation, a scientist does not like to go to scientific gatherings and present papers and expositions on the work that he has been conducting in his research. Is that not an important part of his life, that he be free to talk about the work that he has been doing, and to receive such recognition as he may have earned through intensive research and study?

Dr. BRADBURY. That is quite true.

Mr. HOLIFIELD. And is it not to a great extent barred in this particular line of work; that the scientist may come and work in this work but he is prohibited by the very nature of our national defense security from following out his usual habits along that line?

Dr. BRADBURY. You are quite right.

On the other hand, the Commission has recognized this particular problem and taken a very positive step to deal with it.

The Commission conducts semiannual meetings of its cleared technical personnel. These are called information meetings at which restricted data are discussed, not weapons, however, but restricted data not in the weapon field, in which restricted data are discussed by scientists from different laboratories.

Mr. HOLIFIELD. So they have tried to supply that lack. I have talked with several of the scientists myself, and they have all complained about that.

Dr. BRADBURY. There does exist in the Commission framework a very definite method of dealing with this particular problem.

Mr. HOLIFIELD. And while it is in existence it does give them a certain amount of recognition among themselves.

Dr. BRADBURY. Among their fellows.

Now, these meetings are large enough so that they comprise enough people to talk to so that one feels very much a part of a large technical, scientific group, where one can make a contribution which can be talked about and whose impact upon other laboratories can be considered.

Mr. HOLIFIELD. That brings up a thought in my mind: I find out as we go along in these hearings we have different testimony as to the progress, the technical progress, of the atomic energy program, and we find different environments which have been created jointly between the Commission and its contracting authorities, and the military liaison, and so forth; and I think we would be rather lax if we did not point out the importance of the Commission's work in making these arrangements satisfactory and adapting this program to the point where it is agreeable to its contracting authorities, and to the military liaison people; certainly we should give them full credit because it is in that field of coordination and making these adjustments for the benefit of the different feelings of the different contracting and participating parties, it seems to me, that it is in that field that real management is evidenced because it is in that field that monkey wrenches could be thrown into the complete machinery, and the complete morale, and a complete integration and coordination of the whole project could be absolutely left out to the detriment of the whole program, unless there was evidence on the part of the management of good judgment and ability to coordinate these things.

Dr. BRADBURY. I think you are quite right, sir. It is a very difficult problem, and it is a new problem faced by this country, the operation of laboratories of this sort, with so grave responsibilities and such ambitious responsibilities, under conditions of security in many cases with the Government communities, which is something new that this country is trying.

Mr. HOLIFIELD. It is something that you cannot, in other words, divide—you cannot divide this program and say that the technical advances have been made without giving some credit to the management of the thing, any more than you can take certain mistakes which have been made and say that management is not responsible for them, because if they are responsible for the mistakes, they are certainly responsible for the developments along the progressive lines.

Senator MILLIKIN. Doctor, I take it that this prestige element is very important. The Congressman who has just spoken mentions the papers that the scientists love to write. I think there probably has been some restriction on that.

The lawyer builds up his prestige by winning cases when he does, and the doctor by not having too many of his patients die; and we all have the same thing, the Senator by making headline speeches—we all have our methods of building up prestige, and I am quite concerned with those restrictions that do rest on a scientist in this business of writing papers.

I notice, in looking over biographies, that that sort of activity seems to be very important from the prestige standpoint. Dr. Bradbury writes a paper, and he says in the course of it "as was so learnedly said by Dr. McMahon"; they pat each other on the back, and finally, Dr. McMahon gets a degree from his college for Dr. Bradbury; Dr. Brad-

bury gets a degree for Dr. McMahon. It is a great business, and I am for it. [Laughter.]

I recommend Dr. McMahon right now. [Laughter.]

I am serious that we ought not to put too many restraints on that prestige-building morale factor, and I am curious as to how that is going to be handled and, at the same time, preserve the security.

Dr. BRADBURY. I would like to subscribe to the Senator's thesis that the joint committee members receive Ph. D.'s in nuclear physics, because I am certain they have been exposed sufficiently to it.

Senator MILLIKIN. That would include Dr. Lilienthal, then, because I seem to remember a headline, "Great scientist speaks on atomic energy."

Dr. BRADBURY. I thought he had received this.

Senator MILLIKIN. I nominate him also. [Laughter.]

Dr. BRADBURY. The thing you mention is a very serious one and, frankly, it strikes most deeply at the young man just out of graduate school whose scientific career is going to be judged in part by the papers which he publishes over the next 5, 10, or 15 years.

Now, we find two ways of handling this: It has not proved to be quite as serious a problem as many of us thought it would be. In the first place, a certain amount of research which we conduct lies in fields so basic, nuclear physics or nuclear chemistry, that it can be declassified and published.

The Los Alamos Laboratory over the past 2 years has published several hundred papers, declassified papers, in various fields of nuclear physics and chemistry.

This is good for the people who get them published. Not all of our people can publish. For them we have to find another method of self-expression.

As I said, these information meetings which the Commission holds are now large enough and comprise a sufficient body of people and exchange of documents of this nature between Commission laboratories, which is worked out on a very careful plan, and is now providing this means of public self-expression within a confined group of people.

Admittedly the group is confined. It is not a public group, but it is a large enough group so as to constitute almost the same thing, and if a man writes a good paper in some restricted data field, this document then is circulated to various laboratories entitled to receive it, and he gets credit and recognition among the staff of those laboratories, and this is good for his ego, so there is that way of handling it.

Another way in which we try to handle it is to try to provide some circulation among the laboratories so that a man does not always work in a field which is completely restricted and completely classified, but has some opportunity to work in a field which can be declassified.

Senator MILLIKIN. Am I correct in saying that this great advance in science comes from scientists picking each other's brains in these conferences which you are talking about?

Dr. BRADBURY. Great advancements come from these.

I should like to mention one or two more specific cases of administrative environment provided by the Commission which, in my opinion, have contributed to the pleasure of running the laboratory—not always pleasure.

I have mentioned housing: The housing at Los Alamos, as I am sure this committee is aware, has always been a problem, a serious problem. There has never been enough.

The manager, Mr. Carroll Tyler, established a housing board for the general allocation of housing. This board is comprised of one member from the laboratory, a member from a major contractor, and a member from the AEC staff itself.

Both Mr. Tyler and I have accepted the recommendations of this board with regard to the distribution of housing. I, of course, have had to reserve the right of appeal—appeal to Mr. Tyler in case of a decision of the board which would affect in some way the laboratory program.

Over 2 years of operation have passed and I have not yet had to appeal a single case, a single decision.

This again, I think, is an instance of the cooperative effort at Los Alamos between the Commission and the laboratory. The problems are viewed as joint and mutual problems, and the effort to attack them and solve them is a joint and mutual effort.

The same sort of attack has been given to our security problems there. We have a security board. This board is comprised of technical personnel from the laboratory, administrative personnel from the laboratory, and representation from the security staff of the Atomic Energy Commission.

The purpose of this board is twofold. It is to obtain from the laboratory a technical estimate of those things which it is important to protect. This information, this material which is important—and the grades of importance of things, and to utilize at the same time the knowledge of security—is in how to protect things. In this way we get a coherent program. In this way we also get a feeling on the part of technical personnel that security is making the best possible use of technical advice, and out of this comes a feeling of integration, a feeling of oneness between the laboratory and security in that the right things are being done at the right places.

Senator MILLIKIN. Dr. Bradbury, there has been considerable evidence which might be interpreted as indicating inadequate procedures in the laboratory insofar as running an accurate inventory of fissionable material is concerned.

Could you direct your observations to that?

Dr. BRADBURY. The problem of accounting for so-called S. F. materials is a very complicated and technical problem.

Senator MILLIKIN. May I make it a little more specific as I recall it? An alleged loss involved—

Mr. Chairman, how many months was it before it could be determined as to whether there was a real loss?

The CHAIRMAN. Five months.

Senator MILLIKIN. Five months. Five months is a long time in this business, Doctor.

Dr. BRADBURY. That is quite true. However, one is faced with certain technical problems which involve the fissionable material itself, and in some cases it is impossible to know precisely what you have. If you spent your time finding out precisely what you have you would not have any practical weapon. I do not want to go into the technical details of this, and I am sure you would not wish me to. I am not stating that one should not devote every effort to making sure that

one's accounting procedures, one's technical procedure, one's security procedures are as adequate as they can possibly be made. I think one must not lose sight of the objective, and that is to prepare weapons.

Senator MILLIKIN. I do not think you would suggest that in order to have production you have got to sacrifice security. Is there not a middle place?

Dr. BRADBURY. Yes.

Senator MILLIKIN. Where you can have as much security as is possible and, at the same time, move ahead with production?

Dr. BRADBURY. This is the ground one seeks to attain. It has to be a middle ground between the problem of getting a job done in the most expeditious way by the people, and the problems of counting every atom hour by hour.

Senator MILLIKIN. It is not a question of leaving the spigot open—

Dr. BRADBURY. Correct. This is a very complicated problem, and one to which we devote a great deal of attention.

Mr. VOLPE. Mr. Chairman, the particular problem Senator Millikin made reference to did not concern Los Alamos.

Senator MILLIKIN. I was not talking about that.

Dr. BRADBURY. We have the same general type of problem, and we have to face it, and all I can say is that we are doing all in our power to handle this question to the satisfaction of the Commission.

Senator MILLIKIN. I think the testimony indicates that you gentlemen ought to devise better techniques for determining what you have on hand to start with, and in process, and after you have finished.

Dr. BRADBURY. This we are doing.

The final example which I would like to give of administrative environment has already been touched on by General McCormack, and that is the Eniwetok operation.

This, from a technical point of view, was very satisfactory, and a source of pride to the laboratory.

From an administrative point of view the cooperation, the technique of setting up the operation by the Commission, seemed to us practically a fantastic success.

The operations were smooth; the Commission provided the most senior members of its staff to make sure that our relations, our techniques of operation with the military were carried out in the best possible way.

I can only have the highest praise for that type of operation.

As I have said, we are attracting men; I think we shall continue to attract men, continue to attract good men.

I do not say that these things have been accomplished only because of the Atomic Energy Commission. I do say that the Commission has provided an environment which has permitted this, and has facilitated it. Doubtless it could have been done in other ways. I would say it could have been done well when it would be not hard to do it poorly and make it more difficult.

Senator MILLIKIN. What, may I ask, in bringing it down to cases, does a senior scientist get in the way of accommodations or assignments? Does he get a house?

Dr. BRADBURY. You mean a senior scientist with a family.

Senator MILLIKIN. Yes.

Dr. BRADBURY. A senior scientist with a family will get a house, which depends upon the size of his family. We are not yet in a position to give a man all the bedrooms he would like, unless the size of his family warrants it.

Senator MILLIKIN. You have no restriction on the size of his family? [Laughter.]

Dr. BRADBURY. We have no such restriction. I would hesitate to enforce it.

Senator MILLIKIN. Does he get heat? Does he get his heat supplied?

Dr. BRADBURY. He pays a standard charge, depending upon the size of his quarters, for his utilities.

Senator MILLIKIN. And electricity?

Dr. BRADBURY. This is included in his utilities. He pays rent and a charge for utilities.

Senator MILLIKIN. Is the shopping, are the stores under the control of the Commission?

Dr. BRADBURY. The stores—you are getting me slightly off my field here—the stores are, by and large, in fact I think in every case, leased to concessionaires, concessionaires of the Government, subject to leases.

Senator MILLIKIN. He is able to buy his food at reasonable prices?

Dr. BRADBURY. The prices are identically the same as those at Santa Fe. In fact, one of our supermarkets, so-called, used the same advertising at its Los Alamos store as it does at its Santa Fe store, identical.

Senator MILLIKIN. What rent does he pay for his house?

Dr. BRADBURY. For a three-bedroom house of our best category, of the type of western area type house, the rent is approximately \$75 a month, and there is another \$15 or so for the utility charge.

Senator MILLIKIN. Very fair.

Dr. BRADBURY. That is a fair rent. A house has roughly 1,000 square feet of area.

I think I have possibly give you some of my own ideas on the nature of the collaborative effort between the Commission and the laboratory in establishing its program and in handling administrative problems.

I think this is very important, it has been very important to me as an individual. I will not say, and I know you would not believe me if I did, that we have always agreed with the Commission. We have had our areas of disagreement. They have asked us questions about administrative procedures, and we have given our own ideas and have been very quick to give them.

There have been times when they disagreed and disagreed strongly, but we have disagreed, I believe, on the basis of how to get a job done, recognizing that the job is there to be done, and have disagreed as to the best way to accomplish it.

Now, this is a field in which they respect our ideas and, I am sure, we respect theirs. We have not disagreed, as far as I can recall, on any technical question.

Senator MILLIKIN. One thing about this disagreement business, if you disagree one of you is apt to be right. If you agree, both of you may be wrong. [Laughter.]

Dr. BRADBURY. Well, I am not even sure that I agree with your first statement, sir. [Laughter.]

This is essentially the nature of my remarks.

The CHAIRMAN. I see. Are there any questions?

Senator HICKENLOOPER. I do not want to ask any questions, but as I said before, Doctor, I think you and your group out there have done a grand job, and I think the country owes you a vote of thanks for the long years of devotion that you have given to this great subject, and I think you are making progress.

Dr. BRADBURY. Thank you, sir.

Senator HICKENLOOPER. I have no further questions.

The CHAIRMAN. Thank you very much, Doctor.

Senator HICKENLOOPER. I may say, Doctor, that I have repeatedly said that I am not raising any criticism against the scientific progress in this whole enterprise.

Dr. BRADBURY. So I understand.

Senator HICKENLOOPER. My criticism does not go to that point at all, and I am glad to read your testimony about progress this morning, but it does not touch the matters that I am concerned with in this enterprise.

The CHAIRMAN. Now, I take it that that concludes the Commission's presentation for today?

Mr. VOLPE. No, Mr. Chairman. We have Mr. Wilson and Mr. Center.

The CHAIRMAN. I did not know that.

Mr. LILIENTHAL. Mr. Chairman, would it be appropriate, prior to that time, to read into the record the communications that passed between the Secretary of Defense, the late James Forrestal, and the Commission, indicating the quality of harmony and integration between the civilian and military segments of that operation, or would you prefer that we defer that to some other time? The question has been raised, and it is relevant to this whole question that Dr. Bradbury has been discussing, and also Dr. Kelly. We can either put them into the record or read them.

The CHAIRMAN. I would rather put them into the record, Mr. Lilienthal, for this reason: I would like to get on, and I doubt if we can finish with Mr. Center.

Would you rather reserve them and read them later?

Mr. LILIENTHAL. I think so.

The CHAIRMAN. All right.

Mr. VOLPE. Mr. Chairman, while they are getting to the table here, on this matter of names of contractor employees and their salaries, I asked that that be checked, and the answer is that the original list of names and salaries was not classified. There was a supplementary list sent up, which included names of individuals engaged in the weapons program, which for security reasons, it was felt should be classified "Confidential," and it was a supplementary list that was classified.

The CHAIRMAN. Thank you.

**STATEMENT OF CARROLL L. WILSON, GENERAL MANAGER, UNITED STATES ATOMIC ENERGY COMMISSION; ACCOMPANIED BY CLARK CENTER, GENERAL SUPERINTENDENT, CARBIDE & CARBON CHEMICALS CORP.**

Mr. WILSON. Mr. Chairman, at the time that matters at Hanford were under discussion, Mr. Winne, of the General Electric Co., described some of the operations there, and some of the progress which had been made during the past two and a half years.

At Oak Ridge the operator of the technical facilities of the Commission is the Carbide & Carbon Chemicals Corp., which is a part of the Union Carbide Co.

The Carbon & Carbide Chemicals Corp. was asked early in 1943 by the Manhattan District to become the operator of the gaseous diffusion plant, and their association with the project dates from that time.

Early in 1947, when it was planned to put the electromagnetic plant at Y-12 into stand-by condition, the operator of that facility, the Tennessee Eastman Co., asked to be relieved of this job, and the Commission asked the Carbide Co. to take over the operation of the facility in its stand-by condition, and to carry on development work on improvement of the electromagnetic process.

Early in 1948 the Commission also asked the Carbide Co. to assume responsibility for the operation of the Oak Ridge National Laboratory, and to bring about any integration of the three facilities at Oak Ridge.

Reference has been made by Mr. Williams to some of the aspects of the impressive performance record of the Carbide & Carbon Chemicals Corp. in the tasks which they have undertaken at Oak Ridge, both in terms of increased production and in the reduction of costs.

This company has applied to the operations for the Commission at Oak Ridge the techniques and know-how of a very successful industrial concern, and has applied these in the conduct of our operations at Oak Ridge.

I would like to ask Mr. Clark Center, who is general superintendent for the Carbide & Carbon Chemicals Corp. at Oak Ridge, to speak of some of the operations which they have conducted there, and some of their working relationships with the Commission.

Mr. Center has been associated with this project since February 1943, and has for 22 years been a member of the Carbide & Carbon Chemicals organization. Mr. Center.

Mr. CENTER. Mr. Chairman, I would like to speak briefly on the relationships existing between our corporation and the Atomic Energy Commission.

In order to do this effectively, I must again go back, as many of us here have done, to some of the developments which led up to the extent of our operations in Oak Ridge.

When we first came on the project in early 1943, other groups were established and were doing very much of the important work in regard to research and development.

The main part of this work was done by Columbia University under the direction of Dr. Harold Urey and Dr. John Dunning.

This group was called the S. A. M. Laboratory. It was their function, as I have just said, to do all the research and development which led into a successful operation for the separation of fissionable materials.

The engineering and preparation of the final drawings was the responsibility of the Kellogg Corp., which is a subsidiary of the M. W. Kellogg Co.

Our responsibility, that is, Carbide & Carbon Chemicals Corp.'s responsibility initially, was to review the process design and specifically the final working drawings to be satisfied that the plant was operable.

Emphasis, as the plant neared completion, was on operations.

As time went on it became apparent to us, that a better job could be done if all these various phases which led to the design of the plant were coordinated and done at Oak Ridge. This opinion was also concurred in by the Manhattan District.

Before the close of the war, various members of our organization met with the people concerned, and plans were laid to effect this. As time went on also, and because the electromagnetic process had always done the final chemistry of the product from K-25, it was the opinion of the Manhattan District, and later under the Atomic Energy Commission, that we should be asked to operate that plant.

We have done that since May 4, 1947. Later we were also asked to operate the Oak Ridge National Laboratory and have been doing that since March 1 of 1948.

Among some of the accomplishments, approval of which was asked of the Commission, and which was granted, in the manufacturing line is the production of a special plastic known as flurothene which is needed in the process operations at Oak Ridge.

The manufacture of barrier, which is the material which makes diffusive separation of gases possible, also was undertaken and is being produced in Oak Ridge.

The original consolidation of the various groups at Oak Ridge with respect to operations led also to the design of an expanded diffusion plant. We are busily engaged in that now.

At the electromagnetic plant, the notable improvements made include improvements in the final method of handling the product from K-25. We have also assumed there, at the request of the Commission, manufacturing facilities and operation of those facilities for the production of weapon components. This work is very closely coordinated with Los Alamos.

With respect to our relationships with the Commission, I consider the Commission itself in the same light that I consider our board of directors. It is to them that we look for the over-all basic policies, the general direction of the program.

Their direction and policies established for the accomplishment of this purpose have been very farseeing and have enabled us to work within the framework of those basic policy decisions.

In the determination of these policies, we are generally consulted first, and have the benefit, too, of our experience in operating our own private business, and our suggestions are considered carefully.

In regard to our relationships at Oak Ridge, we are in daily communication with the people there who represent the Commission. Their outlook toward our operation has been very helpful, and has been a great aid to us in accomplishing our work.

The CHAIRMAN. Are you through?

Mr. CENTER. Yes.

The CHAIRMAN. Senator Hickenlooper?

Senator HICKENLOOPER. I do not believe I have any questions.

The CHAIRMAN. No further questions?

Senator HICKENLOOPER. Except this, Carbon & Carbide has been in this continuously since during the Manhattan District days?

Mr. CENTER. Yes.

Senator HICKENLOOPER. Is that true? I do not believe I have any more questions.

The CHAIRMAN. Any other witnesses, Mr. Volpe? I guess you are the ringmaster, are you not?

Mr. VOLPE. I am the errand boy. [Laughter.]

The CHAIRMAN. Have you got anybody else?

Mr. VOLPE. Not this morning.

Mr. WILSON. Not this morning, Mr. Chairman.

The CHAIRMAN. All right. I am advised that tomorrow you will produce Mr. Parker, president of the Detroit Edison Co., chairman of the Industry Advisory Committee; Mr. Isaac Harter, vice president of Babcock & Wilcox, member of the Industrial Advisory Committee; Dr. Lee DuBridge, president of California Institute of Technology, and member of the GAC; and Dr. Enrico Fermi of the University of Chicago, a member of the General Advisory Committee who, of course, has a great reputation.

All right, gentlemen, we will recess until 10:30 tomorrow morning.

(Whereupon, at 12:50 p. m., the joint committee adjourned, to reconvene at 10:30 a. m., Friday, July 8, 1949.)

2

1. The first part of the paper is devoted to a discussion of the various methods which have been proposed for the determination of the rate of reaction of a substance with oxygen. The methods are classified into three groups: (a) direct methods, (b) indirect methods, and (c) methods based on the measurement of the change in the physical properties of the system. The direct methods are those in which the rate of reaction is measured directly by observing the change in the concentration of the reactants or products. The indirect methods are those in which the rate of reaction is measured indirectly by observing the change in some other property which is related to the concentration of the reactants or products. The methods based on the measurement of the change in the physical properties of the system are those in which the rate of reaction is measured by observing the change in some physical property of the system, such as the change in the volume of the system or the change in the refractive index of the system.

2. The second part of the paper is devoted to a discussion of the various factors which influence the rate of reaction of a substance with oxygen. The factors are classified into three groups: (a) physical factors, (b) chemical factors, and (c) biological factors. The physical factors are those which influence the rate of reaction by changing the physical properties of the system, such as the temperature, the pressure, and the concentration of the reactants. The chemical factors are those which influence the rate of reaction by changing the chemical properties of the system, such as the nature of the reactants and the presence of catalysts. The biological factors are those which influence the rate of reaction by changing the biological properties of the system, such as the presence of enzymes and the state of the system.

3. The third part of the paper is devoted to a discussion of the various applications of the study of the rate of reaction of a substance with oxygen. The applications are classified into three groups: (a) industrial applications, (b) medical applications, and (c) biological applications. The industrial applications are those in which the study of the rate of reaction of a substance with oxygen is used to improve the efficiency of industrial processes. The medical applications are those in which the study of the rate of reaction of a substance with oxygen is used to improve the treatment of diseases. The biological applications are those in which the study of the rate of reaction of a substance with oxygen is used to improve the understanding of biological processes.

# INVESTIGATION INTO THE UNITED STATES ATOMIC ENERGY PROJECT

---

FRIDAY, JULY 8, 1949

CONGRESS OF THE UNITED STATES,  
JOINT COMMITTEE ON ATOMIC ENERGY,  
*Washington, D. C.*

The joint committee met, pursuant to adjournment, at 10:40 a. m., in the Caucus Room, Senate Office Building, Washington, D. C., Senator Brien McMahon (chairman) presiding.

Present: Senators McMahon (chairman), Vandenberg, Millikin, Knowland, and Hickenlooper; and Representative Holifield.

Also present: David E. Lilienthal, Chairman; Sumner T. Pike, Commissioner; Lewis L. Strauss, Commissioner; Gordon E. Dean, Commissioner; Henry D. Smyth, Commissioner; Carroll L. Wilson, General Manager; Frances Henderson, Assistant to the Chairman; Joseph Volpe, Jr., General Counsel; Bennett Boskey and Everett L. Hollis, Office of the General Counsel; Morse Salisbury, Director, Rodney L. Southwick, and Robert Tumbleson, Division of Public and Technical Information Service; and Dr. Walter Colby, Director of Intelligence; all of the United States Atomic Energy Commission.

James W. Parker, president and general manager of Detroit Edison Co.; and chairman of the Industrial Advisory Group, United States Atomic Energy Commission.

Isaac Harter, chairman of the board, Babcock & Wilcox Tube Co.; and member of the Industrial Advisory Group, United States Atomic Energy Commission.

Dr. Lee A. DuBridge, president of California Institute of Technology; and member of the General Advisory Committee, United States Atomic Energy Commission.

Dr. Enrico Fermi, Institute for Nuclear Studies, University of Chicago; and member of the General Advisory Committee, United States Atomic Energy Commission.

The CHAIRMAN. The committee will come to order.

Senator KNOWLAND. Mr. Chairman, I would like to put into the record at this time a letter, which was in answer to an inquiry I raised at the hearing on June 29. It is a letter that was addressed to the chairman and signed for Carroll L. Wilson—I cannot make out the signature; I think it is the signature of Mr. Shugg—dated July 7. It is as follows:

DEAR SENATOR MCMAHON: This will transmit to you the summary salary data requested by Senator Knowland in the hearings on June 29, 1949. This request appears at page 1697 of the stenographic transcript. For the convenience of the committee we have also included a summary of the data previously submitted on employees receiving \$14,000 per year or more.

In connection with the preparation of this information, it was discovered that a change is necessary in the table recently submitted showing contractor per-

sonnel receiving salaries of \$14,000 or more per year. Under General Electric Co. at Hanford on that table, W. R. McKenna and R. C. Stanton are shown as receiving basic salaries of \$11,520 plus bonuses of \$3,440 each. These two employees have recently received salary changes due to a reduction in working hours and now receive basic salaries of \$9,600 instead of \$11,520 as previously reported. For this reason, they have been included in the attached table and it is requested that they be removed from the table that was submitted June 24, 1949.

Sincerely yours—

and it lists a summary of employees of the Atomic Energy Commission and its contractors receiving payment of \$10,000 but less than \$14,000 per year.

It shows in a break-down of contractor employees receiving \$10,000 but less than \$11,000, 73 of them; \$11,000 but less than \$12,000, 24; \$12,000 but less than \$13,000, 36; and \$13,000 but less than \$14,000, 17; or a total of 150 employees receiving between \$10,000 and \$14,000.

On the AEC employees it shows those receiving \$10,000 but less than \$11,000, 87; \$11,000 but less than \$12,000, 10; \$12,000 but less than \$13,000, 5; and \$13,000 but less than \$14,000, 2; or a total of 104.

Then, the break-down on the summary of employees of AEC and its contractors receiving payments of \$14,000 and above per year, that is as follows: \$14,000 but less than \$15,000, 9; \$15,000 but less than \$16,000, 13; \$16,000 but less than \$17,000, 5; \$17,000 but less than \$18,000, none; \$18,000 but less than \$20,000, 3; and \$20,000 and above, 3; for a total of 33.

Of the AEC employees, the previous list I just read was contractor employees, AEC employees, those receiving \$14,000 but less than \$15,000, 9; \$15,000 but less than \$16,000, 5; \$16,000 but less than \$17,000, none; \$17,000 but less than \$18,000, 1; and \$18,000, 3; for a total of 18.

The total number of employees receiving \$10,000 or over, contractor employees, 183; AEC employees, 122.

I ask that that be made a part of the record.

(The data referred to above are marked "Exhibit 31" and will be found in the appendix.)

Senator HICKENLOOPER. Mr. Chairman, before we proceed, if you would indulge me for just a moment, with respect to the discussion about the clearances for the Eniwetok test of last year, and the references to it, I asked for the records again this morning, and I find that in the record of emergency clearances for the month of April 1948 there is a specific notation that—

Clearances under the interim security measures for the armed forces issued May 23, 1947, or for project 19—

which is the Eniwetok test—

are not included; so that the totals of over 4,000 emergency clearances would have to have added to that the Army emergency clearances and the Eniwetok test clearances,

and they were not included in the original figures.

Mr. VOLPE. Mr. Chairman, actually there were two groups of clearances: One, emergency clearances for contractor employees connected with the Commission's phase of this operation, and then there was another group of interim clearances for the armed forces.

I am quite certain that the footnote Senator Hickenlooper makes reference to has to do with the interim clearances or approvals given

by the armed forces and does not include the emergency clearances given by the Commission which, I believe, are included in the total figure of approximately 4,000.

Senator HICKENLOOPER. I just was reading what was put on the Commission's own report, and it says that clearances for project 19 are not included, nor are clearances for the armed forces under the orders issued May 23, 1947, under interim security measures, and that was the——

Mr. VOLPE. It is not terribly clear, I agree, Senator. I would agree that we go back and check our records and submit a statement, because it may very well be that they were not included in that.

Senator HICKENLOOPER. I notice that the interim clearances for April 1948, as reported by the Commission, total 193. I do not find them for May, but they were running on the average of over 100 per month, which would indicate that the Eniwetok clearances were not included.

I merely want that in the record at this time, Mr. Chairman.

The CHAIRMAN. Now, is the Commission ready to proceed?

**STATEMENT OF DAVID E. LILIENTHAL, CHAIRMAN, ACCOMPANIED  
BY JOSEPH VOLPE, JR., GENERAL COUNSEL, BOTH OF THE UNITED  
STATES ATOMIC ENERGY COMMISSION**

Mr. LILIENTHAL. Mr. Chairman and members of the committee, the witnesses this morning are four distinguished citizens of this country, as follows:

Mr. James W. Parker, who is the president and general manager of the Detroit Edison Co., of Detroit, a very well-known engineer, and the administrator of a great utility company, and the past president of the American Society of Mechanical Engineers.

The second witness is Mr. Isaac Harter, the chairman of the board of the Babcock & Wilcox Tube Co., of Beaver Falls, Pa., and who has been in charge of operations of that great company for 45 years, a company, as I recall, which is engaged in the manufacturing of power boilers for industrial, naval, maritime, and other purposes, and in making special grades of steel, steel tubes for chemical and other purposes, special refractories for different kinds of materials, in which the element of development has been a very important factor.

These two gentlemen have been, respectively, the Chairman and member of the Industrial Advisory Group to the Commission, and Mr. Harter, more recently, has become a member of the Patent Compensation Board of the Commission.

The third witness is expected to be Dr. Lee DuBridge, the president of the California Institute of Technology, a distinguished scientist, and a member of the General Advisory Committee to the Commission; and Dr. Enrico Fermi, whom it is about as necessary to describe as Magellan or Copernicus, and who is on the staff of the University of Chicago, and a member of the General Advisory Committee.

I would like to present Mr. Parker first.

The CHAIRMAN. Mr. Parker, I am glad to see you here.

Would you give your full name to the reporter, please?

**STATEMENT OF JAMES W. PARKER, PRESIDENT AND GENERAL  
MANAGER, DETROIT EDISON CO.**

Mr. PARKER. My name is James W. Parker.

Mr. Chairman, you want me to offer my observations?

The CHAIRMAN. I think that would be in point.

As we understand it, Mr. Lilienthal said you are Chairman of the Industrial Advisory Committee and, therefore, we presume you have some knowledge of the operations of the Commission.

Mr. PARKER. That is true.

Previous to my appointment to that Industry Advisory Committee I had naturally been interested in this development because of the implications in my own industry. It was about the intelligent interest that anyone in the light and power industry would take in a new development that might possibly have a profound effect.

That interest was really that, you might say, of an interested observer and amateur. My contacts with the Commission were very casual. I had talked to various scientists who had been engaged on the work, but we were, of course, not dealing in any secret information at that time.

Upon my appointment to this Industrial Advisory Committee, however—

Senator HICKENLOOPER. What date was that, Mr. Parker?

Mr. PARKER. That was in November 1947.

Senator HICKENLOOPER. Thank you.

Mr. PARKER. This group of industrialists who were drawn from quite a wide area of industry, several men from the oil-refinery industry; Mr. Harter, who has been already introduced to you, a manufacturer; others who had been engaged in various manufacturing and businesses, based largely on scientific experience and information. I suppose I was chosen as being typical, we will say, of men in the management of the light and power business.

This group of businessmen was given every facility to see how the Commission's operations were carried on. We made numerous trips—I do not think you are interested in the exact number of them—but during that first 3 months, we made at least six or seven visits to the headquarters of the Commission, to their New York office, to the Oak Ridge Laboratory, Argonne in Chicago, and the Hanford plant in Washington, spending several days at each of these major installations, and then numerous visits and discussions with the Commission and their staff later on, until in May of 1948 we had prepared or had brought our thinking to the point that we wished to discuss it with the Commission. We wanted, before we wrote our final report, to correct any errors of fact, misinterpretations of things that we had seen, because although, as I say, we had made visits to all of these plants, it would be impossible in such a huge undertaking to undertake to know all of the details from direct observation.

We were everywhere met with complete openness; we were introduced to the Commission's contractors, and they were free to tell us everything that they cared to explain, and I am sure the whole impression was that we were being very frankly dealt with, not only by the Commission and staff, but by the contractors working for the Commission.

I suppose you would be interested in the general impression, first, of what seemed to us to be the progress that was being made. It was very obvious that progress was being made, that certain operations, for instance, at Oak Ridge, were being slowed down as being uneconomical, that the more economical process was being further developed and pushed forward.

At Hanford we remarked that the operating difficulties that had been encountered—and very naturally there were operating difficulties in so new an installation in so new a field—those operating difficulties were being understood and being corrected.

All of this visiting and discussion led to the first of the conclusions which we made in our report to the effect that in general we believed that the Commission was making great progress; that they were to be commended on the methods employed, and we rather applauded their policy of placing great reliance upon industrial contractors like the General Electric Co. and the Carbide & Carbon Chemicals Co. and people and organizations of great experience in allied fields.

When I say that we applauded that policy, I must say also that coming from Detroit and having some considerable first-hand observation of the operation of the principle of the industry, the automobile industry, with respect to which feeding plants of that community had converted themselves to an entirely new group of products, and the dependence placed upon that kind of capable business industrial organization by both the Navy and the Army, had greatly impressed me, and realizing the anxiety that the public generally felt for this whole development of the atomic energy field, it was something of a relief to me, at least, and I think to the others on our committee, to find that the Commission was not throwing out the window the greatest asset, in our opinion, that the country possesses, the industrial competence and ingenuity of the American industrial system.

I will put it another way: We, believing that it was necessary that the talents of the American industry be drawn upon continually, if we were to continue to make progress, drawn upon as we are certain they were drawn upon during the period when the Manhattan District was in charge, were somewhat relieved to find that dependence was placed upon that kind of operation.

If the talents of these industrial organizations as teams—and I want to emphasize that, they worked as teams; you cannot take them apart; you cannot take the components out of them and put them into another organization and expect to get the same results—you either take them as a team or you do not use them well—you do not make use of them—it was clear to us that it was very desirable that as many men as possible of competence in the application of scientific experience and data be informed, within the limits of security and safety, of the methods and of the purposes of the Commission.

I do not think I have to emphasize, because it is so obvious that it would not be necessary to emphasize, that we realized always that a great deal of the information dealt with is secret and must be kept so.

But when it comes to matters of organization, of organizing the work so that the Commission's contractors could really exert their abilities and accomplish what they are able and have been able to accomplish, when they are informed and have a free hand, it would be very desirable that they know a good deal of the internal organiza-

tion of the Commission. A great deal of the information that need not be considered secret could be put into their hands. So, we recommended a greater participation; we recommended the formation of a permanent industrial advisory group. We were not looking for jobs. We very promptly discharged ourselves or asked for our discharge when we made our report, but we did think that the Commission would benefit by the continuing advice of a rather large group of industrial men predominantly in executive positions but with training in engineering and scientific work who had come up, in other words, from that kind of a foundation.

Dr. Robert Wilson of the Standard of Indiana is a typical example of the kind of man I speak of, an eminent scientist, but, at the same time, a very competent business manager.

The CHAIRMAN. He was on your committee?

Mr. PARKER. He was on our committee. He would be the type of man who should serve, and in our opinion would have been very useful, would be useful, to the Commission.

We recommended also that from time to time when special problems arose, it would be desirable for the Commission to pick special committees that would serve temporarily and work on specific problems, and then be discharged. That was a practice that they followed from time to time, and we felt they should continue to follow it, and to the best of my knowledge they have, since the making of that report, continued to do so.

Now, there were certain matters of management within the Commission that we recognized as really not in the field of our terms of reference—I believe that is the word—and we were asked to report on the possibility of securing more industrial participation, but we asked the Commission if they would like to have comment on the type of organization that had been set up, with the idea that some changes might conduce to a better participation on the part of industry.

You can well imagine that an awkwardly organized Commission would be something that the outside contractor would find it possibly very difficult to deal with, or rather very difficult to do his best work for.

Now the fact that we had some changes to recommend implies certain criticism, but it was, I believe, the sort of criticism that a consultant might possibly make when he is called in on any engineering or industrial job to advise.

We remarked, for one thing, that the General Manager, in our opinion, had too many officers reporting to him, too many division and department heads reporting to him, and we considered that an almost intolerable burden to place on one man.

Well, it was our experience, as we discussed these matters, and we were continually discussing our observations with the Commission, that they began to make changes faster than we could recommend them. In other words, at one time it seemed almost as if our report would be almost useless because everything that we were about to recommend had already been done. That is a little bit of an exaggeration, it was not quite true; but it is true that after our discussion of our first draft of the report, which was merely our attempt to put our thinking together, and after that discussion with the Commission,

we discovered that they were already making moves quite along the lines of those we were recommending, and before the report was finally turned in, the Commission had made considerable changes in their organization; among others, they had appointed—among other changes that were made—a Deputy General Manager who would take some of the burden off the General Manager.

There was a concentration on division heads of executive responsibility, which we thought should be placed there, a general clarification of responsibilities of the different employees and division heads within the Commission.

Now, these changes were not very dramatic things. You would have to watch the thing very carefully to know that any change had taken place, but nevertheless those changes have taken place.

We made our final report in December, I think—yes, December 1948—and although I have not been in as close contact with the Commission's operations since then, it appears from various appointments that have been made and various new practices that have been adopted that the Commission has been moving along the general line of recommendations of this report.

I will not want to undertake to say whether they might or might not have moved faster, but at least there have been moves, and they have been in that general direction.

I will be glad to answer any questions, if you have any.

The CHAIRMAN. Do you have any questions?

Senator HICKENLOOPER. I do not believe I have any questions of Mr. Parker. I have read your report.

Mr. PARKER. I read it again last night.

Senator HICKENLOOPER. And I am somewhat familiar with the contents.

Mr. PARKER. Yes, sir.

Senator HICKENLOOPER. But I have no questions.

Senator VANDENBERG. No questions.

Senator KNOWLAND. No questions.

The CHAIRMAN. Thank you very much.

Mr. PARKER. You are very welcome indeed.

The CHAIRMAN. Now, Mr. Harter.

#### STATEMENT OF ISAAC HARTER, CHAIRMAN OF THE BOARD, BABCOCK & WILCOX CO.

Mr. HARTER. My name is Isaac Harter.

The CHAIRMAN. You are a member of the Industrial Advisory Committee and you are a member of the firm of Babcock & Wilcox?

Mr. HARTER. Babcock & Wilcox.

Senator HICKENLOOPER. May I ask Mr. Parker one question?

Mr. PARKER. Yes.

Senator HICKENLOOPER. Is your company doing any work for the Commission at this time?

Mr. PARKER. The Commission has, I have just learned, in fact, placed a small research project in one of our plants.

Senator HICKENLOOPER. You are equipped, are you not, to do work for the Commission in certain fields if it were deemed advisable?

Mr. PARKER. This is a very incidental thing—I might say at no profit.

Senator HICKENLOOPER. Yes.

Mr. HARTER. Mr. Parker has given an account of the contact of our committee with the operation of the Commission, so that I need not refer to that particularly, except to say that his viewpoint coincides very much with mine about the work of the Commission and its progress in what we both think are the right directions.

I would like to speak a little about another side of this matter. Great industrial developments have been made, as a rule, things of slow growth. They have begun small, and if well-managed, have prospered and have become large, like a number of the companies now working for the Commission.

In that time they have had an opportunity by trial and error to find what works well and what does not. In the case of the Commission's work they are engaged in probably the most difficult industrial operation that there has ever been. They have entered into it under pressure of time, and they have had to take the military side of the matter and make rapid progress with that. At the same time, they have had to branch into a field which, in some respects, is perhaps more difficult than the military side because it is more complex; and they have the problem of immense size in adequately organizing the personnel, and with methods, and I think, in thinking of their operations and the progress that they are making, we should all be very careful to contrast a period of about  $2\frac{1}{2}$  years in which they have been engaged in their job, with the period of 25 years or 50 years that corporations have had, as for example my own, 50, to grow up, in our case to about a fifth of the size of the operation that the Commission is now having.

The CHAIRMAN. How big?

Mr. HARTER. About a fifth the size of the Commission's operations.

Judged against that background—and I think it is a very important background to have—I, as a member of our committee, and with the contact in that way that I have had with the Commission, feel very strongly that their accomplishment is remarkable.

It is not to be expected that in a rapid operation and in the short time that mistakes will not be made. They are made in all corporations, so far as I am familiar with them, even in spite of their advantage of long training, and the problem of proportion must always be carefully considered: How great are the errors compared with the general magnitude of the operation?

In the discussions that you have had here before your committee, the elements of security, the methods of estimating on operations, and methods of procedure generally, have come in for a good part of the discussion.

I think that you must be very careful in considering all those problems to recognize that too much control of them can do harm as well as good. I do not think—take, for instance, the question of estimates for work—I do not think any corporation ever finds itself where it is within its estimate on work. I do not believe that most corporations feel that it would be a healthy situation if they always were. They would feel, I think, very properly, that the men responsible for the estimates are making them sufficiently large that no trouble of that kind will happen.

In our own group, we aim as far as we possibly can to come to the most correct view of what constitutes the total amount that is most

likely to turn out to be justified when the work is done, and then we add to that sometimes 10 percent, sometimes in risky work even more, to cover the possible contingencies, and if, in a complex thing made up of many elements, they all came out black, we would, I think, feel that something ought to be looked into because the estimating was not upon a correct basis.

In all those things, if too much is made of that side of the matter, there will be inevitably a wrong result instead of a good result. I think that is something that should be thought of in this whole affair, as I have been reading about it as it has gone on.

In looking at the work of the Commission, so far as I have come in contact with it and with its people, I am greatly impressed with the high sense of obligation and duty and the effort with which they are trying to carry out their work.

I do not think that any corporation that I know of has in its standards any better approach to their problems or works any harder at it, and I think, in conclusion of what I am saying, we ought to remember that this is 2½ years old, not 25 years old, and that background, I think, of its accomplishment to date is very fine.

Senator HICKENLOOPER. Just to clarify the record a little, Mr. Harter—

Mr. HARTER. Yes, sir.

Senator HICKENLOOPER. Did the Commission build Los Alamos, or did the Manhattan District build Los Alamos?

Mr. HARTER. The Manhattan District.

Senator HICKENLOOPER. Did the Commission build Oak Ridge, or did the Manhattan District build Oak Ridge?

Mr. HARTER. Up to a certain stage of completion, the Manhattan District.

Senator HICKENLOOPER. Yes, certain facilities have been torn down.

Mr. HARTER. Yes, some parts have been added, but in general it has been built by the Manhattan District.

Senator HICKENLOOPER. Did the Commission build Sandia base or did the Manhattan District build Sandia base?

Mr. HARTER. I think it was in between, if I remember correctly.

Senator HICKENLOOPER. Did the Commission build Hanford, with the exception of one new pile which is in the process of being completed now, or did the Manhattan District build Hanford?

Mr. HARTER. Manhattan District, except for—

Senator HICKENLOOPER. So that this is not an installation or a plant that has been built in the last 2½ years. You do not want to be understood as saying that, do you?

Mr. HARTER. No, but it is not alone just a question of plant; it is a question of what you do with that plant. Those plants were built for military purposes.

Senator HICKENLOOPER. Yes.

Mr. HARTER. The Commission's problems are very much wider.

Senator HICKENLOOPER. Is there any difference in the main purpose of those plants now from that which existed before? Are they still being operated in major degree for military purposes?

Mr. HARTER. I would expect that those who really know the answer to that would say yes to it.

Senator HICKENLOOPER. Yes. In other words, there was a very extensive going concern built during the war, was there not?

Mr. HARTER. Going under war conditions, and under that pressure, and operating and, therefore, successful for that purpose; but not going in the sense of a long-term industrial affair which is, after all, what it is in many of its aspects, has to do if it is to be efficient, and if it is to continue, and I think the main work of the Commission is to take the operations that were in a state of beginning, able to do what they had to do, but to improve them to the point where they should be for economy of operation and for extension of their field of work, and I think in those regards the Commission has had a tremendous task on its hands, and it is that that I speak about in the 2½-year period.

Senator HICKENLOOPER. But what operation is the Commission able to do now that was not done by the Manhattan District?

In other words, the Manhattan District built bombs; the Manhattan District produced isotopes; the Manhattan District set up health surveys and had beginnings of research in biology and things of that kind. I am just wondering what new and different operations are in effect now; some of them have been perfected to some extent.

Mr. HARTER. I think that the whole thing turns upon just that question of perfection to some extent, and there my contacts with the various operations of the Commission lead me to feel that the degree of perfecting is a very great degree. I do not mean it has all been accomplished by any means. It is still a great part which yet remains, but it is a very significant difference to me in what contacts I have had between the state of the matter at the time the Commission took over and what has happened to it in this brief time.

Senator HICKENLOOPER. Did you have any intimate connection with the Manhattan District?

Mr. HARTER. No, sir.

Senator HICKENLOOPER. So, then, you are not in any position to judge what the state of perfection was in the Manhattan District except by hearsay.

Mr. HARTER. No; I beg your pardon, sir. I have an idea of certain processes carried on in a certain manner at the time the Commission took over the work.

Senator HICKENLOOPER. Yes.

Mr. HARTER. And I have some idea of the changes in the most important particulars that have been made in those processes.

Senator HICKENLOOPER. You are aware of the fact—are you not—that after the dropping of the bomb on Hiroshima, the whole Manhattan District went into a quiescent state, awaiting the establishing of a public policy by Congress as to how the matter would be handled?

Mr. HARTER. Oh, yes.

Senator HICKENLOOPER. So it was in what one might say was a semioperating state during that period until the method of operation had been determined by Congress through law in the establishment of whatever type of control Congress would decide to establish.

Mr. HARTER. Yes; I believe a recent witness described it as being "flat on its back."

Senator HICKENLOOPER. Yes. Well, perhaps he did. I think the description was one which could be subject to argument, but the fact is that the plant was there, and it was being held in abeyance in its operations until there was a determination of what the direction of operation would be, and the only purpose of questioning was to try

to probe for a moment your suggestion that this entire plant had been built in the place  $2\frac{1}{2}$  years ago.

Mr. HARTER. I did not mean to give that impression.

Senator HICKENLOOPER. Yes.

Mr. HARTER. But I do want to bring out that what Manhattan finished with was for a single purpose, under great duress, accomplished under those conditions in a remarkable degree, but a very different and insufficient total purpose as against that which the Commission immediately took on as its duty.

Senator HICKENLOOPER. What company do you represent, Mr. Harter?

Mr. HARTER. Babcock & Wilcox Tube Co., a subsidiary of the Babcock & Wilcox Co. For most all my time I was in the former company until 2 years ago, when I retired from that.

Senator HICKENLOOPER. Was your company engaged in the past, or are you presently engaged, in any work for the Commission?

Mr. HARTER. I beg your pardon, sir?

Senator HICKENLOOPER. Has your company engaged in the past, or are you presently engaged, in any work for the Commission?

Mr. HARTER. We are doing some work for the Commission; and, compared with our operations, I suppose, it is a matter of a percent, a half percent, or something of that sort.

Senator HICKENLOOPER. I see. I think that is all, Mr. Chairman.

Senator VANDENBERG. No questions.

Senator KNOWLAND. No questions.

The CHAIRMAN. Thank you very much.

Mr. HOLFIELD. No questions.

The CHAIRMAN. Thank you very much, Mr. Harter.

Mr. HARTER. Thank you very much.

Mr. LILIENTHAL. Dr. DuBridge was not in the hearing room at the time I indicated that he would be one of the witnesses. He is here now and prepared to testify.

He is, as I said, the president of the California Institute of Technology.

The CHAIRMAN. Dr. DuBridge, are you ready?

#### STATEMENT OF DR. LEE A. DuBRIDGE, PRESIDENT, CALIFORNIA INSTITUTE OF TECHNOLOGY

Dr. DuBRIDGE. Yes, sir.

The CHAIRMAN. Doctor, it is nice to see you again.

Dr. DuBRIDGE. It is nice to see you gentlemen. Would you like to have me start with a brief statement of my views on this whole question?

The CHAIRMAN. Yes; I think that would be quite desirable.

Dr. DuBRIDGE. I assume that I have been called because I am a member of the General Advisory Committee and, in particular, because I am the chairman of the Subcommittee on Research of the General Advisory Committee. For that reason I will confine my remarks largely to the Commission's activities in the field of basic research.

I would like, before coming to the Commission's activities, however, to say just a word about the position of basic research in science in this country. In my view, it is a very precarious position. We, as a Nation, are bragging a great deal about our scientific personnel and

our scientific resources; but, as a Nation, we are doing very little about them to strengthen them still further.

The reasons for this situation are a little complicated. During the war the scientists of this country were mobilized into great war laboratories; and, as you all know, they were spectacularly successful in developing new weapons of war such as radar, the proximity fuze, and, of course, the atomic bomb.

As a result, there is a widespread feeling in this country that the only purpose of science is to develop weapons of war and that, therefore, science can be kept on a wartime footing.

Now, both of these assumptions are grossly untrue. The chief goal of science is not to develop weapons of war, but to understand nature. The knowledge of science is, and always has been, primarily used to improve the happiness and welfare of men; nor can science survive or thrive on a wartime footing. Science did not thrive during the past war.

On the contrary, science, as such, was stopped during the war while the scientists devoted themselves to developing weapons of war.

The developing of weapons of war, particularly under the stress of war, is a very different thing from doing scientific research. When the practices and techniques of weapon development are extended to pure science, science is stifled rather than strengthened. And yet it is a tragic fact, which bodes ill for the strength of science in this country, that the only Federal agencies today which are supporting to any large extent the Nation's program of basic science are the agencies whose primary function is a military one, namely, the National Military Establishment and the Atomic Energy Commission.

Now, both of these agencies have done a fine job in the supporting of science; but, since their interests are largely in military weapons, the areas of science they support are those related to military applications, and the methods that they are forced to use in such support derive more largely from the traditions of military development rather than from the traditions of pure science.

Therefore, I want to make, as a fundamental thesis of my remarks, the statement that the support of pure science, with which also goes the education of new scientists, is a totally different task from that of developing weapons of war and must, therefore, be treated on a totally different basis.

Now, to be more specific: I think it is obvious to the members of this committee that a strong base of pure science in this country is essential to national security. We were strong in the last war because we were strong in science. It will be even more important, if there should be another war, to have this strength to count upon.

Science is essential to national security. Nevertheless, when we attempt to extend to pure science the principles of secrecy which go under the name of security rules, we automatically suppress the progress of science. Therefore, secrecy imposed upon basic science is actually inimical to national security. Thus, we have the paradoxical situation that for greatest national security in the field of pure science there must be a minimum of the so-called security regulations.

It is unfortunate that this word "security" and the word "secrecy" have come to be regarded as almost synonymous. In the field of basic science, secrecy and security are neither synonymous nor even com-

patible. Unless these things are clearly understood, we will only have confusion when we discuss the program of the Atomic Energy Commission as it relates to the field of pure science.

May I come down more definitely now to the responsibilities of the Atomic Energy Commission in the field of pure science?

These responsibilities of the Commission are set forth fully in the McMahon Atomic Energy Act of 1946. You will recall that the Atomic Energy Commission was charged with three responsibilities: (1) for the development of atomic energy as a military weapon; (2) for the development of industrial applications of atomic energy; and (3) for the encouragement and support of basic science in fields related to nuclear energy.

I am personally very glad that the Atomic Energy Act does provide that the Commission shall lend its support to the development of pure science. Nevertheless, I am also cognizant that this responsibility is a most difficult one for the Commission to fulfill, because the policies which the Commission can and must adopt in forwarding its other two tasks are very different from the ones that it must adopt in forwarding basic science.

May I review briefly the history of the Commission's activity in the support of basic science?

When the Commission first took office, as you know, the atomic energy enterprise was in a precarious position, following the year and a half of uncertainty between the end of the war and the day the Commissioners finally took office.

The tasks of the Commission at that time, as I see them in order of their priority, were very clear cut; namely, first, the restoration of the bomb-development program at Los Alamos and the placing of this program on a firm foundation.

As other witnesses have already testified to you, this objective has been accomplished with superb success.

The second task of the Commission was to place upon a sounder footing the activities relating to the production of fissionable material. This meant removing the Oak Ridge and Hanford plants from a war-time footing, where speed was the primary consideration and economy and efficiency were secondary, and placing them on a permanent peacetime basis, with due regard to economy, efficiency, and stability.

Now, I am not an expert in the field of production of fissionable materials, but it is my firm conviction, from what I do know, that in this task, too, the Commission has met with great success.

Production facilities have been increased; production has steadily risen, and economy and efficiency have been successfully achieved.

The third task of the Commission was to build up the facilities for the development of atomic energy as a peacetime tool. This means primarily the development of methods for producing atomic power.

The Commission could not give adequate attention to this task until the first two were placed on an adequate footing, but during the past year or more enormous strides have been made in connection with this objective, the strengthening of the atomic power program; and this, too, can now be regarded as on a solid foundation and progressing most satisfactorily.

Fourth, the final task of the Commission, in order of priority—and I am neglecting a number of other tasks which I will not speak

about—was the development of the country's facilities for research in science, in the field of nuclear science and allied fields.

In this area, the task of the Commission was twofold: (1) the development of adequate research programs in the Commission's own laboratories and (2) the development of many centers of research in universities and industry throughout the country.

Naturally, again, the Commission gave first attention to the research program in its own laboratories. I am not speaking here so much of the research at Los Alamos and Argonne and Oak Ridge, research which is incidental to the development of atomic weapons or nuclear power. Much research of this sort is, of course, necessary, and is being pursued on a large scale at those laboratories.

There are, however, two Commission laboratories which are primarily devoted to what we call basic research. These are the Radiation Laboratory of the University of California and the Brookhaven National Laboratory on Long Island. Neither of these laboratories is primarily concerned with atomic weapons or with nuclear power. Both are concerned with strengthening our basic knowledge in nuclear physics, in nuclear chemistry, in radiobiology, in metallurgy, and other fields which are related to nuclear science.

Now, both of these laboratories were actually established by the Manhattan District before the Commission took over, but during the last three years the Commission has been most successful in encouraging the growth of these laboratories so that both are now flourishing and are valuable assets to the country's scientific program.

It is unfortunate, though possibly inevitable, that certain secrecy restrictions have to be imposed on these two laboratories. At neither of them does the work, for the most part, have anything to do with the design or production or use of atomic weapons.

However, at Berkeley, there is some work on the chemistry of fissionable material, and at Brookhaven, one of the chief facilities is a nuclear reactor, whose design is still classified. Practically all the other activity at these two laboratories is unclassified and is freely published and freely discussed, as it must be if these laboratories are to make a contribution to science.

Yet, because of the small amount of classified work, secrecy restrictions must be imposed even at some cost in speed and the effectiveness of the work.

This situation, I say, although unfortunate, is at the present time inevitable. I would, however, like to pay tribute to the Commission for the wisdom it has shown in providing, as far as is possible within security requirements, for the atmosphere of freedom in both of these laboratories, which is most essential to their success.

I would like now to come to the final aspect of the Commission's responsibility in the field of basic research, namely, the stimulation of research throughout the country in fields related to atomic energy.

Science is not strong solely by having one or two large laboratories. Its strength grows from a widespread interest at many centers, by many individuals. Also, science will stay strong only if there is an extended program of training of new scientists. Consequently, the Commission early recognized as a part of its task the stimulation of university centers of research and of teaching in the field of nuclear science.

The General Advisory Committee, of which, as I have said, I am a member, has always had a very keen interest in the Commission's activity in strengthening research at universities. This is partly because many members of our committee are university scientists themselves, and it is partly because the General Advisory Committee is charged under the law with advising the Commission with respect to scientific and technical matters.

University research is an area in which we feel competent to advise. We were quite cognizant of the fact that the Commission was unable to take any strong forward steps toward the encouragement of basic science in universities during the early days when it had more urgent tasks to perform. Even so, we, on the committee, on various occasions, gently, I think, reminded the Commission that sooner or later they must direct themselves to this task. They have now made a number of most important moves in this direction. The first one was to continue and strengthen the program which was initially established by the Manhattan District relating to the distribution of radioactive isotopes manufactured in the reactor at Oak Ridge.

It happens that I was asked by General Groves back in 1945 to serve as chairman of what he called the Interim Advisory Committee on Isotope Distribution, at the time when the program was being established, shortly after the end of the war.

General Groves felt, very wisely I believe, that the Manhattan District could make an important contribution to the development of science in this country by providing recognized scientific laboratories with radioactive isotopes which they needed in their research and which could be supplied from the Oak Ridge Laboratory.

Our Interim Advisory Committee set up a suggested program and a set of suggested policies to be followed in allocating these isotopes, and this program and these policies were adopted by the Manhattan District.

The Interim Committee recognized that in the initial stages the program would need to be a restricted one with only a few isotopes available, and the distribution policies would need to be on an experimental basis. But, as time went on, and as the needs for the isotopes increased and the ability of Oak Ridge to produce them increased, we proposed that the distribution program be gradually expanded, as, of course, it was.

When the Atomic Energy Commission took over, this Interim Advisory Committee was continued for a time, and in line with its recommendations the isotope distribution program was gradually enlarged. Eventually, after the Commission got fully organized, it appointed a permanent committee to advise on this matter, and, because of my own membership on the General Advisory Committee, I withdrew from the isotope advisory group.

As a member of the General Advisory Committee, however, I have followed the isotope distribution program with some interest up to the present time.

As you know, our committee has been asked to advise the Commission on this isotope distribution program, and the position of the General Advisory Committee on this subject has been outlined to you in considerable detail by Dr. Oppenheimer, our chairman. I wish only to add to Dr. Oppenheimer's testimony, that I agree fully with

what he has said, and that I believe the isotope distribution program has been an extremely valuable one and has been, on the whole, very wisely administered, and that it has made a most important contribution to the progress of science.

I believe, also, that the distribution of isotopes abroad was a wise move under the conditions under which the foreign distribution was set up. The knowledge of science knows no national boundaries, and the developments of science in Europe will have just as great a value to us as to any other country; indeed, probably a greater value because we have greater technological facilities for making use of new knowledge that opens up in the field of science.

The distribution of radioactive and, later, of stable isotopes to research laboratories in this country and abroad, then, was the first step which the Commission took toward the strengthening of basic science.

A second step of great importance was taken when the Commission entered into a cooperative agreement with the Office of Naval Research for the joint support of projects in nuclear physics and in biology and medicine.

The Office of Naval Research, as you know, has taken a keen interest in the development of basic science in this country since the war. In recognition of the important role which science played during the war in the development of our military strength and the important role which it will play in any future conflict, the Office of Naval Research has taken that keen interest.

The demands upon the Office of Naval Research, however, were much greater than its budget would allow it to fulfill, and the contribution of the Atomic Energy Commission to this program was of far-reaching value.

A very large share—and this is not often realized—of the basic research in nuclear physics which is now being carried on in the universities of this country is supported by the joint Office of Naval Research-Atomic Energy Commission program.

A third step taken by the Atomic Energy Commission in support of basic science was the direct support, through contracts of its own rather than the Office of Naval Research, of university research projects.

I personally believe that the Atomic Energy Commission would have been wise to have initiated this program of direct support at an earlier date than it actually did. However, I also understand the reasons why this was impractical in view of more urgent tasks.

Fortunately, the cooperative program with ONR enabled the Atomic Energy Commission to get its feet wet in this field while it was setting up for itself a suitable administrative organization to handle the problem more directly.

I believe that the Atomic Energy Commission's direct support of research projects in nuclear physics, in nuclear chemistry, radiobiology, and other fields is of very great interest to this country for the following reasons: (1) These activities, these research activities, greatly need more financial support than the universities themselves are able to give. The university budgets are hard pressed because of rising costs in every area, and research in many of these fields requires expensive facilities which the universities themselves cannot afford; (2) a strong program in these fields is important to national

welfare, and it is appropriate that an agency of the Federal Government should take responsibility for encouraging progress in these areas; (3) the atomic energy program itself, because it depends heavily on science and technology in many areas, greatly needed the support of and the contacts with basic science. In the long run, progress in the atomic energy field will depend very critically on the basic research program of the country and the new knowledge which this program will uncover; (4) it is wrong for the sole Federal support of basic science to come from a military agency, even one such as the Office of Naval Research, which has shown exceptional wisdom in administering its program.

The CHAIRMAN. Who is the director of that?

Dr. DuBRIDGE. The Office of Naval Research is now headed by Admiral Solberg, and the scientific director is Dr. Alan T. Waterman, and they have quite a capable scientific staff in various fields to assist them.

Universities and scientists feel more comfortable in having also a civilian agency with which to work and which can lend support, such as the Atomic Energy Commission.

Finally, the Atomic Energy Commission is specifically charged with the encouragement of basic science in the Atomic Energy Act of 1946. I firmly believe that one of the best investments the Federal Government could make would be to allow in the Atomic Energy Commission budget a sum of not less than \$25,000,000 a year for the direct support of university programs in basic science in fields related to the Commission's responsibilities.

A final step taken by the Commission in fulfilling its responsibilities for the support of science was in the establishment of the National Research Council fellowship program. With this program, of course, you are all familiar.

I wonder, however, if you are familiar with the long history of the National Research Council's fellowships. As you know, these were first established through a grant by the Rockefeller Foundation back in the early 1920's, and at that time the National Research Council picked the most promising of the young Ph. D.'s in science each year and provided them with stipends in research funds which they needed to continue their studies at a research center in this country or in Europe.

A very large share of the leading active scientists of today got their start through National Research Council fellowships. For example, Dr. Oppenheimer was a National Research fellow in 1927 and 1928. Dr. Ernest Lawrence of the University of California was a National Research Council fellow from 1925 to 1927. Dr. H. D. Smyth, now a member of the Atomic Energy Commission, was a National Research Council fellow from 1921 to 1924, and I am glad to admit that I am prejudiced in this matter, since I, also, was a National Research Council fellow from 1926 to 1928.

Mr. HOLIFIELD. Dr. DuBridge, may I interrupt you there?

Dr. DuBRIDGE. Surely.

Mr. HOLIFIELD. We have had, as you know, quite a sensational situation develop among these fellows in regard to the granting of a fellowship by the National Research Council to one Hans Freistadt.

Dr. DuBRIDGE. Yes, sir.

Mr. HOLIFIELD. Who was an open and avowed Communist.

We have had under consideration, of course, the wisdom of extending this service which the Atomic Energy Commission has been able to extend through this National Research Council to these boys, giving them this opportunity, and the wisdom of continuing this has been quite sharply questioned in view of the fact that we are, in effect, in the case of Freistadt, in his case, for instance, expending taxpayer's money to people who are not in accord with our form of government and are in sharp discord with it, you might say.

The question I wish to address to you is this: Do you believe that it is possible for the Atomic Energy Commission to continue the fellowships in the field of nonsecret research, basic research, without the onus that will come upon the Commission's work as a whole in cases that develop such as the Freistadt case?

Dr. DuBRIDGE. I think the National Research Council fellowship program is a most important part of the Commission's activities. I think it would be most unfortunate to the Commission and to the country if this fellowship program should be abandoned.

Mr. HOLIFIELD. You are speaking of the field of nonsecret research?

Dr. DuBRIDGE. Exactly.

Mr. HOLIFIELD. Of course, in the secret field now we require the FBI clearances.

Dr. DuBRIDGE. That is right.

Mr. HOLIFIELD. Now, about the FBI clearances in the nonsecret fields.

Dr. DuBRIDGE. I will restrict my remarks to the education of scientists in fields which are not secret.

Mr. HOLIFIELD. Yes.

Dr. DuBRIDGE. To place restrictions on the choice of fellows in those fields, restrictions which would adversely affect the research-fellowship program I think would be a very bad thing for the country and a very bad thing for science.

To answer your question specifically, I think that the initiation of an FBI investigation for all of these youngsters, students, who are being considered for fellowships would be a very bad thing for the country. To extend secret investigations by the FBI to students, undergraduate and graduate, throughout the country, inquiring among their young friends and relatives about their political beliefs, associations, and affiliations would be a very disrupting influence.

It would bring the basic ideas of a police state into American youth. I think this would be a very unfortunate thing, not only to the fellowship program itself, but for the country as a whole.

Mr. HOLIFIELD. You think that the calculated risk that we would be taking in educating an individual who might eventually be disloyal to the country would be justified in relation to the amount of good that would be accomplished by the hundreds of young men who could enter the field of basic research and receive assistance, that the good which would be accomplished would far outweigh the small percentage of bad that would occur in isolated cases such as the Freistadt case?

Dr. DuBRIDGE. I firmly believe that. If it is Government money you are worried about, it would cost thousands of times as much to investigate everybody as to pay a few hundreds to a few Communists, even if they did get in. But it is not the matter of money so much, I

think, as the principle of the thing; and to extend political investigations to young students working in nonsecret fields where there is no question of national security involved at all I think is contrary to American principles of democracy, and we should not enter into it. We should take this small calculated risk.

Mr. HOLIFIELD. You have no objection to the loyalty oaths that are required, do you?

Dr. DuBRIDGE. I have no objection to it, except insofar as it might be a first step toward going further. I think the loyalty oath is a piece of paper which has very little meaning. It will eliminate an occasional naive youngster who is quite willing to admit he is a Communist and still think he can be loyal to this country.

It will not eliminate the really dangerous, subversive Communists, who are quite willing to perjure themselves if they think it to their advantage to do so.

Therefore, we will soon find the loyalty oath is not eliminating the possibility, at least, of having subversive Communists apply and possibly receive these fellowships. So it will be reasonable to say: Shall we not go a step further? And a step further will be made and that, in turn, will be found to be inadequate, and pretty soon we will have the whole FBI machinery investigating these youngsters again.

So what I am afraid of—while I oppose communism and do not like to see Communists in the fellowship program, I am still more afraid of the methods which would have to be adopted to prevent this. There will only be occasional ones, and I think the methods which would have to be adopted in order to prevent this are far more dangerous than the small risk of having an occasional Communist on the fellowship rolls.

Mr. HOLIFIELD. You know that the public is somewhat confused as to the differentiation between the nonsecret and the really vital secret work, and it is hard, I think, to get to the people the real differentiation between those two programs of study. Therefore, it seems to me that this field of nonsecret research, while I am heartily in favor of it and I believe it could be carried on personally in the manner in which it has been carried on, but it seems like because of the explosive public opinion, which is attached to anything having to do with the atomic energy program, it might be necessary to disassociate that field of research from the Atomic Energy Commission and place it, for instance, in a National Science Foundation, which we hope to establish.

Strictly from the standpoint of yielding with the gale of misunderstanding, which is abroad in the land, and the hysteria which is abroad in the land, not from really a logical standpoint, that is.

Dr. DuBRIDGE. I certainly hope that the National Science Foundation will be promptly established. When there is such a foundation to provide fellowships and to provide support for the basic research in all fields of science, that will relieve some of our problems. However, I think for us to retreat in the face of a public misunderstanding from a most valuable program, which is most appropriate and indeed very important for the Atomic Energy Commission to pursue, I think to retreat from that program in the face of public misunderstanding would be unwise. I would rather try to correct the public misunderstanding and make it clear to the public, if we can, that 99 percent of the so-called field of atomic science is just as nonsecret as biology

or medicine or agriculture or metallurgy or seismology or what have you, and there are no more reasons for extending into this vast non-secret area of atomic physics secrecy and security regulations than there is to extend them into the field of biology, medicine, agriculture, and these other fields.

I think it is worth while to make an effort to make the public understand that and to bring this point out sharply in our discussions, so that when the Commission is operating in these nonsecret fields, it has the same policies that are always adopted in the encouragement of science in nonsecret fields. When it is operating in secret fields, it adopts the policies appropriate to secret work.

Mr. HOLIFIELD. Notwithstanding the technical approval which the Commission exercises and must exercise in the approving of these fellows, it is true that the real responsibility lies among the Board of the National Research Council, and it is true that they are following practices and procedures which they have followed for years in selecting these brilliant young men for special training.

Dr. DuBRIDGE. That is right. And that set of policies and procedures which the National Research Council has followed for nearly 30 years now has proven its value by its results. As I have said, a large share of our scientific strength at this moment in this country has been built up through these National Research Council fellowships. I think it is wise to continue and expand them because we need them even more today than we did in 1925.

Mr. HOLIFIELD. It is perfectly possible that if some of these brilliant men that have been educated in these fellowships, if their political and economic views should have been questioned in the days when they were immature, struggling young scholars, that they may have been eliminated by a rigid loyalty questionnaire program.

Dr. DuBRIDGE. It is perfectly possible, and it is very fortunate that such inquiries were not made at that time. You never can tell where brains will arise. They may arise in association with very curious political ideas, but brains are a national asset, and we should encourage them and support them wherever they are found.

I do not like also, as I think a previous witness indicated, the idea that we are doing a favor to these fellowship candidates by giving them a fellowship. We are doing a favor to the country by developing their skills and their brains in the field of science. The country needs those brains and the country is getting a good bargain in spending money to train these men who will be important in the future leadership of science.

Mr. HOLIFIELD. One relatively small scientific discovery by one of these young men in actual monetary value would far outweigh the cost of the program?

Dr. DuBRIDGE. Precisely.

Senator MILLIKIN. I would like to suggest to the doctor that as to whether or not the investment is well made depends on how the young men turns out and how he turns out may have some relationship to his viewpoint.

I would like to suggest also that there is no right in any citizen of the United States to have a fellowship. I wish to take sharp issue with you on that. There is no right in anyone to have a fellowship.

The United States, which spends the money, has the right to set the standards by which those men will be chosen. The people of the

United States may be very wrong and they may be misinformed, as has been suggested, but they have the notion, for which considerable support can be developed, that the United States should not be spending the taxpayers' money to educate anyone who joins a conspiracy against the United States. Now, that is a sort of grass-roots notion, it may not appeal to straight logicians, it may have some defects under some sophisticated philosophy, but the average fellow in the United States has the notion that the taxpayers' money should not be spent to educate people who are in a conspiracy against the United States.

Now, then, in spending that money—and since that is the basic feeling, and I share that feeling—since that is the feeling, we are entitled to take those steps which are necessary to eliminate the youthful, the middle-aged, or the aged conspirators. It is just that simple.

Now, maybe the Communist oath will not do it. I am inclined to agree with you that if a man is a Communist, a real Communist, he does not pay any attention to the oath; but certain people are finding that the crime of perjury has certain perils to it, and it may act as a deterrent, which is a useful thing when you are trying to keep bad people out of any service. It builds up some of the odds against the ease with which people can join these services for conspiracy purposes.

Now, I am curious about the FBI business. I have no opinion on whether there should be an FBI investigation, but let me ask you bluntly: What is wrong with an FBI investigation so far as this particular purpose is concerned? That is, of determining who we want to have in the fellowships.

And in that connection, Doctor, I remind you we are not engaged in a shotgun educational process; we are giving these fellowships to men who work in nonsecret fields preparatory to the secret field. We are not just educating scientists on a shotgun basis. We are educating these fellows to prepare them for secret work.

Of course, we all hope by the time they are educated we will no longer have the menace of war and that there will be no occasion for secrecy, but until we get rid of that, we have to govern ourselves accordingly.

What do you have to say about that?

Dr. DuBRIDGE. You brought up two or three points.

Senator MILLIKIN. Take them one at a time.

Dr. DuBRIDGE. You say that the purpose of this program is to educate scientists for secret work. That was not my understanding of the purpose of the program.

Senator MILLIKIN. I suggest to you, Doctor, that it follows just from a statement of the matter that the Atomic Energy Commission has no authority to engage in general educational campaigns for the aid of science.

Dr. DuBRIDGE. But it is charged with the encouragement and support of basic science, and with the stimulation of training of scientists in fields related to the field of atomic energy.

Now, as I have just said—

Senator MILLIKIN. If I may interrupt, I would suggest that is a pretty big tent. I suggest any part of the general field of science has some relation to the field of atomic energy. The business of the Atomic Energy Commission is to concern itself with atomic energy.

We cannot sophisticate that off into thirty-second-cousin activities. The purpose is to educate men who will be useful in the field of atomic energy, not other fields, not too distantly related fields.

Keeping that in mind, the purpose obviously is to educate men in nonsecret work with the ultimate idea that if secrecy is then necessary, that they will be available for secret work.

What is the use, then, if that be true, of being careless about the kind of fellows that you bring into nonsecret work?

Dr. DuBRIDGE. I think the basic purpose of the fellowship program probably is the real question that is before us. As I said, I did not understand that the sole purpose was to educate men for secret work, but a part of the purpose was to educate men to strengthen those fields of science which have some relation to atomic energy and which are not now and may never be secret fields.

One can never predict in what field of science a result of very great importance to atomic energy may arise.

Senator MILLIKIN. And one cannot predict, Doctor, which one of these fellows you might want to put into secret work.

Dr. DuBRIDGE. That is right. When he goes into secret work, obviously, you must then clear him. There is no question, I think, about that.

But it seems to me that carrying out the clearance during his student days is unnecessary and undesirable.

Senator MILLIKIN. Let me get it down to brass tacks. Why spend the money on someone who might not be cleared when the day of clearance comes?

Dr. DuBRIDGE. Would you rather spend a hundred thousand dollars in clearing everybody than spend \$1,000 in a stipend to one?

Senator MILLIKIN. I would rather spend a hundred thousand dollars or several times a hundred thousand dollars to keep any conspirator against the United States Government out of the field of atomic energy. Put your own dollar sign on it. Write your own check on that.

Dr. DuBRIDGE. I would agree if you are talking about the secret fields of atomic energy, that we should spend any amount of money to keep subversive influences and disloyal influences out of those fields, but I think it is very difficult to initiate a program which is guaranteed to keep them out of any field, nonsecret field, which is within the scope of the Atomic Energy Commission's activities as set forth in the law.

Senator MILLIKIN. Now, let us take the FBI investigation. Those who object to the FBI investigation in most instances do not object to the oaths. There is a certain inconsistency there, but we will pass that.

Now, you tell me what is wrong with the FBI investigation. I would like to have someone make an intelligent comment on it. You said awhile ago that it introduces the police state into the life of the young men. Doctor, it might be better to introduce a police state into the life of some of these young men than to have a police state introduced to the whole United States.

Dr. DuBRIDGE. The FBI investigation, as you know, involves a secret inquiry among friends, relatives, associates, about an individual's political beliefs, his political activities, all of this must be done on a secret basis. The men and women who make statements about the candidate remain anonymous. They can make statements without being under oath, without being known to the candidate, and while

all of this may be necessary in clearing people for secret work, I just do not think that this is a part of the American democracy in non-secret fields in education or in any other activities that have nothing to do with national security as such.

Senator MILLIKIN. If the secret fields were not connected with the nonsecret fields, I would gladly and quickly agree with you.

Dr. DuBRIDGE. Then the question boils down to how you are going to separate the nonsecret fields from the secret fields. I judge what you mean, therefore, is that the areas which the Commission is charged under the law with supporting must be connected with the secret field. But there is an enormous amount of work in areas related to biology and medicine and nuclear physics, to chemistry, and so on, which the Commission is charged with supporting under the law, which has either immediate or remote connection to a secret area.

Furthermore, there are other areas of science whose connection to atomic energy we may not even know about. As soon as you start getting outside the secret fields at all and say that because there is a connection, we must extend the FBI clearance, pretty soon you have the whole field of science and education under it.

Senator MILLIKIN. Let us assume that the student is not preparing himself for a secret field. Let us assume we could tell in advance that this particular fellow will not be in a secret field. I still suggest to you that the American people might not want to give a fellowship to a fellow who joins a conspiracy against his country to work in a nonsecret field. They might not want him to have a fellowship.

As long as they are spending their own money, they have the choice of the kind of fellows they want to educate.

Dr. DuBRIDGE. I realize there is this feeling. I think it is an unfortunate feeling, not because I do not share in a sense the distaste for giving money to a man who is a member of the Communist Party, but I think that the methods that must be adopted to be sure we prevent that are far more dangerous and more distasteful than having an occasional Communist receive a Government stipend.

Do you know how many Communists receive Government stipends through the GI scholarship program? I do not, and we did not inquire. Mr. Freistadt did receive a GI scholarship. As far as I know, nobody complained at that time or even complains now about that fact.

Senator HICKENLOOPER. That is a different philosophy entirely.

Dr. DuBRIDGE. That is giving Government money to a Communist, which is what we are talking about.

Senator HICKENLOOPER. The GI educational bill is based on the theory of an earned stipend. It is the payment for something that has been earned prior to that time.

Dr. DuBRIDGE. I would think a national research fellowship is also an earned stipend, based upon the fact that the man has brains and ability of value to this country and it is to this country's interest to educate him. He has earned this education by his ability, as proven in his previous work, and he is doing a service to the country by training himself.

Senator MILLIKIN. There, Doctor, we have a clean-cut issue.

Dr. DuBRIDGE. I think that is where the issue arises.

Senator MILLIKIN. He has not earned it until he has earned it, and it depends on what kind of a bird this fledgling becomes after he gets

over the pinfeather stage and develops his wings and starts to fly. Then we can say he has earned it. We cannot say it before, I suggest.

Dr. DuBRIDGE. It is a question of the definition of "earning." When we find bright young fellows in the country and educate them for the national welfare, it seems they are on the same basis as the GI scholarship.

Senator MILLIKIN. I think Senator Hickenlooper has demonstrated the fallacy of that distinction. But, in addition to that, there is still another fallacy, and that is the inescapable part of this discussion—that we are dealing in the field of atomic energy and that we were not giving GI scholarships to deal necessarily in the field of atomic energy.

Now, what is wrong, what is this harmful thing resulting from the FBI investigation, which becomes all right when the man starts to enter secret work but is not all right when he is in nonsecret work preparing possibly for secret work?

Dr. DuBRIDGE. Simply that the secret areas of science are very small, a tiny fraction of the whole area of science; and if the blanket of clearances and security regulations and secrecy, which need to be imposed on the secret areas, are extended to the whole area of science, you are going to have a very big blanket, indeed.

Senator MILLIKIN. The whole area of science will not be covered by those who get fellowships.

Dr. DuBRIDGE. You have already suggested that the National Science Foundation fellowships, for example, would be giving Government money to Communists unless there is an FBI investigation.

Senator MILLIKIN. I did not suggest that.

Dr. DuBRIDGE. It was suggested in a previous discussion. As soon as you say that even in nonsecret fields FBI clearance must be essential if it is a Government fellowship, then you find that Public Health scholarships, National Science Foundation scholarships, Agriculture Department scholarships, would have to come under the same regulation, and I do not like to see that blanket extended beyond the secret field.

Senator MILLIKIN. I do not like to see it, either. I do not like to see it in this field. I hope the day will come when we do not need secrecy at all; whereupon we will all be more happy. But in this field of atomic energy, where we are training men for nonsecret work to start with and possibly secret work thereafter or in ramified related subjects, I would like to have your reason why there should not be an FBI investigation in terms of the damage that such an investigation does, if you please, to science, or, if you please, to the young man.

Dr. DuBRIDGE. The damage which it does is the damage not only to the individual, but to the country in extending FBI secret investigations to a large area of American life and, particularly, to American youth.

Senator MILLIKIN. How large would that area be?

Dr. DuBRIDGE. There are now 500 National Research Council fellows, I think, in actual residence at universities.

Senator MILLIKIN. Do you call that a large segment of American life?

Dr. DuBRIDGE. There have been hundreds of others who have applied.

Senator MILLIKIN. Would it be a large segment of American life?

Dr. DuBRIDGE. Yes; a very large segment.

Senator MILLIKIN. What is the figure? You are a mathematician, and I want to get your idea of mathematics. Put your top figure on the number that would be involved.

Dr. DuBRIDGE. You are speaking now of only those who would be involved in the Atomic Energy Commission activities?

Senator MILLIKIN. That is right.

Dr. DuBRIDGE. I assume that there would be possibly a thousand a year.

Senator MILLIKIN. Call it a thousand a year. We have almost 150,000,000 people in the United States. Do you call that a large segment of American life?

Dr. DuBRIDGE. It is a fairly large segment, since it includes many universities throughout the country, in all parts of the country; it includes not only the applicants, but their friends and their associates who will be interviewed by the FBI.

Senator MILLIKIN. Multiply it, Doctor, by five and you still would not have a large segment of American life. There is a considerable segment of American life that is not involved in scientific matters.

Dr. DuBRIDGE. That is true.

Senator MILLIKIN. And they are the producers who produce the money that enables us to carry on this scientific program. They are interested in this business. You had better give some attention to them.

Dr. DuBRIDGE. I have given very careful attention, and I think the investigation and the interviewing of thousands of American students at universities throughout the country—I think it is a large enough segment of the youth of this country to give us cause for worry.

I would not like to see secret investigations extended so widely when it is dealing with nonsecret work, because that opens the door to extending it still more widely.

Senator MILLIKIN. Doctor, you have extended it argumentatively. I have not extended it. I am talking about atomic energy.

Dr. DuBRIDGE. That is true, but the same arguments you give would then later be used for further extension, and I am trying to dig a trench right here.

Senator MILLIKIN. Let me suggest, Doctor, you let us worry about that when the first extension develops. We are talking here, this inquiry concerns itself with atomic energy. I think all of us are aware of the implications of secret investigations. We do not want any more of it than is considered to be necessary.

I am trying to develop from you: How is this young man harmed by an investigation that will determine whether or not he has joined up with something that represents a conspiracy against this country?

Dr. DuBRIDGE. The harm comes from the very considerable number of perfectly honest and loyal men who will be disqualified on evidence which is quite inconclusive and possibly even wrong.

Now, during the war I saw many people, honest and loyal men, disqualified for employment in war programs on misunderstandings, on incomplete information, on misunderstood information, on all sorts and kinds of information, some of which might be true and some of which the truth could not be verified. There will be a large number

of perfectly loyal and able young Americans who will be disqualified. That will be a very serious matter to them.

Senator MILLIKIN. This inquiry indicates that the Commission is not harsh in judging these FBI files. The Commission will evaluate the FBI files. Therefore, the responsibility will be in the Commission's hands, and one of the criticisms—and I am not passing on it at all—in this hearing is that the Commission has not been harsh, that it has been excessively liberal in this clearance.

So when you have considered that fact, together with the very small number of those who might be subjected to suspicion, you are dealing with a very small segment of American life. That does not mean that that small segment should be persecuted, that it should be denied any rights it has. I am quite a crank on that subject. But it is a small problem in relation to an enormously important subject.

Dr. DuBRIDGE. But all big things have small beginnings. I am afraid of the results.

Senator MILLIKIN. Let Congress worry about the ramifications.

Dr. DuBRIDGE. I hope they will.

Senator MILLIKIN. I suggest we keep our minds on the purpose of this inquiry.

Dr. DuBRIDGE. Yes. I think there is a clear difference in point of view here, and I do not know whether I can say anything more to clear it up.

Senator MILLIKIN. I hoped that you would convert me, Doctor.

Mr. HOLIFIELD. Dr. DuBridge, the part with which I am concerned, along the line of your reasoning, is that there is a great area of science which is nonsecret, in which discoveries can be made without any danger at all to the Nation in any way, but those discoveries that are made in the nonsecret field might become very valuable in application in the secret field.

Dr. DuBRIDGE. That is right.

Mr. HOLIFIELD. And if you stultify the nonsecret field, then you preclude to a certain extent the possibility of making tremendously important scientific discoveries, say, in the field of chemistry or metallurgy, which are in the nonsecret field as far as those two sciences are concerned, but the application of that discovery in the construction of machinery, in the construction of the mechanism of the bomb later on might prove of inestimable benefit in the secret field.

I think that is the part that is unclear in the minds of the people, that there is this tremendous area where important discoveries can be made for the benefit of the 150,000,000 people, but also which might have a very direct application in the science of atomic energy for weapons.

Is that not true?

Dr. DuBRIDGE. I agree with you completely. I think that is one reason why it is the Commission's responsibility to encourage the development of these nonsecret fields. You cannot tell where an important discovery will arise.

Furthermore, the Commission's own strength for the future will be undermined when these FBI investigations come in, if they do, because an individual, a bright individual, who might have an interest in nuclear physics, when he finds that as soon as he gets into that

field, he is going to be investigated by the FBI, he is going to be regarded as a dangerous character, he will simply say, "Why should I bother to go into that field? There are other fields of science."

So that the field of nuclear physics might be weakened by diverting the best brains of the country to other fields which might not be so critical to national welfare. As a matter of purely self-concern for the national welfare, we ought to encourage the best brains to go into this.

Mr. HOLIFIELD. On the mathematics, the relation of the thousand students to the 150,000,000 people, I submit that is a clear misapplication of logistics. The application, it seems to me, should be the thousand young men to the number of people engaged in scientific research.

Dr. DuBRIDGE. Right.

Mr. HOLIFIELD. That is the comparison, the legitimate comparison. Now, if the figure of the thousand young men is 10 percent or 5 percent of those engaged in basic research, then that is your comparison with which we are concerned.

Dr. DuBRIDGE. That is right.

Mr. HOLIFIELD. It might be interesting to bring up at this point that already this thing is spreading and in the House an attempt is being made now to write this thing into the National Science Foundation bill. How far it will go on the floor of the House by some hysterical Member, I do not know. He may demand a complete FBI investigation of every individual who participates in the National Science Foundation, a complete FBI clearance.

The danger of the spread, as you have pointed out, is the thing with which we are concerned.

Dr. DuBRIDGE. I think that is cause for very deep concern. This would be an opening wedge. Every disaster has started in a small way.

If you look at the early days of the Nazi regime in Germany, some of their earliest activities seemed relatively harmless at the time, but they were the opening wedge.

Mr. HOLIFIELD. They eliminated the Society of Masons in Germany and then the labor unions. They went from one thing to another and finally liquidated everyone who opposed nazism.

Dr. DuBRIDGE. That is right.

Senator HICKENLOOPER. I might suggest to Dr. DuBridge that what he has just said is extremely significant. They do start in a little way, and it is the infiltration of those who conspire against the United States who start in a small way and who are brushed off with an indifference and the statement that their belief in communism is not inimical to the general broad picture of the United States—it is that very thing of infiltration that lays the basis for the success of the conspiracy later.

Dr. DuBRIDGE. That is perfectly right, Senator Hickenlooper, and I did not suggest that the FBI should reduce in any way its activities for getting after subversive Communists wherever they are found. It should trace down Communist organizations; it should bring to the light those who are engaged in subversive activities. That is a job which the FBI should be continually pursuing.

Senator HICKENLOOPER. When they do, there is a very vocal segment in this country which begins to pooh-pooh and belittle the FBI's

investigation, that begins to resist them, that begins to defend these subversives who are uncovered, and, unfortunately, we are too apathetic about it, in my judgment.

Dr. DuBRIDGE. I do not defend that point of view.

Senator HICKENLOOPER. I am not suggesting that to you as an individual at all. I want to make that clear.

Dr. DuBRIDGE. When proof is brought out by the FBI about subversive activities, I think all normal legal channels for punishment or elimination of such dangerous individuals should be found, but I am saying, to find such individuals in the student field, the field of fellowships, involves the bringing in of an FBI investigation in a sweeping way, which I think is dangerous to American democracy.

Senator HICKENLOOPER. I may say this, Doctor, as I have repeatedly said: I have favored the fellowship program, and I still favor the fellowship program, of the Atomic Energy Commission. It is the administration and the methods of selectivity that I oppose; and, also, I was surprised to learn that they were going into all fields of basic science, which was not my understanding of the justification for the fellowship program.

It was my early understanding that the justification for the fellowship program of the Commission was to educate likely young scientists who would form a reservoir which eventually can be dipped into from time to time as the need arose to further the vital things of atomic energy.

There I have disagreed—that is my understanding—from what apparently now is the policy. But I shall not support the elimination of the fellowship program from the Atomic Energy Commission's activities. I believe in it, and I think it should be operated. It is the selectivity and perhaps the scope that I have been somewhat confused about.

Now, I would like to ask you this: There are various types of science. We have laid great emphasis on the physical and the exact sciences here, but I am wondering if there is not a greater science.

Dr. DuBRIDGE. If there is not what?

Senator HICKENLOOPER. I am wondering if there is not a greater science from the standpoint of immediate importance than all of the rest of them, and if that is not the science of government.

In other words, government can close every laboratory in the United States or in the world. It has closed the laboratories to free thought and free investigation in other places. Government can close the doors of every church and religious and moral institution in this land if it gets out of hand.

The science of government, while it may go wobbling down the road, first to the right and then to the left in various ways, nevertheless, the science of government is the thing that keeps the laboratories open and free and keeps research available for the advancement of people.

Now, in our Government we do not believe in nurturing people in the Government activities who conspire to destroy the very system that we want to keep alive. It would seem to me that in science there would be a similar resistance among the scientific people themselves to the nurturing of people whose conspiratorial attitude is to destroy the very free system which keeps their laboratories open.

Dr. DuBRIDGE. That is right, and there is.

Senator HICKENLOOPER. I believe there is. I have said repeatedly that scientists have done perhaps as patriotic and grand a job as has ever been done by any group so far as their contribution is concerned, but I cannot defend any philosophy that opposes the greatest reasonable selectivity of people who go into science in order to keep out of that field—that is, at Government expense—people who, as Senator Millikin said, are members of a conspiracy, which will not necessarily destroy science as such, but will destroy the system that keeps science free.

It would seem to me that that is a very important thing in our attitude toward beliefs of this kind.

Dr. DuBRIDGE. I hope you do not feel that any statements which have been made by scientists or by myself on the question in regard to this FBI clearance is in any way an attempt to defend Communists or defend communism as such or defend subversive activities of any sort. None of us wish to defend those things.

We believe there are mechanisms in our Government for hunting out offenders and taking proper methods of punishment or elimination of them from this country, the elimination of such offenders, but we feel hysteria caused by a fear of Communists in this country can introduce into our own democracy some of the very things we do fear in communism, namely, the police-state methods, the review of political opinions, the purge of scientists and the purge of other people, too, on the basis of political ideas.

How many of these people who are said to be Communists or fellow travelers—and incidentally, the terms are not very clearly defined—simply have a sort of political feeling usually on the basis of youthful naivete that here is something new they wish to explore because it has some attractive features?

They will get into it and get sick of it in a couple of years and be out of it and be better and more loyal American citizens perhaps as a result of their practical introduction to communism and the Communist conspiracy. It is not as though these people are permanently tied up and are forever subversive citizens. They may not be. If they are, they should be investigated by the FBI, and they should be brought through the normal legal procedures for necessary punishment for any illegal or subversive action. But let's not extend police-state methods to a large section of American life in the hysterical fear that one or two such fellows are going to overthrow the country. I do not think they will.

Senator HICKENLOOPER. I think that minimizes the problem considerably, and probably minimizes the entire pattern of Communist infiltration.

But there is another matter that I want to mention. I think the chairman has to leave very shortly, and I want to hurry along.

There is the suggestion that the only people who will make discoveries—I do not mean to say it has been made flatly that way, but the idea that the only people who will make great discoveries in this field are those against whom some background information is bad. It seems to me that out of the 500 young men—and that is infinitely more than the Rockefeller Foundation and all of the rest of the foundations put together have been able to place in the last few years, anyway—it seems to me that in those there is a comparatively small hand-

ful of people, I would say a very, very small number, indeed, who might be questionable.

But I also suggest this to you: That every time some person with a questionable background is given a fellowship some other young American against whom there is nothing is precluded from having a fellowship.

So far as the investigations we have had on the background, let us say of the Freistadt case which has been mentioned here, we find that he was not an exceptional student. He was a brilliant man, but he was not at the top of his class. He was down somewhat. One professor rated him among the top 10 percent; another said in the top 25 percent of this group, indicating that he was not an exceptional or a unique student at all.

But it would seem to me that the occasional elimination of some person, even with the chance that he might at some later date develop an unforeseen brilliance and stumble across some magnificent new law of nature, even at that risk, we could well afford to look into his background pretty carefully.

Now, whether that would take an FBI investigation or not, I do not know. So far as I am concerned, I would have no objection to the FBI investigation, and I would think that the overwhelming number would have none if their backgrounds are clear on their general over-all political beliefs. But I do think that the science of government, which is always in danger of infiltration, the science of government has to be kept as clean as possible, as well as the liberality and the freedom of the more exact sciences.

Dr. DuBRIDGE. I certainly believe that, and I believe one way the science of government can maintain the kind of government and the kind of life that we have is to keep its fingers as much as possible out of nonsecret areas when national security is not involved.

The purpose of our Government is to maintain a free society, and one of the important aspects of the science of government is the ways by which that free society can best be maintained.

Senator HICKENLOOPER. But one of the obligations, I think, is to not support a growing infiltration of people who would destroy the very free systems that keep our laboratories and other activities open.

Dr. DuBRIDGE. I agree, and the FBI is set up for the purpose of hunting down such people and taking such action as is necessary against them when they are found, and one should not interrupt normal action of the FBI in hunting down such people and taking action against them.

I did not mean to imply that the only brilliant brains are those of Communists—far from it. There will only be an occasional Communist who is found in the fellowship program, and it is for that reason, because it is only on occasion, that to extend to everybody these FBI investigations is so dangerous. The point is that there is only an occasional brilliant mind, too. The great discoveries of science have been made by a small handful of people throughout the past few generations. We never know where those brilliant brains are going to be found.

It seems it to me it is logical to do the best we can to judge the most suitable candidates for fellowships on the basis of their intellectual capacities, intellectual promise, normal honesty and integrity,

and not on the basis of their political beliefs, and then we will have the best chance of supporting the best brains and not of eliminating some of the best ones.

The CHAIRMAN. Doctor, it is true that under the act we insist on investigating all employees of the AEC, whether they are engaged in secret or nonsecret work. It is because legally these students in nonsecret research have been interpreted as not coming within that provision, because they got a stipend instead of a salary that the question arises.

Of course, a pragmatism sometimes will drive you to very great error, but pragmatically speaking, if I may, I just want to raise the thought that if we consider the students as employees of the Commission, then they would come within the operation of the act.

You see, it is a legal interpretation of the word "salary" instead of "stipend," which is pretty thin.

I would like to raise that, because it would seem to me that it would provide a powerful argument against extending this in the National Science Foundation.

Also I think it provides a good argument for getting nonsecret research out of the Atomic Energy Commission just as fast as we can and getting it into the National Science Foundation.

Dr. DuBRIDGE. On that first point, I would agree, that any barrier which we can erect which would prevent the extension of these so-called security regulations into the Science Foundation we should erect.

The CHAIRMAN. If that is the eventual determination of the Congress, that a full FBI investigation shall accompany the oath, I think the scientists ought to take cognizance of the fact that the students are being placed in the category of employees of the Commission, bearing the same burdens that the stenographer or janitor would who is working in nonsecret work.

I personally am desperately concerned that the scientists of the country do not get the idea that we are marking them out for special loyalty treatment. I think that would be very unfortunate. However, if that is the determination of the Congress, if they would look at the fact that we do require, even of the janitor or stenographer who is an employee of the Commission, full investigation, then at least they can take some solace and comfort in the fact that they become employees of the Commission and are not being treated any differently from the other people employed by the Commission in nonsecret work.

Dr. DuBRIDGE. As I tried to bring out in my statement, it is perfectly true the AEC will have to adopt very different policies for its own employees working in its own establishments in contact with secret work than it adopts in supporting any work outside of those secret establishments.

Now, the confusion, of course, is just this: That up until the fellowship program and some of these university contracts started the activities of the AEC were pretty largely confined to laboratories, production centers, and so on, in which secret work was going on and in which everyone from the director to the janitor had to be cleared.

The act, however, authorizes the Commission to extend its activities into these fields of basic science. If it is going to extend its activities

into the fields of basic science, into the universities, then it must, I believe, set up different policies for treating either employees or fellows or anyone else, including those on contract, than it does for employees or contractors within its own laboratories where secret work is involved.

It is just that confusion in the minds of the public about these two areas in which the AEC is authorized and charged to carry on activities: One, the nonsecret university and industrial field and, second, the secret activities of its own installations.

I think it might clarify the situation if the AEC was told it was to carry on nonsecret work, but this would be very damaging to the country and to the AEC because, as has already been pointed out, a lot of these nonsecret fields are of very great importance or potential importance to our activities in nuclear science and atomic energy itself, and it is quite important, I think, that the AEC for its own future good be in contact with those nonsecret areas being looked into by the scientists of the country. As a scientific body it must have an interest in and the support of science. It must have the friendship of scientists in nonsecret fields, for if another emergency were to come along, the AEC would suddenly have to recruit a large additional group of scientists. If it has contact with them, knows them, has their friendship, this task will be enormously eased.

I think it would be unfortunate to say that we must eliminate from AEC activities all nonsecret work, but if we do allow the AEC to continue with its nonsecret work, which I hope we do, then we must also, I believe, allow them to adopt different policies in hiring people, in awarding contracts, and in extending its regulations into those areas.

The CHAIRMAN. I thought you were going to remind me that the employees of the contractors who are not engaged in secret work and do not have access to restricted data under the law do not have to be investigated by the FBI. That is an inconsistency, there is no question about it.

In other words, General Electric at Hanford, assuming there is a man who does not have access to restricted data, although he is working in the reservation—that is, in the town there—does not under the law have to be investigated by the FBI.

Dr. DuBRIDGE. As a matter of fact, this question of being an employee of the Commission is a little difficult to define also because, except for the Commission's direct employees in the Washington office and in their branch offices, nearly all of the men who work on Commission enterprises are not employees of the Commission directly, but of contractors.

The CHAIRMAN. You are a contractor?

Dr. DuBRIDGE. Yes.

The CHAIRMAN. Of a university—

Dr. DuBRIDGE. You mean my institution?

The CHAIRMAN. Yes.

Dr. DuBRIDGE. I believe we do not have as an institution any Atomic Energy Commission contracts, although we have some Office of Naval Research contracts into which some AEC money comes in.

The CHAIRMAN. In the nonsecret work connected with those contracts there are no FBI investigations.

Dr. DuBRIDGE. None; that is right. In fact, as an educational institution we avoid having any secret contracts on our campus whatsoever. Therefore, none of our students—

The CHAIRMAN. You have no secret work?

Dr. DuBRIDGE. We keep any secret work off the campus.

The CHAIRMAN. You are not faced with that problem. G. E. would be and Carbide & Carbon would be.

Dr. DuBRIDGE. Yes.

The CHAIRMAN. Any other questions?

Dr. DuBRIDGE. May I add just one word to a question which came up earlier about the scope of the areas of science in which fellowships have been awarded? I believe this is partly a matter for legal interpretation of the act, but I believe, Senator McMahon, in formulating the act, you and your colleagues purposely made it a fairly broad authorization, recognizing that there were many fields related to nuclear science and whose strength was important to the strength of nuclear science.

The General Advisory Committee has been asked from time to time by the Atomic Energy Commission to advise it on these areas of science, and it has been our policy to interpret the act broadly because broad areas of science need support, and AEC needs the support of broad areas of science.

Therefore, we have recommended rather strongly that activities in the field of biology and medicine and metallurgy and so on be supported and that fellowships be given in those fields. Those are fields of critical shortages of people, and the AEC is always looking for metallurgists, chemists, biologists, radiophysicists, et cetera.

The CHAIRMAN. All those things are made of atoms, are they not?

Dr. DuBRIDGE. They are made of atoms. We felt it was wise for the Commission to extend its activities on a broad basis. We also recognize that when and if a science foundation is created, the activities of the AEC could then possibly be somewhat narrowed because there would be another agency which would take care of these other fields. But there is not any science foundation and for 4 years there has not been any, and we have always said when it is created, things will be different, but it is not created yet and, therefore, offices like the Office of Naval Research and like the Atomic Energy Commission have, I think, been very wise to extend a broad base of support to science.

I think even with a science foundation, a broad interpretation of the act in the fields of science which the Atomic Energy Commission takes an interest in would still be wise.

Senator HICKENLOOPER. Have you finished?

Dr. DuBRIDGE. Yes.

Senator HICKENLOOPER. I just want to make a suggestion here with reference to the field of isotopes and their distribution, beginning with the program of the Manhattan District.

Distribution of isotopes, as I understand it, was not only discussed but authorized in the Manhattan District before we had as many or so great a capacity for production as we have now.

Dr. DuBRIDGE. Yes.

Senator HICKENLOOPER. And that distribution was within the United States.

Dr. DuBRIDGE. Yes, sir.

Senator HICKENLOOPER. That is, at that time. There has been some discussion, which I will not go into at this time, I do not care to anyway, about the international distribution of isotopes.

Dr. DuBRIDGE. I am familiar with some of that discussion.

Senator HICKENLOOPER. I merely suggest to you, Doctor, that since the program of distribution of isotopes was begun in the Manhattan District some time ago, a statute has been passed which has some bearing on the legality of the distribution of isotopes, that the McMahon Act was passed after the program of isotope distribution had been set up and that it does have something to say about the matter of distribution of information and things of that kind.

So that the statute operates now where only Executive order controlled in 1945 and most of 1946.

Dr. DuBRIDGE. That is perfectly true. In fact, I think General Groves was very doubtful as to whether he really had authority to distribute these isotopes. He was very concerned about it. That is one reason he called in this rather large committee of scientists to advise him.

When the Atomic Energy Act was passed, however, that seemed to give the Commission a broader field of operation than the Manhattan District had, and it seemed to make it quite clearly legal for the Commission to undertake activities such as the distribution of isotopes that the Manhattan District only—

Senator HICKENLOOPER. Within the United States.

Dr. DuBRIDGE. Does the Atomic Energy Act forbid the distribution of isotopes abroad?

Senator HICKENLOOPER. That is a legal argument about which we could talk for a long time, but it is my opinion that the Atomic Energy Act does not give any authority for the distribution of isotopes outside of the jurisdictional limits of the United States.

Dr. DuBRIDGE. That is a legal question upon which I could have no opinion. I think it would be very unfortunate, however, if that were the interpretation of the act.

Senator HICKENLOOPER. I am not discussing the merits of the distribution of isotopes to universities any place in the world—that is, from a moral standpoint for humanitarian purposes—but from a purely legal standpoint I think there is a very important legal question growing out of the language of the McMahon Act which will merit some examination.

Dr. DuBRIDGE. I hope this is examined, and I hope the result is that the act is clarified so that the foreign distribution of isotopes is specifically provided for, because I think this is an advantage to this country to strengthen science all over the world.

Senator HICKENLOOPER. The act always could be clarified by a simple amendment to the act making no question about the matter, if it is considered to be highly desirable.

Dr. DuBRIDGE. I imagine you and I would differ on the wording of that amendment.

Senator HICKENLOOPER. No; I think not necessarily; if we were in agreement that the humanitarian distribution of isotopes was justified in various places of the world, I do not think we would have any difficulty in writing the language.

Dr. DuBRIDGE. Fine.

Senator HICKENLOOPER. My difficulty is with the present language contained in the act, and I am quite strongly of the opinion that we and our public institutions should operate within the law and not outside the law.

Dr. DuBRIDGE. I take it there has been a difference of legal opinion on the wording of the law, as to whether this is or is not authorized, and I assume the AEC got legal advice before they entered into this matter and felt they were on sound legal grounds, but on this, of course, I have no expert opinion.

The CHAIRMAN. Doctor, this has indeed not been a boring session, and I want to thank you very much.

Dr. Fermi, we will reserve you for a matinee. I am going to see if we cannot have a meeting, if it is agreeable, at 3 o'clock this afternoon. I think we ought to try to hear you today because I know you are anxious to get back to your work.

So, if that is agreeable, we will meet at 3 o'clock.

(Whereupon, at 12:50 p. m., the joint committee adjourned, to reconvene at 3:00 p. m. of the same day.)

#### AFTERNOON SESSION

The CHAIRMAN. The meeting will come to order.

We have with us this afternoon Dr. Enrico Fermi, who is no stranger to this committee.

I remember with a good deal of pleasure, Doctor, your appearance back in the early days and the help that you were to us. I am glad that you could come back today.

Now, Doctor, you can proceed in your own way to make such observations which you think are pertinent to our inquiry.

#### STATEMENT OF DR. ENRICO FERMI, INSTITUTE FOR NUCLEAR STUDIES, UNIVERSITY OF CHICAGO

Dr. FERMI. I have had a long association with the atomic activities in this country, first with the Manhattan project, later on with the Atomic Energy Commission, as a member of the General Advisory Committee.

Concerning that last phase, I believe it is pertinent to state that when the Commission took over at the beginning of 1947 the situation was not very bright. By that, no criticism whatsoever is implied of the policies of the Manhattan District which were very fine and, in fact, extremely courageous in wartime.

The whole enterprise suffered the natural drop to be expected when the war ended—when the reconversion from a wartime enterprise to a peacetime enterprise had to be accomplished. It suffered from the considerable uncertainty as to what would be the national policy in atomic matters. So that when the Commission took over, they were confronted with a staggering task.

I would like to stress that it was not clear at that time which of the two basic objectives of atomic energy, the war aspect, or the peacetime aspect, would for the next few years be the most important. The emphasis was shifting while the policies were being worked out.

The problem that faced the Commission when they took over their job was to set the work going in a vigorous way. Weapons had been

designed during the wartime. There had been some rather vague and informal ideas for improvement of weapons but there is nothing that could even approximately be called an improved design.

The laboratory responsible for carrying through this aspect of the work, the Los Alamos Laboratory, at that time was suffering somewhat from the general paralysis that was pervading the whole enterprise. We can consider it one of the great achievements of the Commission to have started the Los Alamos program on a vigorous basis. You know that the new weapons that have been produced are satisfactory. This is, perhaps, the best and most material proof that in this line progress has been made.

Since I am mentioning the Los Alamos Laboratory, I would like to state that the place is now in full swing and activity.

A problem that cannot be separated from the problem of weapons is that of the production of fissionable materials. There, too, at the beginning of 1947 the situation was somewhat confused. The situation now is much better. Materials production is rapidly improving. I would not be entirely truthful if I did not mention that there are very serious problems with which this committee doubtlessly is familiar, with which the Commission is struggling at present. They are problems of recovery, problems which will have to be solved.

I believe that the steps are being taken and have been taken that will lead to such a solution. I believe, in other words, that although the situation now is better, much better than it was at the beginning of 1947, it is steadily improving, and I expect still further progress.

Also, the problem of raw materials has been tackled with extreme energy by the Commission. Subject to the limitations of nature, very nice progress is being made, and I do not see any reason for immediate concern in this field.

These three are the angles that most directly concern the activities of the Commission in the military line. There are, then, the peacetime activities and of those the one that has received the greatest attention is the problem of reactors for power production.

At the end of 1946 one thing was clear, and it is clear now, that energy could be produced—after all energy had been produced. It was not clear to anybody how energy could be produced in an economical way except for the fact that it was the general consensus of opinion that the problems would be solvable.

The problems are to a large extent of a technical nature. One needs materials that can stand very high temperatures and still operate satisfactorily in a nuclear reactor.

I have the impression that the general opinion at that time was somewhat underestimating the difficulties. These difficulties are not of a theoretical nature. But in any major industrial development, like the atomic development is, problems which are not theoretical but are practical are of paramount importance.

There also had been a certain overemphasis built up in public opinion as to the immediateness of this program, through statements of people who thought they were informed and, perhaps, were not extremely well-informed.

The reactor problems indeed were more difficult than had been estimated and, unfortunately, complete solutions are not yet available. In spite of that, I would want to go on record with the statement

that very substantial progress has been made, in ironing out that great mass of detail which, in a technical problem of this magnitude, constitutes the core of the development.

At present, work is going on which, I hope, will lead to some results. I would not want by any means to be misinterpreted. I do not expect extremely startling industrial results for at least very, very many years to come, but I am reasonably confident that progress will come and that there will be in the not too distant future something more concrete to point to than general technical progress.

Among the peaceful applications of atomic energy, is the production and use of isotopes. I can only applaud the policy of the Commission in this line. I do not know at all what are the legal aspects of the question since in this field I have an extremely limited competence, but I believe that the generous distribution of isotopes, both within the United States and to foreign countries is exceedingly right, and has done much good to this country.

As I say, I do not want thereby to enter into a dispute of what is the exact wording of the law on which I feel myself somewhat out of my depth.

Finally, I would like to mention one more extremely important aspect of the activities of the Commission that has been stressed by Dr. DuBridge this morning: the promotion of science.

If I read correctly the law, promotion of science is one of the duties of the Atomic Energy Commission and, I believe, that the Commission has recognized this duty and has acted quite courageously and effectively in this direction.

I share the view of the previous witness that promotion of science should be taken in a not too strictly utilitarian meaning. If we think of the recent history it appears very clearly that results of science have such unexpected and unforeseeable connections with important human events and important industrial achievement, that to attempt to foresee and to catalog what is the science that will be "useful" and what is the science that will not be "useful" would be a task that would require much more knowledge of the future than any of us can expect to have.

For this reason, I have been very much in favor of the actions of the Commission in supporting general science in connection and in collaboration with the Office of Naval Research, in supporting a considerable amount of basic science in the laboratories of the Commission; and finally in supporting education in the field of science.

In this respect I am afraid that I shall have to repeat some of the arguments of Dr. DuBridge as to the present controversy on clearances of applicants for fellowships.

It has been alleged that a person who is loyal should not be opposed or distressed if such loyalty is checked. This indeed is probably true from a somewhat theoretical standpoint, but not from a practical point of view. I have seen very many cases of loyalty investigations. It is my duty to state that such investigations are usually carried out in a very considerate manner. I have seen very few cases of hardships arising from such investigations that could reasonably have been avoided.

The questions that are asked are fair. FBI agents come to see me every once in a while to ask me, "Do you know anything about Mr.

So and So?" There is never, in my experience at least, any attempt to cause me to make any damaging admissions.

But I know a great number of students and young men in science and I notice a general preoccupation. After all, science is a matter of investigation into mysteries, and scientists are people who have a natural curiosity, who think that way professionally. They are considered good scientists if they are very prone not to take anything for granted.

Senator HICKENLOOPER. Well, Doctor, may I interrupt?

Dr. FERMI. Absolutely.

Senator HICKENLOOPER. Is there any criticism, then, on those who have the responsibility for Government to not take anything for granted and to be very sure in investigating the mysteries of people's subversive beliefs?

Dr. FERMI. That is a very good question. I am afraid I have no answer. [Laughter.]

Well, the point is this: Think of a young man—a man say of 20—he has seen very little of life; he has a certain natural curiosity. Supposing he says "They tell me the Communists are so bad. All right, let's see what they are; let's take the Daily Worker"—or whatever is their official publication—"and I shall just see what they say for themselves."

An attitude of this kind is something that I would view with some sympathy. After all, why not? Why should not a young man get enough information to be disgusted by himself as to what he may read?

Now, the landlady sees the Daily Worker lying around; comes the FBI agents; the landlady says, "Well, yes; he is a nice chap, but" and there the man goes on record as a very dangerous character who had better be kept out of the ranks of the loyal American scientists.

I understand the philosophy of the inquiry is not to spot an offender but to detect a risk—well, to be considered a poor risk is no irrelevant matter for a young man who has not had a chance to be established. A young man who is trying to acquire that competence that may eventually lead him into establishing himself may properly object to the danger of being so branded. I believe that the percentage of those who would be properly weeded out by a loyalty investigation is extremely small, but I believe that a widespread investigation of students not engaged in secret work would have a very depressing influence.

There are also false rumors as to how much police methods are adopted in such inquiries, but after all people react to things for what they believe them to be and not necessarily for what they are.

The impression is abroad that on the slightest hint of the janitor or the landlady or whoever may have the occasion to look into your wastepaper basket you may be branded, and you may find it very difficult, and, at least, very unpleasant to clear yourself.

Now, that makes for a very unhealthy feeling. I sense that sometimes young people in the schools are not quite frank. They do not talk with that complete carelessness which I believe would be a privilege of their age.

For this reason I want to endorse most strongly the views that were mentioned this morning by Dr. DuBridge, that loyalty investigations should be looked upon as necessary evils wherever they are neces-

sary. To expand them into a field in which they are not clearly necessary is, in my opinion, a grave mistake. It would save a ridiculously small amount of money that might go to an undeserving person but make all the fellowship program less effective and less generous and less appreciated. I believe the price is just too high.

This is all that I would want to say in the way of general comments.

The CHAIRMAN. Senator Hickenlooper.

Senator HICKENLOOPER. I think it is very fine of you to come down here, Dr. Fermi. I want to take this occasion to publicly say—well, I am not sure whether I want to say that for your great accomplishments in nuclear physics, whether we owe you a debt of gratitude, because I am not certain that I am happy that we ever invented the atomic bomb.

Dr. FERMI. It is certainly a questionable point.

Senator HICKENLOOPER. But for your invaluable contribution to this science, as a scientific contribution to the world of science, you have a debt of gratitude, I think, of people everywhere, that cannot be repaid.

Dr. FERMI. Thank you, Senator.

Senator HICKENLOOPER. I believe that with respect to your contribution, it was some of your bold and rather revolutionary predictions that enabled people to have confidence in building the first pile under the stadium in Chicago and you did not know whether it would blow up or not.

Dr. FERMI. It did not. [Laughter.]

Senator HICKENLOOPER. For which we can either be grateful or perhaps take some other attitude, but I do want to have you know that so far as I am concerned, the appreciation of your unique contributions to science—your contributions are appreciated, and I know that your contributions now in the future will be equally as far-sighted and as startling.

Now, I may find myself in some little disagreement on philosophy. I could not discuss science with you, and certainly I am willing to bow to your judgment, of course, in any matters scientific.

I have just one question that I would like to put to you: Do you believe that economical power development, that is, in any kind of a competitive way with fuels that we have now, economic power development is anywhere in the reasonably foreseeable future out of this thing, or would it be experimental, the establishment of new laws and other things?

Dr. FERMI. It is a difficult question. I may try to answer it to the best of my ability.

Senator HICKENLOOPER. Well, the reason I ask that is that I noticed in the papers yesterday or this morning statements that power was just around the corner. I mean that was the understanding apparently taken from the testimony yesterday. That is not my understanding of the situation, and while we produce power or heat in these piles now, yet I am talking about economic, competitive power that could be used in industry.

Dr. FERMI. Well, I certainly agree with you. The thing is not around the corner. Some limited experimental applications may be possibly not far in the future. Perhaps some naval applications may come forth in the not too distant future, but if by "competitive"

power, you mean something that could be comparable to coal or oil, I believe that production of such huge amounts of power, if they ever will be produced are certainly very, very far in the future.

On the other hand, perhaps, one should not take necessarily a too pessimistic view about this situation either. There are basic possibilities; I find it really extremely difficult to strike the right note between optimism and pessimism.

You see, we talk of a matter certainly of 15 or 20 years. Now, who is the prophet who can see things at that distance? Atomic power may ultimately develop not into a competition but, rather, in supplementation of conventional fuels.

I believe that it would be a great disservice to engender unjustifiable hopes—I believe that it is very desirable that the public should stop thinking that atomic power is around the corner, because if they do so they are in for a disillusionment, and the public has a right to know and certainly should get a reasonable perspective of the program.

If atomic power will develop at all into a very important industrial fact, it will do so only in a very many years. That is very clear to me.

There might be some interesting spotty applications to this or that field to which the special features of this form of power are particularly suited. But before atomic power becomes a really large-scale affair it will take a long time.

Senator HICKENLOOPER. Well, the only purpose of my question was that periodically things appear in the public print, statements of people, and maybe some know what they are talking about, and are misinterpreted, and others may not know what they are talking about, but statements appear periodically which give recurrent hope to people that we are just on the verge of substituting atomic power for other methods of the production of power, and it is only in the hope that it can be put into its proper perspective, and that delusions are not engaged in, that I bring this up.

I, for one, if we could have atomic power tomorrow, would be very happy, and I think a great many people would. It would cause us some great readjustments, but I think I would be glad to see it arrive as a progressive scientific development at any time that it could.

But there are many people who write to me and say, "I saw in the paper that maybe next year we are going to be running engines on locomotives with atomic power." Or they say, "When are we going to have experimental atomic engines in our automobiles?" Or they write about things of that kind. I write back to them and tell them in my judgment it would be a very, very long time before we even approach that, but I also qualify by saying that I am not qualified to give a scientific opinion on it.

Dr. FERMI. I do not know whether I am qualified, but certainly I agree with your opinion.

Senator HICKENLOOPER. If you are not, I do not know who is, because if there is anybody who is qualified, I think you would be in that class.

Dr. FERMI. And I believe it is certainly a public service to try to present the chances into a good perspective because, as you say, occasionally misinformed statements are interpreted correctly, or informed statements are misinterpreted and a great confusion arises in the public opinion.

Senator HICKENLOOPER. Well, thank you, Doctor. It is very nice of you to take your time to come down here. Good luck to you.

Dr. FERMI. Thank you.

Senator HICKENLOOPER. I have no further questions.

The CHAIRMAN. Doctor, of course, if we had been successful in our efforts to get an international control agreement, would you say that that would have speeded up the accomplishment of the peacetime achievements in atomic energy?

Dr. FERMI. I think very probably yes, and for the following reasons: I believe that the atomic development suffers under the necessity of a tight secrecy policy. Unfortunately, the peacetime applications are all wrapped up in the same package with the wartime applications.

As long as the scare of the destructive potentialities is there, there is no alternative but to keep secret all that can lead in the direction of the military applications.

But this secrecy acts as a tremendous brake on progress. If I may give you an example. I am teaching a course in nuclear physics at the University of Chicago, and I would have liked to give my students a certain background to the work in atomic energy.

I have a fair notion of what is classified and what is not classified, but still the feeling that I would have had to weigh my words very carefully—I could have been asked embarrassing questions, and I would have been faced with the choice of either telling a student in the open classroom, “I am sorry, my boy, but this is something that I am not allowed to answer.” And just this uneasiness drove me to stay off the subject.

Now, I do not think my lectures would have been extremely effective, but there you have some 50 boys or so who have lost that chance to acquire a training in atomic energy problems.

Also at present in many foreign countries, so far as I know, people just do not even think along the direction of atomic energy problems since they say, “There is this American monopoly, and they keep everything wrapped up in secrecy.”

Perhaps the belief is that in basic science much more is kept under wraps than actually is. But just the feeling of this blank wall—the fact that nobody knows exactly where the wall begins, how far one can go without overstepping the limits—acts as an extremely serious psychological block against what would be a very natural and very appropriate field for free investigation.

For this reason, I believe that, if there were any conceivable way to overcome the international difficulties, an extremely valuable speeding up of progress would result. It might be that something would be found; perhaps, not power and not bombs, but just something else; who knows.

The CHAIRMAN. Well, I think it is important—just as Senator Hickenlooper does—that we do not get any misapprehensions about it being right around the corner, but, as I say, it is very difficult to prophesy for the next 15 to 20 years.

You know, Doctor, 20 years, 15 years, seem to be a long time, but really it is not very long, is it? It is  $3\frac{1}{2}$  years ago now that we began to talk about it in Congress, and it seems to me as though it were yesterday.

Dr. FERMI. It is very true that 15 years pass—perhaps, one should make the following remark: That unless a vigorous program is kept up, the 15 years will become 30. I would not want my words to be interpreted as discouraging for the reactor program. The way is long, but a long way cannot be traveled unless one starts to move along it.

Senator HICKENLOOPER. I think the Chinese say that the journey of a thousand miles begins with the first step.

Dr. FERMI. That is very true.

The CHAIRMAN. I think Henry Ford began the manufacture of his car in quantity around about 1906 or 1907. Of course, he made individual cars before that, and in that period of about 40 years, we have had a total transformation in American industrial life and the whole economy due to the mass production of automobiles.

I reflect on the fact that I was born in 1903, and it seems——

Senator HICKENLOOPER. Just a kid. [Laughter.]

The CHAIRMAN. Yes; just a kid. It seems like a very short time ago.

While I think it is true that we must not lead people to believe it is rather around the corner, we still have to remind people when we are thinking about something that may change the whole pattern of life, that may do so many things, through this atomic energy; we must also remind them that 15 years is not a century or two.

Dr. FERMI. I think I cannot agree more with what you say. I believe that is what should be done, and it is perhaps just difficult to do it right. I believe it would be irresponsible to make rashly optimistic statements.

On the other hand, I am convinced that it would be a wrong policy to say, "Let us drop it and save the money."

The CHAIRMAN. Doctor, it is now  $21\frac{1}{2}$  years since the Commission took over, almost; where are they now, in your opinion with respect to where you expected them to be after  $21\frac{1}{2}$  years?

Dr. FERMI. I believe, as I said before, that the progress has been very considerable. I do not want thereby to give the impression that the progress has been just the very maximum possible. Naturally there have been things that, after the fact, could have been started in a better way but I believe that it is fair to say that the progress has been greater than what I would have expected.

I was at that time really somewhat discouraged. I saw things drifting so hopelessly that if you asked me the specific question of what I thought at that time, I do not think I would have overestimated what the achievements could have been in that period.

The CHAIRMAN. Well, thank you very much indeed, Doctor. It is good to see you again. I hope we will have a chance to see you again in the time to come.

Dr. FERMI. I hope so. Thank you.

The CHAIRMAN. Now, I understand from the Commission that they have two, possibly three, more witnesses, and I also believe this will conclude the Commission's presentation?

Mr. VOLPE. Yes, sir.

The CHAIRMAN. So, we will meet then—plan to meet—on Monday at 10:30.

Mr. VOLPE. Mr. Chairman, to conclude Monday morning, which is our aim, and not to burden the committee with many witnesses, we have endeavored to prepare some statements on various aspects of the program, more important aspects of the program, which we would ask permission to insert in the record. This might be done Monday or perhaps even later.

(The data referred to above are marked "Exhibit 32" and will be found in the appendix.)

The CHAIRMAN. All right.

We will recess then until Monday at 10:30.

(Whereupon, at 3:40 p. m., the joint committee adjourned to reconvene at 10:30 a. m., Monday, July 11, 1949.)

# INVESTIGATION INTO THE UNITED STATES ATOMIC ENERGY PROJECT

MONDAY, JULY 11, 1949

CONGRESS OF THE UNITED STATES,  
JOINT COMMITTEE ON ATOMIC ENERGY,  
*Washington, D. C.*

The joint committee met, pursuant to adjournment, at 10:40 a. m., in the Caucus Room, Senate Office Building, Washington, D. C., Senator Brien McMahon (chairman) presiding.

Present: Senator McMahon (chairman); Representative Durham (vice chairman); Senators Vandenberg, Knowland, and Hickenlooper; and Representatives Price, Elston, and Van Zandt.

Also present: David E. Lilienthal, Chairman; Sumner T. Pike, Commissioner; Lewis L. Strauss, Commissioner; Gordon E. Dean, Commissioner; Henry D. Smyth, Commissioner; Carroll L. Wilson, General Manager; Frances Henderson, Assistant to the Chairman; Joseph Volpe, Jr., General Counsel; Bennett Boskey and Everett L. Hollis, Deputies General Counsel; Morse Salisbury, Director, Rodney L. Southwick, and Charter Heslep, Division of Public and Technical Information Service; Dr. Shields Warren, Director, and Dr. John Bowers, Deputy Director, Division of Biology and Medicine, all of the United States Atomic Energy Commission.

Dr. Alan Gregg, Director, Medical Research, Rockefeller Foundation.

The CHAIRMAN. The meeting will come to order.

I have here this morning a telegram, which I wish to read into the record, signed by W. W. Waymack. Mr. Waymack, as we know, was a member of the Commission until a few months ago. It reads:

DEAR SENATOR MCMAHON: I wish to say that the sole reason for my nonappearance in Washington to make this brief statement is that it has seemed needless and that I am too worn down physically to undertake any needless things.

I ask the privilege of acknowledging on the record of the current hearings my one-fifth share of responsibility for everything that happened or didn't happen under the authority of the United States Atomic Energy Commission during my membership or as a later consequence.

This especially applies to all that may eventually prove to have been instances of human fallibility or lack of clairvoyance.

As to credit for important accomplishments in the Nation's interest I'd settle for a very much smaller fraction; but in that I have not the slightest interest. It is enough that the accomplishments were brought about.

As a member of the Commission for the first 2 years and 2 months I am well content to let the total record speak. Fortunately, part of it has now been presented and will be available to the public.

With the possible advantage of a few months of detachment, I believe the overall record is one of very substantial improvement in the country's atomic energy position—much greater improvement than on any particular day of at least the first year and a half seemed in the range of the achievable.

Respectfully,

W. W. WAYMACK.

875

We also had hoped to hear a witness for the Commission today, Mr. William W. Webster, who is chairman of the Military Liaison Committee of the Commission. Unfortunately, Mr. Webster will not be able to appear. He is detained in his home State as the result of a very critical illness in the family. I am informed by the executive director of the committee that he is going to furnish a statement for the record.

Now, gentlemen, as I understand it, this is the last day of your presentation.

Mr. LILIENTHAL. That is correct, sir.

The CHAIRMAN. Let us be about it.

Mr. LILIENTHAL. Mr. Chairman and members of the committee, the Commission has in mind three witnesses for this morning, these to be the last witnesses, as far as the Commission is concerned, in these public hearings.

They are Dr. Shields Warren, pathologist on the staff of the Deaconess Hospital in Washington, and the Director of the Commission's Division of Biology and Medicine; Dr. Alan Gregg, director of medical research for the Rockefeller Foundation, who is the Chairman of the Advisory Committee on Biology and Medicine of the Commission; and Mr. Joseph Volpe, Jr., the Commission General Counsel.

Dr. Warren will be the first witness.

#### **STATEMENT OF DR. SHIELDS WARREN, DIRECTOR, DIVISION OF BIOLOGY AND MEDICINE, UNITED STATES ATOMIC ENERGY COMMISSION**

The CHAIRMAN. Good morning, Doctor.

Dr. WARREN. It is the primary task of those of us in the Division of Biology and Medicine concerned with the work in the field of atomic energy to present and to establish and see that there are maintained standards for health and safety of the employees of the Commission and its contractors. It is our duty to see that research pertinent to the field is developed. It is our duty to see that the health and safety of the people as a whole, so far as atomic energy bears on it, is taken care of.

Now, in our continuing work to maintain safety and to fight against disease, we have rather more than the normal incentive in this field, because this is an entirely new field, a field which comes close to every person in this country in the normal course of events, and which may come even closer in the event there should be at any time an outbreak of hostilities.

Radiation is a hazard which is implicit in working in the field of atomic energy. We have been alert to the problems of controlling radiation from the very first.

The Manhattan Engineering District had a splendid record in maintaining safety in this regard, and the work that they did was based on fragments of knowledge and fragments of experience that had been gained from the treatment of patients in the past.

It is necessary for us to round out those fragments of knowledge to get an actual and complete whole.

Now, at the present time there are several places where we need more accurate information than is currently generally available. One of these is how best to protect the people of the country in the event

of an atomic disaster of any type and, secondly, to appraise such a problem.

At the joint congressional committee's hearing on Thursday, July 7, 1949, the chairman of the committee, at the suggestion of Congressman Price, requested that the Atomic Energy Commission prepare and present at a later hearing a summary of what may be publicly stated about the medical effects of atomic bomb explosions.

Several agencies and numerous medical men and biologists have, of course, studied this problem. The medical effects of the explosions over Hiroshima and Nagasaki were first studied by the joint commission made up of medical officers of the Army, Navy, and Manhattan District, and later by the United States Strategic Bombing Survey. Now, and for some time past, the Atomic Bomb Casualty Commission of the National Research Council, whose work is financed by the AEC, is carrying on these studies.

Information has also been gathered on the effects of the Bikini explosions and the after-effects of the Alamogordo explosion, which was the first test in New Mexico, as you will recall.

The Commission is financing studies of these and related problems by the Los Alamos Scientific Laboratory, the Argonne and the Oak Ridge National Laboratories, the University of Rochester, the University of Chicago, the University of Tennessee, the University of Southern California, Western Reserve University, Harvard University, Cedars of Lebanon Hospital, the University of Kansas, the University of Virginia, the University of Denver, Washington University, Columbia University, the University of Oregon, the University of Michigan, the University of Washington, the College of Physicians and Surgeons of New York, and New York Post-Graduate Hospital.

The progress of these studies is carefully reviewed by the Advisory Committee for Biology and Medicine, as well as the staff of the Division of Biology and Medicine.

I would like to read excerpts from this following statement and enter the statement as a whole for the record, if I may.

(The data referred to above are marked "Exhibit 33" and will be found in the appendix.)

Of the results so far obtained in these studies, some are classified and cannot be publicly stated. There is, however, a considerable body of fact on medical effects of atomic bomb explosions which is unclassified or has been declassified. It has appeared piecemeal, in individual documents, which are listed at the conclusion of this statement.

Few, if any, of these have had wide circulation among the general public or even the professional public. My colleagues and I have compiled the salient points of the nonsecret literature on the subject into a summary which has been examined by the declassification branch of the Commission, found to contain no restricted data, and authorized for issuance by the Commission. It is as follows:

The effects of an atomic bomb vary with the method of explosion, but there are three basic types of injury produced; mechanical, from the blast effects; thermal, from the radiant heat of the burst and from the fires burning in the wreckage; and radiation, from the radioactivity released by the burst.

Hiroshima, Nagasaki, and the first Bikini test may be taken as typical of an explosion in air. At Hiroshima and Nagasaki a majority

of the deaths and injuries resulted from blast effects due to the collapse of buildings and to falling debris. Many additional casualties resulted from burns, flash or secondary, incurred in the fires that raged after the explosion. Fifty to sixty percent of the casualties were due to blast effects and flame burns, 20 to 30 percent to flash burns and 15 to 20 percent to ionizing radiation. However, had there been protection from blast and fire, nearly as many people would have died from radiation effects alone. This is explained by the fact that death was officially attributed to the most obvious cause, either blast or burns. For instance, an individual crushed by falling concrete after being seriously burned was classed as a blast casualty.

Perhaps the most readily understandable way of describing the effects of atomic explosions is to use zones bounded by concentric circles whose center is the point of explosion. The effects in these zones depend somewhat on local factors, and change gradually rather than abruptly.

Within a half-mile radius of the point on the ground directly under a bomb explosion similar to those used against Japan and detonated at a similar height in the air the following would occur. The explosion of the bomb creates blast pressure which will demolish all structures not of reinforced concrete or steel construction within this area. In well-constructed buildings of the latter type, structural damage of 70 percent or less will occur. Persons not sufficiently protected by shelter able to withstand this amount of blast would undoubtedly be killed by falling buildings or flying wreckage.

Intense thermal energy generated by the explosion would likewise cause fatal burns to unprotected persons and would start fire in the wreckage.

The explosion of an atomic bomb results from the sudden simultaneous rupture of the nuclei of the atoms of the element composing the bomb. This releases an enormous store of energy as invisible radioactive waves or particles which are highly destructive to living tissues. The various particles and rays differ in their ability to penetrate objects, such as lead or concrete, and in their ability to penetrate the body. However, the quality of their effect on the body is the same. From the standpoint of quality of effect they are similar to the X-rays used widely in the treatment of disease.

Because of the concentration of radiation within this area, nearly everyone not protected by earth, steel, or thick concrete would die. This does not mean instantaneous death, but the most serious cases would succumb from within a few hours to 4 or 5 days after exposure. A second group would develop susceptibility to infection due to the destruction of their white blood cells and would die from 4 days to 6 weeks after exposure. Another group would incur multiple hemorrhages and die within 2 to 8 weeks from this cause.

Among the things that radiation does is to destroy white blood cells and bone marrow and injure the intestines. These injuries cause decrease in white blood cells with attendant susceptibility to infection, progressive anemia, increased bleeding tendencies, nausea, vomiting, and bloody diarrhea. However, individuals vary in their sensitivity to radiation—thus, a dose fatal to one might only make another sick.

There were other observed effects. For example, with relation to male sterility, since the male testicle is more exposed to radiation be-

cause of its position and lack of covering than is the female ovary, its cells are more easily damaged. There was evidence of diminished reproductivity for a period of 3 months in males who were within 1 mile of the explosion point. That is, in Japan. In the male the sterilizing dose of radiation is very close to what the fatal dose is.

Hair loss is another feature that evidences damage done. It is not significant, but simply is evidence of the internal damage that has occurred.

There are further details, sir, that I will present for the record in this statement, if I may.

Dr. WARREN. Now, we are concerned with knowing the details of radiation and how radiation acts and details of bomb damage for several reasons. In the first place, we have to know how to protect our workers. In the second place, we have to know how to protect the general population. We have to have the available information for the organization of sound civilian defense planning subsequently to be developed.

Radiation is a daily hazard in most of our operations. I do not know whether any of you are wearing wrist watches with luminous dial. Have any of you a luminous dial wrist watch by any chance?

Senator HICKENLOOPER. I have one here.

Dr. WARREN. If I may borrow it, Senator, I would like to show briefly the sort of—

Senator HICKENLOOPER. It is just the numbers.

Dr. WARREN. This is one of the ordinary type of survey meters that we use in the plant to detect stray radiation and to be sure that it stays under control.

If you will watch this dial here, if there is a good measure of radioactivity on the Senator's watch, it will be indicated as I bring this up.

Mr. PRICE. I had that experience at Oak Ridge.

Mr. VAN ZANDT. It is a Geiger counter?

Dr. WARREN. Yes, a modified Geiger counter. You can see how the dial goes over as the wrist watch is brought near.

Now this amount of radiation which is present is not a type of radiation which is dangerous, but it is a type of radiation which is approximately the amount that we regard as safe for a workman to receive over the total surface of his body during the day.

This means, then, that we have to have a very high standard of control to be sure that our operations are safe. We know that this level of activity is safe.

Thank you very much, Senator.

We try to protect people in a number of ways. Some you have heard recounted in the very complex type of buildings and apparatus that has had to be used, and you will remember in discussion of the cost of some of the plants that the complexity of apparatus and the need of one or another type of remote-control apparatus was a very important factor in the cost.

Now here are the sort of things we use in the laboratory right along with men working with small amounts of radioactivity, and these sealed up can give you an idea of what thousands of times this activity will have to have in the way of protection.

This, for example, is a holder for a flask so that we can work over and behind a shield. The flask will be grasped automatically by this,

and then the stopper is removed in this fashion by this apparatus, or apparatus such as this, and then we have automatic taps, so that the workers can be kept safe all the time that there is a potential exposure.

Now, how much has been accomplished in this attempt to keep the workers safe? We are quite proud of the fact that we have as low a level of absenteeism from sickness and injury of any type in the plants as can be reasonably maintained. The percentage of absenteeism at the Hanford works, for example, is 1.37 percent, which is something that I think any manufacturing plant would be proud to have, in spite of the very hazardous nature of the work.

In addition, as evidence that it is safe to work near and live near an atomic plant, that we have fulfilled our responsibility to the environment, to the people who are living near our plants, we may take the situation at the town of Richland, which you will recall in where the workmen and their families at the Hanford works live.

In Richland the mortality rate, with an average age of 31 years, as against an average age of 33 years for the United States as a whole, is approximately one-third of the mortality rate for the country as a whole.

There has been some talk about waste disposal once or twice. It might be interesting to note that it is sufficiently safe to take water downstream from the Hanford plant, that one of the water supplies of Richland comes from the river downstream from the plant.

Now, since radiation is a problem that comes close to all of us, we have got to learn every aspect of it that we can. We cannot go simply on the basis of chance observations, as in the past, but we have got to have a sound research program which will enable us to know what the problems are and how we can meet them.

I would like to cite for you a few examples of the sort of things that we are trying to do at the present time. The driving motive in this research is not alone a desire for scientific distinction, or for making a living, but it is the fact that unless we keep the lead in this field our very survival is involved in it. This is not something that we can work at or not as we choose; but if we want to survive, we have to work at it and work at it hard.

Some of the things that we are applying these substances to in the field of biology I believe would be of interest to you. The food supply and the shelter and shade provided by plants and trees is, of course, of tremendous importance for all of us, and one of the important things is the control of diseases of importance from the agricultural standpoint.

You are all familiar with what chemotherapy—that is, the use of sulfur drugs, penicillin, things like that—can do for humans. It has only begun to be disclosed as to what they can do for plants, and at the Storrs Agricultural Station at Storrs, Conn., work is under way to determine what chemotherapy can do in the treatment of the Dutch elm disease, a recently introduced disease that is wiping out one of our most important shade trees in the East, and we hope from that to determine the most effective means of applying chemotherapy to these agricultural large-crop plants.

You have heard a good deal about mutations as the genetic effect of radiation. One has to remember that mutations have their good sides as well as bad sides, and we have under way between North Carolina and Oak Ridge the first large-scale attempt to work out the appli-

cation of good mutations to crop plants. We have got 5 acres that have been planted to peanuts whose seed have been irradiated, and are watching for the most productive plant and most disease-resistant plant, to be able to get the further seeds from them for producing a healthier and more productive variety of the peanuts as a crop plant.

There are all sorts of odd points I could touch on, such as the fact that if you put fertilizer on a pecan tree it does not do any good the year you put it on; it is only in subsequent years that it is taken up; that the various types of fertilizers which were widely publicized a while ago that had to do with alpha radiations, so-called alphanatron, have been tested out with the Department of Agriculture, final testings have not been completed, but preliminary results show there is no value in this, and it will save a considerable number of dollars to the American farmers knowing that they do not need to invest in this type of thing.

Out at the Michigan State College we have an experiment going on in regard to the control of leukemia in fowls. That is a disease of the white blood cells, and leukemia in fowls is one of the most serious things that attacks the hens and does great damage to the poultry industry.

It is also of interest because it is closely related to the same disease in humans, and we are hoping by the work here to be able to do work in the human field as well.

It has already been shown that one of the radioactive isotopes, phosphorous-32, is a sound method of controlling and producing remission—periods of freedom from the disease—in human leukemia. There are other ways of doing it, too.

There are still many ways in which various of the isotopes can be used in cancer research and in all types of research, isotopes, of course, are the most important tool that has been evolved in the field of medical and biological research within the last century. It is being explored in a great variety of ways.

In order to avoid duplication and overlapping with other experimental programs, we have tried to correlate very closely what the Public Health Service and other activities are carrying on, and we have taken as our role in the field of cancer research, particularly, the need of attacking the problem of what the short-lived isotopes can do—the ones that cannot be moved away from our atomic plants—that enable us to give what you might call flash irradiation to cancer sufferers, and we have established and are already having work in this field going on at Brookhaven and will shortly have it going at Oak Ridge, and next year hope to have it going at Argonne. We are supplying isotopes free for cancer research, and this has been a tremendously important stimulus to work in that field.

We have found that one radioactive substance, cobalt, which when irradiated in the atomic pile, becomes active. We found that this substance is just as good as radium, and it is somewhat better in some ways, because it is cheap and it is flexible. You can utilize it in a variety of forms instead of having to hold it to a certain type of applicator only.

Also if it accidentally gains access to the body through a breaking of an applicator, as sometimes happens in radium, we do not have a very dangerous situation of fatal poisoning because we have a relatively

harmless substance, which is excreted normally and not held in the body for long periods of time, as is radium.

I know most of you, probably all of you, have been through various of the plants, have seen the safety precautions that are taken there, have seen how the work goes on there. I think it is less easy to understand that in order for that work to be done intelligently, intelligently carried out, and for that work to be safely done, there has to be a tremendous amount of research done, and we have to turn not only to our own laboratories, but to the research workers in universities for this. We have been very fortunate in enlisting their cooperation.

In this general field, as things stand now, in this field of biology and medicine, as we see it, we are achieving a high degree of safety in the protection from irradiation. We have not got an adequate means of treating those who have been exposed to radiation. We do not know all the details of how irradiation acts. We need to know those for effective therapy, for effective diagnosis.

In addition, it is very important that some of the basic activities of the body be understood, how the various proteins, which are the building blocks of the body, are put together, how radiation affects them in the process of their being put together.

We feel that for a young enterprise, we have made worthwhile contributions, but being a young enterprise, much of our activity must lie in the future. We realize that we have a very heavy responsibility laid on us, to be in a position to protect the people of the country in the event of an atomic disaster of any sort, and to have the available knowledge, not available as a last minute effort, which is always too late, but worked out in time.

We feel a real urgency in this thing. We keep in mind that four years have gone by since 1945, and instead of international control and peace being nearer, it looks almost farther away than it was at that time.

We have certain concrete accomplishments, a few of which I have outlined for you. Others I could add, but I simply want to use these as samples of what we have tried to do and are carrying on.

The CHAIRMAN. Thank you very much, Doctor.

Senator Hickenlooper?

Senator HICKENLOOPER. Thank you, Dr. Warren. I understand that this is true, and if so, I think it is a remarkable thing: that beginning with the Manhattan District operations in atomic radiation, down to the present time, there is no instance of where any person has been injured by atomic radiation, except where there was a violation of the restrictions and anticipated dangers.

Dr. WARREN. Yes, that is quite correct, Senator Hickenlooper.

Senator HICKENLOOPER. In other words, this whole program from its inception has been operated with such a factor of safety that, except in cases of violation of known restrictions and anticipated dangers, there have been no injuries of any moment at all; is that correct?

Dr. WARREN. That is quite correct.

Senator HICKENLOOPER. I think it is a magnificent record of health safety that has existed throughout the entire operation of our atomic program.

Dr. WARREN. It is a very creditable record, and I think that full credit should be given to those who have worked in it from the first, and I am very proud to have had a part in it in latter years.

I think that you touched on a very important thing there when you mentioned factors of safety, Senator, because what we had to do initially was to take a fragmentary knowledge, what known facts have been picked up about the irradiation of people for cancer, the irradiation of people accidentally in the production of radium earlier, and apply a factor to that and say that by cutting this down to this point, we think we will be safe.

What we want to do, what we have got to learn through our research, is to make that factor of safety not a nebulous thing pulled out of the clouds, but make it a real thing so that we can say this is what we need to do and, perhaps, we can do certain operations much more economically if we can say that if such and such is done, the risk is thus and so.

As it is now, we say we are afraid the risk may be thus and so and, therefore, we will not take any chances in killing people, but we will spend a few more dollars and provide the safety that is required for it.

Senator HICKENLOOPER. And your constant effort is to narrow the limits within which safety is confined in this whole program?

Dr. WARREN. Yes, exactly.

Senator HICKENLOOPER. And that requires nothing but experience and time.

Dr. WARREN. Experience, time, constant research to understand the fundamental principles.

What we need to know most is what happens to living cells. For example, take the ordinary fruitfly, *Drosophila*, with which so much experimenting is carried on. The adult fruitfly can stand 155,000 "r" before half of a group of flies is killed. You and I can take only 400 "r." What is the difference between the fruitfly and us in that regard?

Senator HICKENLOOPER. I have a couple of dimes here, one of which I think was put in the atomic pile in Oak Ridge in 1946. I wonder if you would test it against your machine.

Dr. WARREN. I would be glad to and find out if it is still active.

Senator HICKENLOOPER. I want to find out which one is active.

The CHAIRMAN. Are there any questions? Mr. Durham?

Mr. DURHAM. Just one question.

Doctor, as Director of this research program at the present time, in this year's official budget it was cut some million and a half dollars or more in the program. I would like to have your reaction also in regard to the contract authorization, which is important, and which was cut some \$3,000,000. I would like to have your comment on that.

At the present time have you personnel which is able to carry out your program entirely as you desire it to be carried out? Are you short or long, or what is your position?

Dr. WARREN. At the present time our position is a position that I regard as a short position. We had asked for this initial sum in order to utilize as many available people as were competent in the field.

You will note, if you look back over our appropriations in biology and medicine, that they have gone up rather sharply in the 3 years of operation. That is due to the fact that this was a brand new field in which we did not have many competent people to work.

For example, when I got interested in this thing in 1925, the effect of radiation on normal tissue, there were only two other people in this

country who had any real interest in what happened to normal tissue, and there was only a handful throughout the world.

That situation, fortunately, has been changed. I had outlined what I had hoped to be a sound, conservative program for the utilization of the best brains that we could find and obtain. I am going to do the very best I can with the appropriation that is apparently going to be made available to us. It will not be as productive in the way of results as the full program would have been, but you can rest assured that we will do everything we possibly can with the facilities that we have available.

Mr. DURHAM. I feel personally that this is a very important program for our own defense as well as for research and protection, and that is why I asked you the question whether or not you would be able to carry out your program as you wished.

Dr. WARREN. I will not be able to carry it out completely as I wished. It means having to hold back on certain aspects of it.

Mr. DURHAM. It is highly important. Thank you very much.

The CHAIRMAN. In line with what Mr. Durham has been talking about, Mr. Borden calls my attention to this line in the Senate committee report:

Curtailement of activity is thus recommended to be made in other fields of Commission operation such as administration, community programs, biology, and medicine—

that is you——

Dr. WARREN. That is right.

The CHAIRMAN (continuing):

physical research, and such aspects of reactor development as are not immediately necessary for national security.

That is a joke line if ever I saw one.

Are there any other questions, gentlemen?

Senator VANDENBERG. Dr. Warren, for personal reasons I have a very keen interest in the fundamental subject to which you are directing your very way great labors. May I ask if the inquiries which you are making with respect to the radiation hazard in connection with atomic energy would not also have a bearing on the yet unanswered question of measuring human resistance to X-ray radiation in normal medical practice?

Dr. WARREN. That is exactly right, Senator, and we have felt that any information we can gain in this general field of radiation, not only helps in the atomic energy programs, but it helps every individual who needs X-ray or radium radiation from the standpoint of medical treatment, it enables us to understand more about the relative safety or the relative risks of those forms of treatment.

It might interest you to know that we are expecting from this work with radiation at the national laboratories that I mentioned—on clinical investigation of cancer—we are expecting a twofold result:

We are hoping to learn more about what we can do for cancer, and we are hoping to learn more, while we are helping the people with cancer, about what happens in normal people or in the noncancerous tissues of people with cancer.

Senator VANDENBERG. It seems to be one of the blank spots in the evolution of medical and surgical protection.

Dr. WARREN. It is, unfortunately, a very blank spot, and because I happen to have been one of the very few interested in it, I have perhaps seen more of the sour effects from radiation, if one might term it that, than the average physician would.

I think it is awfully important in any research project, in any approach to research, to bear in mind that you cannot get results right off. One of the things that impressed me most when I was in Japan in 1945 was to be told by the chairman of their national research council that when it was announced that an atomic bomb had been dropped on Hiroshima, they were asked: "Can you produce an atomic bomb within 6 months?"

Well, you just cannot do that sort of thing. We have got to do now in a slow, painstaking, careful way, starting at the present time or, preferably, starting years ago, to build up the type of knowledge that we will have to utilize in an emergency. When the emergency comes, it is far too late. You do not order your fire apparatus after your fire breaks out.

Mr. DURHAM. Doctor, could you at the present time break down your research facilities in a general way as to what part of your effort at the present time is being used in diagnostic work, treatment, and so on?

Dr. WARREN. Yes; I could give a very rough gage of that.

Mr. DURHAM. That is what I want.

Dr. WARREN. I would say that perhaps one-sixth of our effort is concentrated on protection, the working out of instruments on protection such as the more rugged and simple types of instruments that can be used in the field, and so on, for the protection in the plants.

Mr. DURHAM. That is primarily military.

Dr. WARREN. Military and operational. Then I would say that about one-third is in the basic medical sciences, things that we hope to go into, one or another fact which will fit into the general structure that we have to build.

Then about one-third in biology and one-sixth, somewhat less than one-sixth, into a continuing study—rather, about one-twelfth—into a continuing study of the survivors in Japan. The approximately 100,000 people still alive at Nagasaki and Hiroshima represent the largest body of humans ever subjected to radiation, and they are the only body of humans that have ever been subjected to radiation of this type. Consequently, the cooperation of the Japanese medical profession, the Japanese Government in this has been a great help to us, and we feel that we must learn everything we can from this group.

Then there is about one-twelfth of our activity that goes into the fellowship training program, where we will be able to get people particularly interested to help us work in this brand new field.

Mr. DURHAM. Which one of those fields are you the shortest in at the present time in scientific personnel?

Dr. WARREN. I would say we would probably be shortest in the medical field, but it is very hard to draw a line because you can have a man who is not an M. D., trained in the field of biology, but an excellent chemist whose contributions from the standpoint of biochemistry will be of very real importance in the application to the medical side. Unfortunately, the field is one that you cannot cut into segments very readily. It has to go along more or less as a whole.

It would be a good deal like asking General Patton, when he was driving into Germany, whether he would rather have food for his men, gasoline for his tanks, or ammunition to fire from his tank guns.

Mr. PRICE. Mr. Chairman, I would like to say this: Doctor, you made an interesting statement a moment ago when you said that the chairman of the National Research Council, of Japan, I imagine you meant——

Dr. WARREN. Yes.

Mr. PRICE. Stated to you that he was asked if they could produce an atomic bomb in 6 months. Who asked him that? The military authorities?

Dr. WARREN. That was asked by the military authorities.

Mr. PRICE. That would seem to indicate, then, that the Japanese were not ready to give up at the time the bomb fell. They thought if they could produce a bomb within 6 months, they might have continued. Do you gather that impression?

Dr. WARREN. I think they felt they did not care about loss of life very much. They have different standards, apparently, as to the value of life from ours. They felt if there were any hope of an effective counterattack, that they would want to explore that hope.

Mr. PRICE. In other words, it is pretty conclusive proof that the dropping of those two atomic bombs was the thing that ended the war in Japan?

Dr. WARREN. From the studies I made there in 1945 and 1947, I have absolutely no question that that was the decisive factor in ending the war.

The CHAIRMAN. Doctor, the first time you appeared before our Senate special committee, you were in uniform, were you not?

Dr. WARREN. I was; yes, sir.

The CHAIRMAN. I thought I remembered that.

Dr. WARREN. I served in the Medical Corps of the Navy during the war.

The CHAIRMAN. Doctor, the Senate report of the Appropriations Committee says that in allocating the reductions the Commission is directed to make no change provided in the budget estimate for these programs. By "these programs" they mean processing source and fissionable material and producing weapons. Then they go on to give this line I read before——

Do not curtail your weapons, do not curtail your fissionable or source material, but cut down on administration, community programs, biology and medicine, physical research, and to such aspects of the reactor development as are not immediately necessary for national security.

Of course, that last one is the one that I think really is the pay-off. Do you agree with me that that is a silly statement to lay off or to stop such reactor development as is not immediately necessary for national security?

Dr. WARREN. I do not think, Senator, I would be in a very good position——

The CHAIRMAN. Perhaps I can criticize the thing more vigorously than you can, but do you know of any kind of reactor development that is not related to military security?

Dr. WARREN. I certainly do not, sir.

The CHAIRMAN. Neither do I.

Are there any other questions?

Senator HICKENLOOPER. Doctor, I am still worried about my dimes.

Dr. WARREN. I will take care of that. I thought I would make 20 cents.

Senator HICKENLOOPER. If they are too hot, I may give them to you.

Dr. WARREN. That one is absolutely O. K.

Senator HICKENLOOPER. All right.

Dr. WARREN. The activity has gone out of this one, too. I think you can spend either of them.

Senator HICKENLOOPER. You might try that one.

Senator VANDENBERG. Have you got a British pound you can try that on? [Laughter.]

Dr. WARREN. This one here is the real thing, as you can see. You can see that.

Senator HICKENLOOPER. That was irradiated for a minute.

Dr. WARREN. That is really it.

Senator HICKENLOOPER. If one of these dimes was in it, I think it was only there for about 2 seconds.

Dr. WARREN. On this one you got your full money's worth.

Senator HICKENLOOPER. Thank you.

Mr. DURHAM. Are there any further questions?

Dr. WARREN. I have asked Dr. Alan Gregg, who is the chairman of our Advisory Committee on Biology and Medicine, whose job is to "ride herd" on my division and see that it is doing its job properly, to give to you his views as to how the work of the Commission has been carried out in this field.

I felt it would be helpful, rather than having a witness who might be somewhat prejudiced because of being very deeply engaged in the work, if you could get also the viewpoint of someone who is seeing it from the outside.

Mr. DURHAM. Your statement, Doctor, is that the cooperation of the Commission has been satisfactory?

Dr. WARREN. Absolutely, sir. I could not ask for finer.

Mr. DURHAM. Dr. Gregg.

**STATEMENT OF DR. ALAN GREGG, CHAIRMAN, ADVISORY COMMITTEE ON BIOLOGY AND MEDICINE, UNITED STATES ATOMIC ENERGY COMMISSION, AND DIRECTOR FOR MEDICAL SCIENCES, ROCKEFELLER FOUNDATION**

Dr. GREGG. Gentlemen, I will begin by simply mentioning the other members of the Advisory Committee on Biology and Medicine: There is Dr. Goodpasture, who represents the field of pathology, and who is dean of the school of medicine and professor of pathology at Vanderbilt University; Dr. Baird Hastings, who represents the field of biochemistry; he is professor of biochemistry at the Harvard Medical School; Dr. Joseph T. Wearn, who is professor of medicine at Western Reserve University, Cleveland, Ohio; and Dr. Stakman, who is a professor of plant pathology, the University of Minnesota; Dr. D. W. Bronk, who, before he became president of Johns Hopkins, was a physicist at the University of Pennsylvania; and Dr. Beadle, who is a geneticist at California Institute of Technology. That represents the Committee or the Advisory Council.

Dr. Warren is our executive agent. We have been running a little less than 2 years now.

For the first year we had meetings about every month, most of them in Washington; but very sensibly, as I thought, the Commission arranged for all of us to go to the different installations and see the work on the spot. That has meant two visits to Los Alamos, two visits to Brookhaven, one visit to Berkeley, Hanford, Argonne—that is, Chicago—and Oak Ridge. Is that the lot?

Dr. WARREN. Yes.

Dr. GREGG. Those visits have been awfully helpful because in a sense they have given us pegs to hang our hats on.

We have been at the places. The usual technique is to arrive there, spend all day Friday going over the installation, and being shown what is there, and meeting the persons who are stationed there, and then, Saturday, beginning at 9, we have a meeting which could be held in Washington, but which is held there for convenience, which takes up the various matters on the basis of an agenda provided and supplied by Dr. Warren, and we discuss the various projects that he has, and he gives us reports on things going on in different places.

Now, I want to make some rather broad comments about this whole undertaking in medicine and biology. First of all, I think it is wise for you to realize that this is a peacetime undertaking, and I would underscore both "peace" and "time," and by that I mean it is not subject to wartime stresses and strains, and in a tremendous hurry. Certain things can be done now in the era of peace that would have been, and were, out of the range of the Manhattan project.

Now, the other item is the word "time." I think it is perfectly self-evident, if you will stop for a moment to realize, that when you are talking about long-term results of radiation you have got to have time elapsed in order to find out what the long-term results are.

Now, at the very early stages of the Manhattan project, time was not something you could reach and take off the shelf. You have to wait for time, and some of the studies that the Committee on Biology and Medicine have initiated and is supervising depend in considerable measure on the passage of time, and that is a fact, and it is a very valuable aspect to the work that the committee is supervising.

A good definition of "research work" is that it is a guerrilla warfare on the unknown—it cannot always be what the Germans call "plan-mässig" and GHQ plans.

You suddenly find a lead in research work, and the thing to do is to follow that right up, and you cannot tell exactly where your leads are going to come, and you have to be as alert as possible to meet any opportunity that comes along.

You get as much staff work as you can into it, and then you are very smart if you leave both a certain amount of time and a certain amount of your attention for noticing things which are right in front of your hands and face, but which have not been seen by anybody else.

I will give you an example of that in a minute. One of the significant things of the subject matter of this Commission's work is that it is dangerous stuff, and I would like to point out one rather simple and interesting fact. Many of our best medicines, when taken in too large quantities or large quantities, are poisonous. You can kill a man with digitalis, and in very small quantities it is one of the loveliest drugs that there are.

You can kill a man with morphine or opium, but it is certainly God's own grace to the human race that we can control pain with morphine.

Arsenic is considered universally to be a poison, but in small doses—so-called Fowler solution that is given, and it is used—at one time it was taken more largely than it is taken now to improve the complexion and general tone. And the old English-story about the marvelous complexion of the rat catcher's daughter probably derived from the fact that she was getting just enough arsenic at home to give her the very lovely complexion.

Now, the thing that I was going to refer to was this amazing ability to see what is in front of your hands and face; there is a lovely example of that. Ether, which is used in surgery, in surgical operations, and which has made possible probably more headway for surgeons than any other one which has been discovered, was discovered in 1540, and for 300 years it was considered to be a thing to get drunk on, and a very serious poison if used in large quantities, until some intelligent people noticing that in very small and carefully graduated amounts, ether could remove pain.

Now, what have we got in this field of radiation? I suspect that, first of all, we have got an obligation to look at these products and watch what they are producing. This is in very small quantities, because we know that in very large quantities they are killing; but what will they do in very small quantities?

It is an obligation in a sense because no university can expect at the present time to develop all of the machinery, all of the equipment, and all of the young men able to do this kind of investigative work.

We do know that in small quantities radiation has one effect, which is a word, but the Lord knows how many implications there are to that word. Radiation affects cells that are rapidly producing themselves. There are cells that are very slow in production; there are cells that keep dividing all the time, and rapidly.

Well, we find that this radiation affects these cells that produce that, and you can move off from that directly and say, "Oh, there is a lead for cancer because that is what cancer cells will do," or you can say, "Yes, it is also something which relates to reproductive cells, and there may be an effect from slight amounts of radiation," and we know that there are slight amounts of radiation that cause slight changes in the primary cells; namely, produce mutations or changes in what amounts to the heredity of all succeeding organisms.

Now, I have described those two fields, but this is not all a matter of "perhaps," because already we have got at least three first-rate leads in the application of substances that carry or have been radiated or themselves produce radioactive effects.

Radiocobalt is probably the best substitute for radium itself. Radiophosphorus is an excellent material for treating one of the blood diseases called polycythemia. Radioiodine is a first-rate method of treating one of the forms of cancer; namely, the cancer of the thyroid.

Now, I simply want to point out in general that research work is a little bit comparable, can be compared a little bit to the bank at Monte Carlo. The bank, in the long run, is going to win because it has one number out of every 36 in its favor. Sometimes it loses quite a lot, but not in the long run, because in the long run it wins.

Research is that way. You have a lot of shots that do not come out to your advantage, but if you will keep playing research in biology and medicine you will have winnings that do compare quite favorably, so to speak, or quite directly with what goes on in a gambling institution where one number is always set in your favor; and one of the reasons why that is true is that if a man has the really rather remarkable ability of seeing what is in front of his hands and face, which is really research work in part, and thinking about it productively, if he can do that, and if you set him free to work, I cannot tell you where his work will find application, but it is almost certain to find application, and it is an extraordinarily multiple application. Aid comes from the most unexpected quarters to finish off and cap some other effort.

Really, the contemplation of science at the present time gives one the feeling that it is a mass reaction; that one discovery kicks over something somewhere else, and that in turn kicks over something somewhere, and I think it would be wise for you to regard this proceeding in biology and medicine, first, in competent hands, in the person of Dr. Warren—he has had an excellent training for the job. He has got a real and deep interest, and he has a lovely capacity for handling people without making them mad and getting their enthusiasm and their loyal support.

I think that the committee that you have, with the exception of myself, is pretty well chosen. I do not have a comparable competence in any one of these fields to those of the other men, but you have got a good representation in having someone from medicine, someone from biochemistry, two men, really, from pathology, because that is Dr. Warren's long suit, as well as Dr. Goodpasture's, someone to represent the plant field, someone to represent physics itself, and someone to represent genetics.

Now, we are working on, roughly, a basis of having meetings now every 1 to 2 months—usually now it is nearer every 2 months.

Dr. Warren puts up an agenda to us. We criticize, inquire, inform ourselves. The initiative is his; the responsibility for fitting that into what is going on and for commenting on policy is ours.

I think you have got in the work in biology and medicine the kind of work that could hardly have been done as effectively in wartime as it can be now. It is not primarily concerned with weapon production, but I tell you, gentlemen, it is extremely important because it supplies a protection for the people who are producing the bombs, and I might say that I have never seen any industrial hygiene that was in the same class with it from the point of thoroughness and orderly organization, and it also offers you—what, I cannot promise—but it certainly offers you an extraordinary opportunity to work with substances and forces which we have never known before, to perfectly unpredictable advantages.

They have been unpredictable, but already, in three instances, at least, they have realized satisfactory results.

Senator VANDENBERG. To what extent, Doctor, is private research in X-ray radiation dependent upon the continuation of your operations?

Dr. GREGG. I do not think it is dependent in the sense that without our operation no work in the study of X-ray would take or could take place. I just think very little work would take place.

I think, in other words, that the AEC's work is a constant stimulus and standard for further work in the general field of radiation.

Senator VANDENBERG. And an essential complement of it?

Dr. GREGG. And a very valuable complement, yes.

Senator VANDENBERG. It has been a field in which too much progress has not been made heretofore, is that true?

Dr. GREGG. That is right.

The CHAIRMAN. Any other questions?

Senator HICKENLOOPER. I have none.

Mr. DURHAM. Doctor, I do not accept your apology for your incompetence. I think anyone who has listened here to your lecture this morning—and I so regard it as a lecture, would qualify you.

Dr. GREGG. Thank you. I would rather leave that for you to say than me. [Laughter.]

The CHAIRMAN. Thank you very much indeed, Doctor.

Now, we are going to hear from you, Mr. Volpe?

# **STATEMENT OF JOSEPH VOLPE, JR., GENERAL COUNSEL, UNITED STATES ATOMIC ENERGY COMMISSION**

Mr. VOLPE. Yes, sir.

Mr. Chairman, the purpose of my appearance this morning is to make just brief reference to a few things that have been discussed in the past few weeks, as to which we felt some further comment might be necessary.

Before doing that, I would like to read for the record the correspondence to which Mr. Lilienthal made reference last week in connection with the Eniwetok test.

You may recall that he mentioned an exchange of letters following the test between the Commission and the National Military Establishment, and the President of the United States.

Before reading the correspondence I would like to read an excerpt from the first report of the Secretary of Defense, which report was submitted in 1948.

On page 16 of the report by Secretary Forrestal, the heading is "Summary, Scientific Research, and Development." The excerpt reads as follows:

The Military Liaison Committee, established by the Atomic Energy Act of 1946 to provide a working partnership between the armed forces and the Atomic Energy Commission in connection with utilization of nuclear energy for military purposes was reorganized in April 1948 to provide a civilian chairman. Dr. Donald F. Carpenter became the first chairman of the reorganized committee and when later made Chairman of the Munitions Board was succeeded by Mr. William Webster. The Committee, augmented by civilians prominent in science and industry, also serves as a committee of the Research and Development Board with broad authority delegated to it by that Board in the field of research and development.

I want to record my personal satisfaction with the existing statute governing matters in the field of atomic energy, and to express my pleasure, also, at the way in which relationships between the National Military Establishment and the Atomic Energy Commission are being conducted.

This is from a report by the late Secretary of Defense, Mr. Forrestal.

Following the Eniwetok tests, Mr. Lilienthal wrote General Hull as follows:

No formal expression of admiration for your noteworthy achievement as Chief of Joint Task Force 7 will suffice to tell you how proud and deeply gratified I am to have been associated with a man who has served humanity as ably as you have in the operations now concluded. Your poise, generosity, and great human understanding have impressed us all, and your leadership put us all in your debt.

With esteem, I remain,  
Faithfully,

DAVID E. LILIENTHAL.

That was on May 17, 1948.

On May 28, 1948, General Hull wrote Mr. Lilienthal as follows:

MY DEAR MR. LILIENTHAL: Your nice note of May 17 has just reached me, and I find it difficult to express in words my appreciation for it. I am indeed happy to feel that our efforts at Eniwetok have met with your approval.

The success of Operation Sandstone was due to the individual efforts of all concerned. I have never been associated with a finer group of people than those connected with this operation. The support we received from everyone in this operation, and particularly the Atomic Energy Commission, left nothing to be desired. You leaned over backward to meet our every request and I want you to know that, along with everyone else in the task force, I deeply appreciate your support.

With kindest personal regards,  
Sincerely,

J. E. HULL,  
*Lieutenant General, USA, Commanding, Task Force.*

On May 18, 1948, there was a communication from the Secretary of Defense to the Commanding General of the Task Force at Eniwetok.

The following message has been received today from the President of the United States:

"The Atomic Energy Commission has reported to me on the results of the tests of atomic weapons at the Commission's Eniwetok Proving Ground. The Chairman and members of the Commission join me in congratulations to you on the work of Joint Task Force 7 which carried out the tests for the Commission. The successful completion of this mission is an outstanding example of an integrated operation by the agencies responsible for the military defense of the Nation and those responsible for the scientific and technical development of the means and defense. Please convey to the Commander of Joint Task Force 7 and to all of the members of the National Military Establishment who contributed to the success of the undertaking my commendation for a job well done. I know you share my feelings of gratification for the accomplishments of the Commission's Los Alamos Scientific Laboratory as indicated by the results of the test program. I have asked the Commission to convey my commendation to all of the civilian personnel involved both in the development work leading up to these tests and in the actual conduct of the proof-test program."

That is the end of the quotation from the message of the President. Mr. Forrestal went on:

My congratulations to all who contributed to the successful execution of this difficult operation.

On June 18, 1948, the Secretary of Defense wrote Mr. Lilienthal, as follows:

DEAR MR. LILIENTHAL: I am forwarding to you herewith a list by name of certain members of the scientific group participating in Operation Sandstone who did outstanding work in the view of the Task Force Commander. In the case of personnel of the military services there are standard and easily applied methods of recognition including decorations, if warranted, for those individuals who perform especially outstanding services in operations of the nature of Sandstone. However, there appears to be no method available to the military in peacetime of

providing comparable recognition to the civilian scientists who served in the task force under the auspices of the Atomic Energy Commission.

The Task Force Commander has recommended that I forward this list of names to you for whatever action the Atomic Energy Commission may wish to take in recognizing the services they have performed. I am happy to do this and I feel that it is especially fitting that the outstanding work performed by these individuals during the atomic bomb tests at Eniwetok be recognized.

These gentlemen have performed in an outstanding manner an important service to our Nation. The military services have been privileged to be associated with them and on behalf of the Department of Defense I wish to extend to each of them a "well done."

Sincerely,

(Signed) JAMES FORRESTAL.

There was attached to this letter a list of 26 personnel from the Los Alamos Laboratory and other laboratories who participated in the tests.

On June 28, 1948, Mr. Lilienthal wrote Secretary Forrestal:

DEAR MR. SECRETARY: It is particularly pleasing to note the recognition accorded certain members of the scientific group of Joint Task Force 7 in your letter of the 18th of June.

The outstanding manner in which these individuals contributed to the success of the 1948 atomic weapon test program at Eniwetok Atoll has now been recognized by commendatory letters from the Atomic Energy Commission to each of the individuals.

Please accept again the Commission's grateful appreciation for the superb task done in the national interest by the Commander of Joint Task Force 7, Lt. Gen. John E. Hull, USA. His broad understanding, his wisdom, patience, ability, and energy made the operation a success. To conduct an operation of the magnitude of Sandstone on such short notice, yet with such thorough planning and such painstaking execution, was indeed a monumental task.

Sincerely yours,

UNITED STATES ATOMIC ENERGY COMMISSION,  
DAVID E. LILIENTHAL, *Chairman*.

The final letter was written by Mr. Lilienthal on July 2, 1948:

DEAR MR. SECRETARY: The United States Atomic Energy Commission wishes to express its great appreciation for the major role of the National Military Establishment in the construction of the proving ground at Eniwetok Atoll and in the execution of the 1948 atomic weapon proof tests.

The support of the Military Establishment was effective and complete. The success of the test program was in large part due to the unselfish devotion to duty of the officers, civilian technicians, and enlisted men of the armed forces.

The Commission is particularly grateful to the Commander of Joint Task Force 7, Lt. Gen. John E. Hull. General Hull's sound judgment, patience and understanding have done much to bring closer together the scientific and military interests of the Nation.

While the magnitude and complexity of Operation Sandstone prevent mentioning all the units and agencies of the armed forces which contributed to the noteworthy success of the tests, the Commission desires to cite certain organizations which worked particularly closely with the scientific group in the performance of experiments.

The United States Army, in addition to the significant contribution of its construction forces, assisted the scientific group from the Los Alamos Laboratory in experimentation by providing highly qualified technical personnel from the Ballistics Research Laboratory at Aberdeen. The Aberdeen Proving Ground also assisted by designing, building, and operating drone tank equipment.

The United States Navy provided well-equipped laboratory ships. A particularly helpful contribution to the scientific group was the loan of scientific and technical personnel from the Naval Research Laboratory, the Naval Ordnance Laboratory, and the David Taylor Model Basin. The operations of the Naval Research Laboratory group were particularly outstanding and are deserving of special mention.

The United States Air Force performed, with outstanding success, a valuable function for the scientific group in the collection of samples. The first experimental guided missiles group established new records of efficiency in the accomplishment of a difficult operation.

The armed forces "Special Weapons" project provided technicians who rendered valuable assistance in the experimentation and command, staff, and technical personnel for the important and highly successful organization responsible for radiological safety.

The success of this joint venture is a reassurance that our two agencies have established the basis for greater mutual assistance and cooperation in the advancement of our national security.

Sincerely yours,

UNITED STATES ATOMIC ENERGY COMMISSION,  
DAVID E. LILIENTHAL, *Chairman*.

Mr. Chairman, we took time to read these letters this morning because the joint operation of the United States Atomic Energy Commission and the National Military Establishment in carrying out the 1948 atomic weapons' test is an outstanding example of how a civilian agency may work closely and in cooperation with the National Military Establishment.

Last Friday, I asked permission of the committee to insert for the record certain statements by members of the Commission's organization. I explained at that time that the purpose of the statements was to save the time of having witnesses appear to read them and discuss them at length.

With the committee's permission, I would like to insert at the close of the record this morning a statement by Walter J. Williams, Director of Production entitled "The Atomic Energy Commission Production Program, 1947-1949"; a statement on the research program by Kenneth S. Pitzer, the Commission's Director of Research; and a statement by Paul M. Green, the Commission's Controller, on financial management; and, finally, two statements by Mr. Carroll L. Wilson, General Manager, one on the Commission policy and organization, and the other on meetings of the Atomic Energy Commission and the means by which the Commission keeps informed of activities and maintains effective direction of the program.

There may be, in addition to these statements, one or two more which were not ready this morning. I would ask permission that these be inserted at some appropriate place in the record, perhaps tomorrow or the day after.

(The data referred to above are marked "Exhibit 32" and will be found in the appendix.)

MR. PRICE. Mr. Chairman?

THE CHAIRMAN. Mr. Price.

MR. PRICE. Right at this point I would like to ask permission to include in the record sections of the first report of the Secretary of Defense, one headed "Military Liaison Committee" from page 51 to page 54; and the section headed "Special weapons" on page 54 to the middle of page 56.

THE CHAIRMAN. So ordered.

(The data referred to above are marked "Exhibit 34" and will be found in the appendix.)

THE CHAIRMAN. Does that conclude your remarks?

MR. VOLPE. It does not, sir; I have just a few more items.

In the course of these hearings questions have been raised about the Commission's legal authority to grant emergency clearances. These questions have been raised frequently at times when it seemed not appropriate to take up the question at that time.

In August of 1947, during a Commission visit to Hanford—I was present with the Commission—the General Electric Co. took up with

the Commission what was then a very urgent and serious problem. That was the necessity for getting certain projects under way immediately. They were troubled at the time by what seemed to them provisions of the law which might delay their undertaking this work.

At that time they wanted to bring in immediately—as a matter of fact, they indicated that these people should have been brought in weeks before—some 23 people for the purpose of discussing with them very urgent work that needed to be done at Hanford.

We went over with them at the time the provisions of the law which, it seemed to us, would make it possible for the General Electric Co. to do everything that needed to be done in order to carry on these urgent projects.

Before discussing the provisions of the law, I might say just a word about the nature of the emergency clearance. I cannot emphasize too strongly that by “emergency clearance” we do not mean that we bring into the atomic energy program an individual about whom we know nothing, an individual about whom we have to accept, perhaps, only on his own word. These individuals are brought in on emergency clearance only after submission of a detailed personnel security questionnaire, and only after submission of a fingerprint card, and then only after the questionnaire is thoroughly scrutinized and a check is made in the FBI files.

I think it is relevant in that regard to point out that although approximately 4,000 emergency clearances were given, in only one case did information turn up after a full FBI investigation which involved what we might term substantial evidence of membership or close association in the Communist Party.

The provisions of the act, of course, are well known to this committee, but I believe that a few sections need to be read and discussed.

Section 10 (b) (5) (B) (ii) read as follows:

Except as authorized by the Commission in case of emergency, no individual shall be employed by the Commission until the Federal Bureau of Investigation shall have made an investigation and report to the Commission on the character, associations, and loyalty of such individual.

Section 10 (b) (5) (B) (i) reads as follows:

No arrangement shall be made under section 3, no contract shall be made or continued in effect under section 4, and no license shall be issued under section 4 (e) or 7 unless the person with whom such arrangement is made, the contractor or prospective contractor, or the prospective licensee agrees in writing not to permit any individual to have access to restricted data until the Federal Bureau of Investigation shall have made an investigation and report to the Commission on the character, associations, and loyalty of such individual and the Commission shall have determined that permitting such person to have access to restricted data will not endanger the common defense or security.

Then, section 10 (b) (5) (B) (iii), provides:

Notwithstanding the provisions of subparagraphs (i) and (ii), during such period of time after the enactment of this act as may be necessary to make the investigation, report, and determination required by such paragraphs, (a) any individual who was permitted access to restricted data by the Manhattan Engineer District may be permitted access to restricted data and (b) the Commission may employ any individual who was employed by the Manhattan Engineer District.

Section 1 (a) of the act, in part, reads as follows:

Findings and declaration:

It is hereby declared to be the policy of the people of the United States that, subject at all times to the paramount objective of assuring the common defense and security, the development and utilization of atomic energy shall, so far as

practicable, be directed toward improving the public welfare, increasing the standard of living, strengthening free competition in private enterprise, and promoting world peace.

Section 10 (a) of the act, reads as follows:

Control of information. Section 10 (a) policy:

It shall be the policy of the Commission to control the dissemination of restricted data in such a manner as to assure the common defense and security.

When faced with the questions raised by the General Electric Co. at Hanford, and having in mind also the problems of contractors and the Commission at, perhaps, all of the Commission's installations at that time, we sought to interpret the provisions of section 10 to determine whether they constituted a flat prohibition for the granting of emergency clearances for contractor personnel.

Section 10 (b) (5) (B) (i) does not provide that the Commission shall not give a clearance or permit an individual to go to work prior to an FBI report, but prohibits a contractor from giving access to restricted data unless certain things are done.

As a matter of fact, in section 10 there is a very clear recognition on the part of the Congress that considering the nature of the program, the urgency of the job to be done, that it would probably, under certain circumstances, not be possible to first have a full FBI investigation and clearance of all individuals before they might be permitted to go to work.

It was our view that in the absence of a flat prohibition, and considering all of the other relevant and pertinent provisions of the act, that the overriding consideration—again in the absence of the flat prohibition—the overriding consideration was the declared policy of the Congress that the Commission should conduct its affairs in such a way as to assure the common defense and security.

On September 19, we discussed this matter with the Attorney General of the United States. We canvassed very carefully with the Attorney General and his assistants the various provisions of the law which might be relevant to a solution of this question. We also discussed with him the problems which the Commission faced.

Mr. Lilienthal, the Chairman of the Commission, attended that meeting. The Attorney General agreed immediately that from his reading of the law, the Congress did not intend that everyone be investigated by the FBI and cleared by the Commission before work could be undertaken. He recognized immediately that the problem which faced us was one whether we should jeopardize by delay the common defense and security of the United States by providing for a full FBI investigation and clearance of all individuals.

As a matter of fact, one assistant remarked, that the Congress could not possibly have thought that the Commission should direct its attention at FBI investigations and clearance of all individuals and forget about the need for getting jobs done.

Thereafter, I discussed the question of interpretation of the act with Senator Hickenlooper, the then chairman of the Joint Committee on Atomic Energy. In our discussion I set forth all of the reasons why the Commission had interpreted the law as it did, and also explained the views of the Attorney General of the United States.

At the time, I must say, I left with the impression that there was not any serious disagreement on the question of legal interpretation of section 10. This, we must recall, was in 1947, and I would say for

my own part, that if there had been any serious disagreement or if a serious question had been raised about the Commission's authority to grant emergency clearances, I am certain that the staff would not have advised, and I am sure the Commission would not have seen fit, to proceed without a very careful examination and discussion of the matter with the Joint Committee on Atomic Energy.

This, Mr. Chairman, concludes my point on emergency clearances.

Mr. Hinshaw raised a few weeks ago three questions regarding the Commission's contract for natural gas. The first question he raised was the applicability or relevancy of the Panhandle case recently decided by the United States Supreme Court, the relevancy of that case to the Commission's contract for natural gas at Oak Ridge.

The second question he raised was a matter of the availability of gas and what, if anything, the Commission did to satisfy itself that an adequate supply of gas would be available for Oak Ridge.

The third point he raised, was with respect to the rights of the Commission in the event of breach of contract by the supplier.

The Natural Gas case, or the so-called Panhandle case, which was recently decided by the Supreme Court—

The CHAIRMAN. Can you cover these by way of a memorandum?

Mr. VOLPE. I would be very happy to do so.

(The data referred to above are marked "Exhibit 35" and will be found in the appendix.)

The CHAIRMAN. I would appreciate it if you would.

Is there anything else?

Mr. VOLPE. That is all.

The CHAIRMAN. Are there any questions?

Senator HICKENLOOPER. I would just like to discuss with Mr. Volpe for a moment the question of emergency clearances.

I remember the discussion in 1947, but my recollection of the discussion was that it went entirely to cases of emergency, where some emergent situation came up, and the Commission would find it necessary to get in some noted scientist or some noted specialist to discuss that particular situation, see if a solution would come up for it, and I was in agreement that under the provision of section 10, which starts out "except as authorized by the Commission in the case of emergency"—I was of the opinion, and I think I so agreed at that time, that there were situations where that would arise, where the law had recognized that emergent situations would arise, where the Commission would be authorized to do that, and where 90 days could not possibly be allowed to elapse before the benefit of this specialized judgment could be brought to a certain problem.

There was no discussion or contemplation at that time, as I recall it, about the wholesale policy of just hiring anybody and everything under the so-called emergency clearances.

I think there was a problem discussed at that time involving some technical things of which I knew nothing—I mean I was not capable of discussing any technical things—but there were some immediate technical problems. As I recall it you said, Mr. Volpe, "Now, what about a situation like this? Here is a situation."

I said, "I think the Commission has a right, under the law in such a situation, to clear as an emergency an outstanding authority on this particular thing to meet the problem."

I think that is what the problem was, but there was no discussion, as I recall it, about the idea of clearing over 4,000 in 2 years, ranging all the way through the operational activities of the Commission; and, certainly, it is my opinion—I do not care to argue the legal points of it at the moment—that the law is completely prohibitive except in the cases of actual emergent situations which arise and which must have immediate answers and immediate consultation with able people.

Now, there are letters in the files on this matter, in which I wrote to Mr. Lilienthal, as Chairman of the Commission, on two or three occasions. I cannot just recall the number of times; I would have to get into the joint committee's files to get those copies, in which I have said:

Is there anything burdensome or unworkable about this law and about the clearances? Because if the clearance situation is an unworkable situation, then let's change the law; let's don't violate the law.

That was the connotation of the letter, "let's don't take the law into our own hands; let's change the statute if there is a burdensome or difficult situation."

Each time I received a letter back saying, "No, there are some delays but we don't advocate any change in the law. We don't want any change in the policy."

Therefore, I assumed that if it were burdensome in some cases, nevertheless the Commission would elect to live under it.

It was only sometime last year when I began to check into what policies had been followed in emergency clearances that I found this consistent, month-by-month pattern of what I sincerely believed to be a complete avoidance of the law, and an operation without regard to, what I think, are the very stringent limitations of the statute, and I believe the debates on the floor of the House and Senate will indicate that that was one of the important, basically important, things: it was the most tight inspection and examination and investigation of people who were to have access to restricted data, and that that was the intent of the Members as expressed in the debates on the floor of the Congress as well as of the special committee, at least in the Senate, which wrote the law.

Now, that is my philosophy on that, and I do not disagree with you. I agree with you that we discussed certain vital emergent situations, and we discussed this particular provision of the law, and I said, "Yes, in these particular situations I think the Commission is justified in bringing in the best possible expert in that field who can be brought in here, and I think that is exactly what that provision of law was meant to do."

Mr. VOLPE. Well, Senator Hickenlooper, I think this has served to clarify the point. You are absolutely right about the discussion we had. I think it is evident now, as it was to both of us then, that the question here is not the question of legal authority, but rather the question of the application of that authority, and the question of administration. However, I do not intend this morning to deal with the question of whether or not 4,000 or approximately 4,000 emergency clearances were necessary. I would merely mention that out of 136,000 investigations which were conducted, 4,000 appears to be a fairly reasonable number.

The reasons for the rather sizable number, as you believe it to be, of emergency clearances were advanced by the Chairman of the Commission; they were discussed the other day by General McCormack and Captain Russell. I am gratified, however, that we have clarified the question which has been raised. I had feared that the question which had been raised was the question of legal authority.

Senator HICKENLOOPER. It is; it is utterly. It is a question of legal authority. I take the position that you have no legal authority for the wholesale clearances of various, what we might call, run-of-the-mill technicians, as well as highly trained scientists who were just going to work on a job, as a job, in the Commission.

I think that the only legal authority that is contained in the act is where a situation of genuine emergency has occurred.

Mr. VOLPE. Yes.

Senator HICKENLOOPER. Where there is some vital immediate thing that needs attention.

Mr. VOLPE. Yes, sir.

Senator HICKENLOOPER. I have always contended that the law specifically recognized that in that particular language, but it not only does not recognize the right for continuous month-by-month-by-month operation, as the pattern shows, from 112 to 180 people each month being given emergency clearance with access to restricted data—personally, it is my belief that that is in violation, not only of the spirit but of the letter of the law.

Now, if that is an unworkable situation in the law, I again say, as I have said before in writing, and I think you said you recalled the letters to this effect—

Mr. VOLPE. That is right.

Senator HICKENLOOPER. I again say that the law ought to be changed, and the method ought to be worked out whereby a satisfactory employment policy should be and could be adopted rather than have the Commission under the guise of its secrecy and its autonomy undertake to take the law into its own hands and interpret it as it pleases to fit its own convenience.

Now, that is just my philosophy.

Mr. VOLPE. Senator Hickenlooper, all I meant to say was that my recollection is that at the time of our discussion we were agreed that in cases of emergency, in cases where things needed to be urgently done, authority existed for granting emergency clearance.

I believe your quarrel with the Commission is on the question of what is an emergency, and that is a point which I have already said I believe has been covered.

Senator HICKENLOOPER. I again want to point out that the language of the statute is not in cases of emergency. It is in case of emergency, which, I believe, has a different connotation than if we had used the language "in cases of emergency." That may be a highly technical discussion, but probably it would have some influence on a legal decision in the matter.

The CHAIRMAN. Are you through, Mr. Volpe?

Mr. VOLPE. Yes, sir.

The CHAIRMAN. At this point in the record we will insert the records referred to previously by Mr. Volpe.

(The data referred to above are marked "Exhibit 32" and will be found in the appendix.)

The CHAIRMAN. Now, we have had 22 open hearings; we have had 14 hearings in executive session, for a total of 36.

This, unfortunately, does not conclude the investigation. I say "unfortunately," because it would be well if we could be through with it, but it does not conclude the investigation. However, we do hope to conclude it as speedily as possible.

I have advised the other members of the committee that I wish to hear as speedily as possible from them as to any witnesses that they think ought to be called in in either open or closed hearings, and to date I have received no response.

We have the personnel security cases, and I have scheduled an executive meeting for tomorrow afternoon to begin discussion, at least, of how they are to be handled.

So, if there is nothing further, we will recess this hearing at the call of the Chair.

(Whereupon, at 12:35 p. m., the joint committee adjourned, subject to the call of the Chair.)

## SCHEDULE OF EXHIBITS

### APPENDIX 1

Number and subject of exhibits	Introduced at page—	Appears on page—
1. Summary of Atomic Energy Commission Federal personnel separations, calendar years 1947 and 1948-----	91	902
2. Regulations governing handling of fissionable materials at Argonne National Laboratory requested by Senator Knowland-----	92	903
Security responsibilities for the temporary site-----		903
Bulletin GM-76, issued March 10, 1948, governing allocation and transfer of fissionable materials outside of routine production channels-----		905
Bulletin GM-95, issued July 23, 1948, governing accounting for source and fissionable materials-----		907
Allocation and transfer of fissionable materials, December 7, 1948-----		907
Identification of Argonne National Laboratory documents and forms, June 7, 1948-----		923
3. Summary of Manhattan Engineer District Federal personnel separations, 1945 and 1946-----	100	928
4. Summary report of emergency clearances granted by AEC for 1947, 1948, and January to March 1949-----	{ 106 127 }	928
5. Delineation of standards by which area managers are authorized to grant emergency clearances-----	126	934
Internal Administrative Order No. 13—Personnel Employment-----		934
Internal Administrative Order No. 16—Personnel Employment-----		934
Internal Administrative Order No. 19—Personnel Employment-----		934
Delegation of authority to grant emergency clearances for contractor personnel, General Manager to Director of Security and Intelligence, April 23, 1948-----		935
Bulletin GM-101—Decentralization of Authority to Grant Temporary Security Clearances Under Emergency Conditions-----		936

## SCHEDULE OF EXHIBITS—Continued

## APPENDIX 1—Continued

Number and subject of exhibits	Introduced at page—	Appears on page—
6. Certain aspects of emergency clearances for access to restricted data granted by the AEC between January 1, 1947, and May 31, 1949.....	127	942
Emergency clearances granted to prospective contractors or to official visitors requiring access to restricted data.....		942
Cases in which, after emergency clearances were granted, information having derogatory implications was developed in the full FBI investigation, and on the basis of such information, involuntary termination of employment on AEC work occurred.....		943
Cases in which emergency clearances were granted and in which the person being investigated by the FBI voluntarily terminated employment on AEC work before completion of the full FBI investigation.....		943
7. Record of cooperation between the armed forces and the AEC during the Eniwetok tests.....	128	944
8. Answers to questions regarding security at Argonne National Laboratory submitted by James R. Yore, Chicago AEC security officer.....	165	946
9. Materials describing authority, responsibility, and general procedures in connection with personnel clearances.....	196	947
Bulletin GM-80—Decentralization of Authority To Grant Personnel Clearances and of Control of Investigative Reports, March 30, 1948.....		948
Bulletin GM-80 (revised), June 17, 1948.....		953
Bulletin GM-85—Elimination of Temporary Security Approval ("S") for Employment by the AEC, May 26, 1948.....		958
Bulletin GM-101—Decentralization of Authority To Grant Temporary Emergency Clearances Under Emergency Conditions, July 29, 1948.....		959
Bulletin GM-102—Decentralization of Authority To Reinstate Personnel Security Clearance of Former Employees, July 29, 1948.....		965
Personnel security clearance criteria for determining eligibility.....		966
Submission of requests for FBI investigations and for special central file and fingerprint searches, Director of Security and Intelligence to managers of operations and area managers, April 20, 1948.....		969
Supplement to instructions for processing requests for clearances and notifications of terminations of employees, Director of Security and Intelligence to Assistant General Manager, May 24, 1948.....		970
Processing of "QE" and "QP" investigations for submission to FBI, August 10, 1948.....		973
Transmittal of clearance requests to the Federal Bureau of Investigation—AEC announcement for managers of operations, October 1, 1948.....		973
Procedure regarding transfers and reinstatements, November 30, 1948.....		975
10. Development and operation of AEC personnel security program.....	197	976

SCHEDULE OF EXHIBITS—Continued

APPENDIX 1—Continued

Number and subject of exhibits	Intro- duced at page—	Appears on page—
11. Memorandum regarding security at certain construction areas at Argonne National Laboratory.....	197	985
Memorandum to all guards at Argonne National Laboratory regarding persons allowed unlimited access to property.....		985
Guards duties during working hours.....		988
Guards duties during nonworking hours.....		988
12. Radioisotopes for international distribution; catalog and price list, September 1949.....	239	989
13. Foreign distribution of isotopes.....	264	996
14. Foreign distribution of isotopes (memorandum for information by General Manager, October 10, 1947).....	271	999
15. 234-5 project costs.....	347	1001
16. AEC action in connection with report on natural gas pipe line at Oak Ridge, by subcommittee to Joint Committee on Atomic Energy.....	{ 457 476 }	1001
17. Extracts from AEC General Manager's bulletins requested by Senator Millikin.....	546	1004
18. Commercial bid form and invitation to bid for local newspaper at Richland, Wash.....	565	1005
19. Salary data (contractor personnel receiving \$14,000 or more per year reimbursed by AEC).....	606	1017
20. Correspondence by and with Richland Plumbing & Heating Co. with respect to operations at Richland, Wash.....	{ 626 636 }	1019
21. Analysis of payments to Zia Co., May 1, 1946, through May 31, 1949.....	676	1039
22. Total investment in housing at Oak Ridge.....	680	1040
23. Supervisory fee received by Roane-Anderson Co. under Modification 20 of contract.....	686	1040
24. Information concerning firmness of supply of natural gas to Oak Ridge.....	709	1040
25. List of firms conducting management surveys for AEC.....	751	1043
Oak Ridge operations office surveys as of June 30, 1949.....		1043
Santa Fe operations office surveys, January 1, 1947, to June 30, 1949.....		1046
Hanford operations office surveys, January 1, 1947, to June 30, 1949.....		1046
New York operations office surveys, January 1, 1947, to June 30, 1949.....		1048
Chicago operations office surveys, May 13, 1948, to June 30, 1948.....		1048
26. Salary data of employees of AEC and its contractors receiving \$10,000 but less than \$14,000 per year.....	751	1049
Employees of AEC and its contractors receiving more than \$14,000 per year.....		1049
27. AEC fellows failing to return non-Communist oath required for fellowship award.....	751	1050
28. Cost of maintenance and operation of rail facilities operated at Oak Ridge by Southern Railroad and Louisville & Nashville Railroad.....	755	1050
29. List of surveys and studies for Washington office and raw materials operations.....	756	1053

## SCHEDULE OF EXHIBITS—Continued

## APPENDIX 1—Continued

Number and subject of exhibits	Intro- duced at page—	Appears on page—
30. Official travel time and itinerary of David E. Lilienthal, Chairman, Atomic Energy Commission, January 1947 to June 30, 1949.....	756	1056
31. Salary data (revised) of employees and its contractors who receive payments of \$10,000 to \$14,000 per year..... Employees who receive salaries of \$8,500 to \$10,000 per year.....	832	1061 1068
32. Dissenting votes recorded in Commission minutes..... Means by which Commission keeps informed on activities and maintains effective direction of atomic energy program; statement by General Manager Carroll L. Wilson..... Production program; statement by Walter J. Williams, Director of Production..... Security program, 1947-49; statement by General Manager Carroll L. Wilson..... Research program; statement by Kenneth S. Pitzer, Director of Research..... Financial management; statement by Paul M. Green, controller..... Views on conducting Commission business; statement by General Manager Carroll L. Wilson..... Fellowship program; statement from AEC General Advisory Committee.....	873	1070 1071 1073 1079 1082 1085 1087 1090
33. Medical effects of atomic bomb explosions; statement by Dr. Shields Warren, M. D., Director, AEC Division of Biology and Medicine.....	877	1091
34. AEC Military Liaison Committee; excerpts from First Report of the Secretary of Defense, National Military Establishment, 1948.....	894	1095
35. Articles from AEC contract with East Tennessee Natural Gas Co., which set out obligations of the gas company to deliver natural gas to Oak Ridge.....	897	1098

## APPENDIX 2

Letter from David E. Lilienthal, Chairman, Atomic Energy Commission, to Senator Brien McMahon, Chairman, Joint Committee on Atomic Energy, regarding—	Page
Investigation of Senator Hickenlooper's charges of "incredible mismanagement," dated May 25, 1949.....	1100
Transmission to the joint committee of FBI investigative reports on most of the individuals listed by Senator Hickenlooper, dated June 4, 1949.....	1101
Reference to "Case A" by Senator Hickenlooper, dated June 6, 1949.....	1103
Lack of adequate notification to the Commission of the nature of the charges being brought against it, dated June 14, 1949.....	1104
Appearance of Dr. Walter H. Zinn, Director, Argonne National Laboratory, before Joint Committee on Atomic Energy.....	1105

## APPENDIX 3

Letters from—	
Carroll L. Wilson, General Manager, Atomic Energy Commission, to Senator McMahon, regarding Kruger fees, dated July 14, 1949.....	1105
Senator McMahon to Tom J. McGrath, Fuels Research Council, Inc., regarding letter requesting hearing on H. R. 5147, dated July 27, 1949.....	1106

Letters from—Continued

Tom J. McGrath, Fuels Research Council, Inc., to Senator McMahon, requesting hearing on H. R. 5147, dated July 20, 1949-----	Page 1106
Frank R. Creedon to Senator McMahon, regarding references to writer at hearings before Joint Committee on Atomic Energy on investigation into Atomic Energy Commission (with attachments), dated August 30, 1949-----	1107
J W. Elmore, Jr., mayor, Knoxville, Tenn., to Senator McMahon, transmitting resolution of Knoxville City Council commending David E. Lilienthal (resolution attached), dated August 31, 1949-----	1110
Press release regarding—	
Lost uranium at Argonne National Laboratory; from office of Senator McMahon, May 18, 1949-----	1111
Lost uranium at Argonne National Laboratory and case of Hans Freistadt, AEC fellow; from office of Senator McMahon, May 19, 1949-----	1112
Charges of incredible mismanagement and resignation of David E. Lilienthal; from office of Senator Hickenlooper, May 22, 1949-----	1112
Reply by David E. Lilienthal to Senator Hickenlooper's charges on May 22, 1949; from Atomic Energy Commission, May 22, 1949-----	1112
Appointment of Dr. Ernest Thiele, assistant director of research, Standard Oil Co. of Indiana, as special consultant to Joint Committee on Atomic Energy in matter of lost uranium at Argonne National Laboratory; from office of Senator McMahon, May 25, 1949-----	1114
Letters to Secretary of Defense from Senator McMahon (and reply thereto) regarding allegations that armed forces desire military control of atomic energy, June 2 and 6, 1949-----	1114, 1115
Letter from Dr. E. U. Condon, Director, Bureau of Standards, to Senator McMahon, regarding appearance before Joint Committee on Atomic Energy on matter of his clearance by AEC, June 8, 1949-----	1115
Letter from Senator McMahon to Secretary of Defense (and reply thereto) regarding photographs of atomic energy installations contained in certain publications, June 14 and 21, 1949-----	1116
Press release concerning costs of a facility constructed at Hanford, from Atomic Energy Commission, June 14, 1949-----	1117
Statement by Senator McMahon regarding—	
Discussion of article in Nation's Business, June 1949, by William B. Huie, June 17, 1949-----	1118
Uranium inventory at Oak Ridge, June 23, 1949-----	1119
Report by Dr. Ernest Thiele, consultant to Joint Committee on Atomic Energy on matter of lost uranium at Argonne National Laboratory, July 11, 1949-----	1119
Termination of hearings by Joint Committee on Atomic Energy on investigation into Atomic Energy Commission, August 25, 1949-----	1120

APPENDIX 4

Analysis of press and radio statements regarding the issues involved in the investigation into the policies and administration of the United States Atomic Energy Commission, May 7 through July 31, 1949-----	1121
Analysis of correspondence received by the Joint Committee on Atomic Energy regarding the investigation into the policies and administration of the Atomic Energy Commission, May 12-July 31, 1949-----	1174
Distribution of letters received by the Joint Committee on Atomic Energy (by States and percentages)-----	1174

APPENDIX 5

Report and appraisal of the Carmichael School, Richland, Wash., to the Joint Committee on Atomic Energy (prepared by Ernest J. Kump and Mark Falk, consulting architect and engineer, San Francisco, Calif., August 6, 1949)-----	1174
Letter from—	
William L. Borden, executive director, Joint Committee on Atomic Energy, to Carroll L. Wilson, General Manager, Atomic Energy Commission, transmitting copy of Carmichael School report, dated August 19, 1949-----	1202

	Page
Letter from—Continued	
Carroll L. Wilson, General Manager, Atomic Energy Commission, to William L. Borden, executive director, Joint Committee on Atomic Energy, commenting on report on Carmichael School, dated September 13, 1949.....	1202
Carroll L. Wilson, General Manager, Atomic Energy Commission, to William L. Borden, executive director, Joint Committee on Atomic Energy, transmitting letters from General Electric Co. regarding Carmichael School report, dated September 13, 1949.....	1204
Turnbull, Graham, Anderson, Probst & White to G. R. Prout, general manager, General Electric Co., Richland, Wash., regarding qualifications of architect-engineer firms engaged in construction of Carmichael School, dated August 30, 1949.....	1204
Comments on Carmichael School report by F. K. McCune, assistant general manager, General Electric Co., Hanford engineer works; letter to AEC, Hanford operations office, Richland, Wash., dated August 29, 1949.....	1205
Letter from—	
Turnbull, Graham, Anderson, Probst & White to G. R. Prout, commenting on Carmichael School report, dated August 26, 1949.....	1209
Superintendent, community activities division, Richland, Wash., to assistant general manager, Hanford works, regarding public school construction, dated August 26, 1949.....	1211
Chronological history of the recommendations received from the State Department of Education, State of Washington, regarding the construction of the Robert Gray Junior High School (renamed Carmichael School), dated August 15, 1949.....	1211
Letter from P. A. Wright, superintendent, Richland Public Schools, to C. F. Barnes, community activities superintendent, Richland, Wash., concerning satisfaction with Carmichael School, dated August 26, 1949.....	1212

<sup>1</sup> Revised.<sup>2</sup> Includes 893 persons transferred to AEC contractors.<sup>3</sup> Includes 164 persons transferred to AEC contractors.

NOTE.—Symbol (A) indicates average; (T) indicates total; (AR) indicates annual rate.

NOTE.—These figures do not include consultants retained on a personal service contract basis. The figures may include a certain number of temporary employees, but the number is not significant.

## EXHIBIT 2

(See also Exhibits 8 and 11)

(Referred to on p. 92, pt. 2, June 1, 1949)

UNITED STATES ATOMIC ENERGY COMMISSION,  
Washington 25, D. C., June 8, 1949.

Mr. WILLIAM L. BORDEN,  
*Executive Director, Joint Committee on Atomic Energy,  
United States Capitol, Washington 25, D. C.*

DEAR MR. BORDEN: There is forwarded herewith materials in further response to Senator Knowland's request during the June 1 hearing on the subject of the regulations and handling of fissionable materials at Argonne National Laboratory. Those materials classified secret are forwarded by separate letter.

1. GM Bulletin 76 issued March 10, 1948, governing the allocation and transfer of fissionable materials outside of routine production channels and GM Bulletin 95 issued July 23, 1948 governing accounting for source and fissionable material.

2. A report dated December 7, 1948, pursuant to GM Bulletin 76 on the accounting, safety, security, and health measures then in existence. These measures had been in effect for some time, including the period of September 1948, and had gradually evolved from the period of the Manhattan District.

3. Brief explanation of Argonne National Laboratory documents and forms used in handling this particular shipment of material.

The following material is submitted as indicating the documents supposedly covering the particular material in question. Subsequent investigation, however, has disclosed that the bottle in question was erroneously thought to be contained in the carton covered by these documents. It actually remained at Site B as investigation has since disclosed.

1. Special Materials Pass showing material leaving Site B at 2:35 P. M. September 16, 1948.<sup>1</sup>

2. Special Materials Pass showing material arriving at New Chemistry at 2:45 P. M., September 16, 1948.<sup>1</sup>

3. Special Materials Pass showing material leaving New Chemistry at 2:50 P. M., September 16, 1948.<sup>1</sup>

4. Special Materials Pass showing material arriving at Site A at 3:45 P. M., September 16, 1948.<sup>1</sup>

Sincerely yours,

CARROLL L. WILSON,  
*General Manager.*

ARGONNE NATIONAL LABORATORY, November 17, 1948.

To: File.

Subject: Meeting of November 12, 1948—Security Responsibilities for the Temporary Site.

On November 12, 1948, a meeting was held at the DuPage Site to discuss the security responsibilities and to clarify the relationship between the AEC, the University of Chicago, and Argonne National Laboratory in the security program for the temporary site. Present were A. Tammaro and J. R. Yore, AEC; C. K. Weidner and B. Evans, University of Chicago; W. H. Zinn and R. A. Hessler, Argonne National Laboratory.

The following agreements were reached:

1. ANL will continue to assume security responsibility for facilities released to them for occupancy.

2. University of Chicago and construction contractors will assume responsibility for security of facilities under construction and construction materials.

3. ANL will take over guarded entrance posts to the site from the University of Chicago construction contractor as soon as adequate guard personnel are available.

4. Identification of personnel entering the site:

(a) ANL employees assigned to DuPage Site will be identified by—

(1) ANL Bus.

(2) ANL Station Wagon.

(3) AEC Car or private vehicle with ANL registered windshield sticker. These stickers will be issued only for AEC or private vehicles being used by DuPage Site assigned employees.

<sup>1</sup> Passes illustrated on pp. 924-927.

(b) ANL employees not regularly assigned to DuPage Site and ANL visitors will be identified by badge or other authorized pass and will also be registered at site entrance posts between 6 p. m. and 6 a. m.

(c) Construction personnel. (Details to be worked out with Mr. B. Evans.)

5. All personnel entering or leaving site will be subject to spot checking and spot car inspection by post guards.

6. All written security orders or procedures mutually affecting operations of ANL, U of C, and its subcontractors and the AEC will be exchanged by said parties to prevent misunderstandings and to keep all affected parties informed.

7. The AEC Security Office will be kept informed of all security procedures and opinions will be requested from this office when pertinent to AEC Security regulations or interests,

R. A. HESSLER,  
Security Officer.

ARGONNE NATIONAL LABORATORY,  
Chicago 80, Ill., November 18, 1948.

Effective November 22, 1948, Argonne National Laboratory guards will take over the security posts at the entrance to Temporary Site "D".

The following instructions have been issued to the guards regarding access:

1. Post at Old Bailey Road south of Site has been designated as an ANL entrance. ANL station wagons, and busses, and AEC or private cars identified by an ANL windshield sticker will be admitted at any time without challenge. (Stickers will be issued by request through the Site Administrator's Office, to DuPage Site employees only.)

2. Post at Main gate will be maintained as an entrance for construction personnel. ANL employees may encounter traffic congestion here.

3. Post at Old Bailey Road north of Site will be maintained as a truck entrance for construction contractor.

Routine spot checks for personnel identification and car inspection will be made at all posts.

R. A. HESSLER,  
Security Officer.

**BULLETIN GM-76, ISSUED MARCH 10, 1948, GOVERNING ALLOCATION AND TRANSFER  
OF FISSIONABLE MATERIALS OUTSIDE OF ROUTINE PRODUCTION CHANNELS**

**ATOMIC ENERGY COMMISSION**

Bulletin  
GM-76

Research  
Fissionable Materials

**ALLOCATION AND TRANSFER OF FISSIONABLE MATERIALS OUTSIDE OF ROUTINE  
PRODUCTION CHANNELS**

Ref.: Atomic Energy Act of 1946.

For: All AEC Offices.

1. *Purpose.*—This Bulletin establishes procedures for the allocation and transfer of fissionable materials outside of routine production channels but within Commission Laboratories. It does not apply to the transfer of fissionable materials to and from Los Alamos when such transfer is made in accordance with established production rules. This Bulletin is effective immediately, superseding present procedures for securing authorization by Commission Laboratories for the transfer of fissionable materials outside of routine production channels. This does not alter procedures established by Bulletin GM-2 and Atomic Energy Commission Regulations, Operations No. 1 and No. 2.

2. *Definitions.*—(a) Fissionable material, as used in this Bulletin, means U-233, Pu-239, and uranium enriched in U-235.

(b) Commission Laboratory means any research laboratory owned by the Commission or in which research is conducted pursuant to contract with the Commission.

(c) Laboratory program means any research program which required the use of any fissionable material and which is conducted in a Commission Laboratory by the Commission or pursuant to contract with the Commission.

3. *Basic quota.*—The Managers of Directed Operations will see that—

(a) All Commission Laboratories having inventories of fissionable material, or who expect to submit requests for any quantity of fissionable material, will submit copies of their standard operating procedures for handling these materials to the appropriate Manager of Operations, together with a request for the establishment of a Basic Quota of fissionable material for that laboratory. These procedures should include the detailed safety, security, health, and accounting measures which have been or will be established by the laboratory. The Manager of Operations will forward the procedures, with recommendations, to the General Manager for approval. The Basic Quota for each fissionable material should be commensurate with the requirements of laboratory programs approved by the Commission. Such Basic Quota shall not include any quantity of fissionable material with respect to any laboratory program for which the General Manager considers a Special Quota pursuant to paragraph 4 below to be appropriate, but shall include all other quantities of fissionable materials on hand at the first of each year and required by the laboratory during the next calendar year.

(b) All fissionable material possessed or obtained by a Commission Laboratory within its Basic Quota may be utilized by the laboratory in connection with such programs as the Director of the laboratory may deem necessary or desirable.

(c) Whenever the quantity of any fissionable material in the possession of a Commission Laboratory is less than the Basic Quota authorized for that Laboratory, the Laboratory Director may submit to the Manager of Directed Operations of his area a request for the transfer of additional fissionable material within the limits of such Basic Quota. Such transfers may be arranged between the Managers of Directed Operations concerned, except that the transfer of all quantities in excess of 100 grams of U-235 or in excess of 10 grams of either U-233 or Pu-239 shall be subject to the approval of the General Manager.

(d) Requests by Commission Laboratories for increases in their Basic Quota shall be referred to the General Manager by the appropriate Manager of Directed Operations. The request shall include justification for the increase and a statement of any changes contemplated in procedures approved by the General Manager pursuant to subparagraph 3a of these instructions.

4. *Special quotas.*—(a) Whenever a Commission Laboratory desires the allocation and transfer of a quantity of fissionable material that cannot be received as a part of its Basic Quota, the laboratory may request a Special Quota of fissionable material. When small quantities in excess of the Basic Quota of the Laboratory are required for use in connection with several programs, the laboratory should normally request an increase in its Basic Quota.

(b) The Manager of Directed Operations should submit the requests of the laboratories for special quotas to the General Manager for approval. The request should be in the form of a feasibility report describing the proposed use of the material, step by step, and presenting specific details of safety, security, and health measures to be taken, including procedures for accounting for the material and plans for the recovery of the material. The feasibility report should, in general, be prepared by collaboration between the staff of the Manager of Directed Operations and the requesting agency. Where applicable, the Standard Operating Procedures called for in paragraph 3a above may be cited. The Manager of Directed Operations concerned will forward the feasibility report to the General Manager with his recommendations. The Director of Research will coordinate and integrate all requests for Special Quotas for the General Manager as follows:

(1) Appoint, where he deems it desirable, a feasibility committee composed of qualified scientists, and arrange for the committee and representatives of other interested offices to review and evaluate the feasibility report, visiting the site if required.

(2) Ascertain from the Director of Security and Intelligence that the proposed security measures will be adequate.

(3) Ascertain from the Director of the Production Division that the material is available and that the proposed accountability procedures will be adequate.

(4) Ascertain from the Director, Division of Biology and Medicine that the proposed health measures will be adequate.

(5) Notify the Director of Military Application Division of the proposed action.

(6) Determine that the material requested is in accordance with the amounts allocated for research in general.

(7) Recommend to the General Manager that authorization be issued to use the material as proposed and to initiate such transfers as are necessary.

(c) Special quotas of fissionable material will be used only in connection with the program for which they have been authorized and will in general be returned to production channels promptly when no longer required.

5. *Return of fissionable material.*—The return of fissionable material to production channels will be arranged between the Managers of Directed Operations concerned. The Manager receiving the material will determine that the material is in proper condition for acceptance and will authorize the transfer after the necessary reviews have been made to provide for the safe and secure transfer to production channels.

6. *Accountability and transfers.*—All arrangements between Managers of Directed Operations for the transfer and accountability of fissionable material will be accomplished in accordance with the requirements of Bulletin GM-2 and AEC Regulations, Operations No. 1 and No. 2, regarding shipments and accountability.

7. *General.*—The various Managers of Directed Operations should see that each Commission Laboratory submits, by December of each year, to the Manager of

Directed Operations concerned an estimate of the total amount of each fissionable material which will be required during the next calendar year involving both Basic and Special Quotas. These estimates should be forwarded to the General Manager for approval along with the recommendations of the Manager of Directed Operations. All Basic and Special Quotas of fissionable materials will be subject to cancellation or reduction by the General Manager. Commission Laboratories should be made responsible for the security and conservation of all fissionable material in their possession. Material for which there are no foreseeable uses should be returned promptly to production channels.

8. *Transfers involving Commission facilities not authorized a basic quota.*—No Commission Laboratory will at any time remove any quantity of fissionable material from its own premises except by express authority of the appropriate Manager of Directed Operations or of the General Manager. When such removal is for the purpose of obtaining special outside assistance (for example, preparation of special shapes of enriched uranium in a Commission facility not having a Basic Quota) the request for authority to transfer the material will be submitted by the removing laboratory to the appropriate Manager of Directed Operations in the form of a feasibility report, showing the need for such outside assistance and describing details of safety, security, health, and accounting measures to be observed by the removing laboratory and the assisting organization. This report should be prepared by collaboration between the contractors concerned. Approval for such transfers will be granted by the Manager of Directed Operations concerned after such study as he shall deem necessary.

9. *Security.*—The field security offices will, by thorough and frequent inspections, insure that the security measures established prior to the approval of a Basic or Special Quota of fissionable material are effectively and conscientiously carried out by the Commission Laboratory. In all AEC security areas, for the purpose of storage, handling, use, and transporting fissionable materials in accordance with these instructions, all quantities of plutonium and U-233 in excess of 10 grams and all quantities of U-235 in excess of 100 grams shall be given appropriate TOP SECRET security protection. All other quantities of U-233, U-235, and plutonium shall be afforded appropriate Secret security protection. Outside of AEC security areas, all quantities of U-233, U-235, and enriched uranium or plutonium in excess of one milligram shall be given TOP SECRET security protection.

CARROLL L. WILSON,  
General Manager

Issuance date: March 10, 1948.

Received, April 5, 1948, 10:12 a. m., United States Atomic Energy Commission, Mail and Records Branch, Chicago, Ill.

BULLETIN GM-95, ISSUED JULY 23, 1948, GOVERNING ACCOUNTING FOR SOURCE AND FISSIONABLE MATERIALS

#### ATOMIC ENERGY COMMISSION

Bulletin  
GM-95

Production  
SF Accountability

#### ACCOUNTING FOR SOURCE AND FISSIONABLE MATERIALS

Ref.: Section 5, Atomic Energy Act of 1946. This Bulletin supersedes AEC Regulations, Operations No. 1 and No. 2, and Instruction OR-2 (Supp. 6).  
For: Managers of Operations.

1. *Scope.*—(a) The provisions of this Bulletin shall apply to all source and fissionable materials in the possession of or in use by the Atomic Energy Commission, its contractors, or other Government agencies. This shall include source and fissionable materials involved in research activities as well as production or storage operations. However, there shall be excluded from the scope of this Bulletin the following:

- (1) Source material not owned by the Atomic Energy Commission.
- (2) Source material prior to removal from its place of deposit in nature.

2. *Purpose.*—(a) The value and strategic importance of source and fissionable materials require accurate accounting control over these materials, hereinafter referred to as SF materials.

(b) The purpose of this Bulletin is to establish—

(1) A measurement and record system for transfers and inventories which will protect both the Atomic Energy Commission and its contractors against undetected loss or diversion of SF materials, and, in addition, will promptly provide current and accurate information as to the disposition and availability of SF materials.

(2) A system of surveys to provide management with information as to the adequacy of SF material accounting procedures in effect.

(c) This Bulletin is arranged in 10 sections, as follows :

Section	Subject	Page <sup>1</sup>
1	Scope .....	1 (907)
2	Purpose .....	1 (908)
3	Program Development and Administration .....	2 (908)
4	Surveys .....	6 (909)
5	SF Accountability Stations .....	7 (910)
6	Accountability Representatives .....	8 (910)
7	Measurement Methods .....	8 (911)
8	Monthly Inventory and Material Balance Reports .....	10 (911)
9	Transfer Records .....	13 (913)
10	Interpretations and Procedural Instructions .....	18 (915)

<sup>1</sup> Numbers in parentheses refer to pages in this appendix.

(d) Since custody of SF materials entails responsibility for preventing diversion and for minimizing avoidable losses, each receiver shall independently measure SF materials received to determine the magnitude of the responsibility incurred, and each shipper shall measure SF materials shipped to determine the extent to which responsibility is relieved. (Measurement methods, exceptions, and practicability shall be governed by Section 7 of this Bulletin.)

(e) The comparison between independent measurements by shipper and receiver provides the Atomic Energy Commission an essential element of accounting control over delegated responsibilities for SF materials.

(f) Physical inventories shall be taken to verify the nature and quantities of SF materials. Material balance reports showing inventories, receipts, shipments, consumption, production, and losses of SF materials shall be submitted as soon as possible after the end of each month. (Inventory methods, exceptions, and practicability shall be governed by Section 7 of this Bulletin.)

3. *Program Development and Administration.*—(a) SF accountability stations: (1) SF Accountability Stations shall be established by each Manager of Operations to facilitate accounting for SF materials. For this purpose, the term "SF Accountability Station" shall mean one organization at one location having custody of and responsibility for SF materials independently of other organizations at the same or other locations. The Atomic Energy Commission and its several contractors are separate organizations. If both an AEC office and a contractor organization are located at the same place, and each handles or has custody of SF materials, the two organizations shall constitute separate Accountability Stations. (The term "SF Accountability Station" as used in this section refers to an entire plant. This does not preclude or concern the establishment of such internal material balance areas within a plant as may be deemed desirable by operating supervision.)

(2) Acceptance of SF materials by an Accountability Station entails the responsibility to properly account for the materials received.

(3) It shall be the responsibility of each Accountability Station to develop inventory and material balance procedures which will reflect as accurately as is reasonably possible the necessary information regarding all SF materials handled. This responsibility includes the development of adequate weighing, sampling, analytical and recording methods and the determination of the accuracy and precision of the measurements.

(4) It is recommended that each installation devise a single system of inventory and material balance records and reports which will provide information required for both accounting control and operating supervision rather than to employ two parallel systems.

(b) Managers of operations. (1) Responsibility for the administration of approved programs of SF material accounting control rests upon each Manager of Operations. He shall—

(a) Determine that all contractor and AEC organizations under his jurisdiction which handle or have custody of SF materials are acquainted with the material accounting objectives and requirements of the Atomic Energy Commission as outlined in this Bulletin.

(b) Insure that these organizations inventory, report, and transfer SF materials in accordance with the provisions of this Bulletin.

(c) Arrange for the establishment of SF Accountability Stations, with designated SF Accountability Representatives, prior to transfer of any SF material to AEC or contractor organizations.

(d) Maintain appropriate records of inventories, receipts, shipments, consumption, production and losses of SF materials at Accountability Stations under his jurisdiction, and submit monthly consolidated inventory and material balance reports covering SF materials at these Accountability Stations.

(e) Maintain a continuing study of quantities of SF material lost or unaccounted for at Accountability Stations under his jurisdiction.

(f) Institute procedures which will minimize the possibility of undetected loss or diversion of SF materials.

(g) Work with the Division of Production staff in the development of national programs, standards, and procedures based upon operating needs.

(h) Arrange surveys of each Accountability Station under his jurisdiction as frequently as conditions demand, but at intervals not greater than 3 months for each major Station and not greater than 6 months for each other Station.

(i) Arrange assistance and participation in surveys of Accountability Stations under his jurisdiction made by the Source and Fissionable Materials Accountability Branch, Division of Production.

(j) Insure that each AEC local office provides a continuing review of the adequacy of material accounting controls developed and maintained by Accountability Stations under its jurisdiction.

(2) Division of Raw Materials: For purposes of this Bulletin, the Division of Raw Materials shall be considered an Office of Directed Operations. Provisions concerning Managers of Operations and Offices of Directed Operations shall apply equally to the Director of Raw Materials and the Division of Raw Materials.

(c) Division of production: (1) A source and Fissionable Materials Accountability Branch has been established in the Division of Production. The Branch shall coordinate and give staff supervision to the development and administration of physical unit accounting control over source and fissionable materials of the Atomic Energy Commission. To determine the adequacy of the national system of source and fissionable physical unit material accounting control and to provide the Atomic Energy Commission with information as to the effectiveness and reliability of this control; the Branch shall also survey SF Accountability Stations handling or having custody of SF materials. Specifically the Source and Fissionable Materials Accountability Branch shall—

(a) Establish, within the policies prescribed by the General Manager, physical SF material accounting and reporting procedures necessary to provide over-all physical control for source and fissionable materials of the Atomic Energy Commission.

(b) Develop and recommend to the Director of Production improved physical accounting safeguards against diversion of materials.

(c) Prepare consolidated reports in units of inventories, transfers, and losses of source and fissionable materials.

(d) Determine the reliability of SF material physical accounting data reported by the various contractors and by AEC offices.

(e) Maintain a continual review of SF material physical accounting controls, including inventory procedures and measurement methods.

(f) Survey Accountability Stations to evaluate the status and effectiveness of material unit accounting control and as may be directed by the Director of Production.

(g) Consult with and advise the Offices of Directed Operations regarding SF material physical accounting problems.

4. *Surveys.*—(a) Definition: (1) For purposes of this Bulletin, a survey is a comprehensive examination, analysis and evaluation of all phases of SF material accounting control, including inventory procedures and measurement methods.

(2) The survey requirements established by this Bulletin are distinct and separate from the security inspection and survey requirements established by Bulletin GM-60.

(b) Objectives: SF material accounting surveys shall be made to determine and record the effectiveness of SF material records, inventory and measurement methods in use, and to provide management with information as to the adequacy of these procedures.

(c) Reports: Survey findings shall be summarized in short narrative reports, including—

(1) Description of the activity performed at the installations surveyed, sufficiently complete to permit proper evaluation of the report and recommendations.

(2) Quantities of SF materials handled, included shipment, receipts, and inventories.

(3) Quantities of SF material lost or unaccounted for, with explanations of processing losses and information as to the reliability of the inventory and material balance data reported.

(4) Adequacy of material accounting control, with explanation of desirable changes in records, inventory procedures, and measurement methods.

(5) Extent of action on previous survey report recommendations.

(6) Recommendations.

(d) Report distribution: The distribution of survey reports shall include one copy for the organization surveyed, one for the Manager of Operations having jurisdiction, and one copy for the Director of Production.

(e) Performance of surveys: (1) By Offices of Directed Operations: Personnel of each Office of Directed Operations shall make surveys of Accountability Stations under its jurisdiction as scheduled by the Manager of Directed Operations.

(2) By Source and Fissionable Materials Accountability Branch: Surveys shall also be made by the Source and Fissionable Materials Accountability Branch, Division of Production, as required by the Director of Production. Each Office of Directed Operations shall participate and assist in surveys of Accountability Stations under its jurisdiction when made by the Source and Fissionable Materials Accountability Branch.

(f) Scope and frequency: (1) Every SF Accountability Station shall be surveyed to determine the status and adequacy of material accounting control.

(2) Surveys of Accountability Stations under its jurisdiction shall be made by each Office of Directed Operations as frequently as conditions demand, but at intervals not greater than 3 months for each major Station and not greater than 6 months for each other Station.

(3) If an SF Accountability Station is surveyed by an Office of Directed Operations in conjunction with the Source and Fissionable Materials Accountability Branch, Division of Production, no separate survey by the Office of Directed Operations within the specified interval is required.

5. *SF accountability stations.*—(a) The SF Materials Accountability Branch shall assign a three-letter code symbol to each SF Accountability Station (AEC office or contractor's organization) which handles SF materials.

(b) Examples of codes for SF Accountability Stations are as follows:

CCC—Carbide and Carbon Chemicals Corp., K-25 Plant, Oak Ridge, Tenn.

CKA—USAEC, K-25 Operations Office, Oak Ridge, Tenn.

ANL—Argonne National Laboratory, Chicago, Ill.

CHA—USAEC, Chicago Directed Operations, Chicago, Ill.

CAB—USAEC, SF Materials Accountability Branch, Oak Ridge, Tenn.

CPA—USAEC, Oak Ridge Directed Operations, Oak Ridge, Tenn.

(c) It shall be the responsibility of Managers of Operations to notify the SF Materials Accountability Branch, Division of Production, Oak Ridge, Tenn., of any additional Accountability Stations necessitated by operations or research activities, so that appropriate code symbols can be assigned and revised Accountability Station Code sheets can be issued to keep the list current.

(d) Establishment of an Accountability Station does not imply authorization to ship source or fissionable materials from or to that station. Shipments from and receipts by Accountability Stations must first be authorized by the AEC offices having jurisdiction over those Stations.

6. *Accountability representatives.*—(a) Centralizing the responsibility of accounting for receipts and shipments of SF materials in a particular plant, laboratory, or AEC office is the most practicable method of preventing omissions, duplications, and confusion in accountability records.

(b) Each Accountability Station shall therefore designate an Accountability Representative, who shall be accountable for all source and fissionable materials located in that Accountability Station and who shall also be responsible for maintaining adequate records of receipts, shipments, and inventories of SF materials. Shipments to an Accountability Station shall be consigned to its Accountability Representative; shipments from an Accountability Station shall show its Accountability Representative as consignor.

(c) This does not mean that materials should be physically delivered to or handled by the Accountability Representative or his subordinates. It means only that (regardless of where or by whom SF materials chargeable to an Accountability Station are received or shipped) the pertinent receiving or shipping documents shall, in all instances, finally go to the Accountability Representative and become part of his records.

7. *Measurement methods.*—(a) Using the most reliable practicable methods, the shipper and the receiver of SF materials shall independently determine the quantities transferred. Quantities of SF materials on hand at the end of each month shall be physically inventoried as accurately as practicable.

(b) General: In general, the measurement method shall be—

(1) Weight (or measure) and sample each unit, batch, or container of material.

(2) By analysis of the sample, determine the weight percent SF content and calculate the weight of SF material in the unit, batch, or container.

(3) If the SF material is uranium, determine the weight percent U-235 in the sample and calculate the weight U-235 in the unit, batch, or container.

(4) If sampling is impracticable, such as for finished metal pieces, alpha counting, and fission counting may be useful for determining SF and U-235 content. These methods must be cautiously employed for absolute determinations because they are affected by surface smoothness, presence of other materials and so on.

(c) Exceptions: (1) Uranium which has undergone no processing altering the natural U-235 content shall be deemed to be 0.705 weight percent U-235 and no isotopic determination is required.

(2) Units, batches, or containers of material which have maintained unchanged identity, SF content, and relative isotopic composition since the last inventory need not be reweighed and resampled for the monthly inventory, but the inventory system should provide for a physical verification of the presence of such items and assurance that no change in content has occurred.

(d) Practicability: (1) Practicability of accurate measurement is affected by such diverse factors as type of material, its quantity, its strategic and financial value, the difficulties of measurement, the cost of measurement, the extent of analytical data on like material, the availability of personnel and facilities, the contribution of the measurement inaccuracy to the uncertainty of the over-all plant or laboratory material balance, etc. Such factors may render impracticable all or part of the sampling, weighing, and analytical routines outlined above as general measurement methods. Statistical analysis of these routines will aid correct judgment as to practicability and will help in finding practicable improvements to routine measurement procedures.

(2) Material transferred or inventoried may include relatively large amounts of some material as well as small samples assigned to research work on a semi-permanent basis. Under such circumstances it could be practicable to conduct a monthly physical inventory of materials present in quantity, including weighing, sampling, and analysis but not practicable to measure accurately the small research samples more often than quarterly, semiannually, or annually. For extremely small quantities it is, of course, impossible to sample and analyze the material without consuming the entire amount, and under such circumstances only a limited verification can be made.

(e) Reliability: Reliability of determination of net weight of SF material is influenced by adequacy of sampling procedures and by accuracy and precision of weighings and of chemical and physical analyses that together comprise the determination. Modern statistical methods will be useful in evaluating sampling plans, determining accuracy and precision, and recognizing possible improvements in sampling and measurement schemes. Statistical analysis of the over-all material balance will indicate the relative importance of the several sources of unreliability, enabling efficient allocation of effort to improve reliability.

8. *Monthly inventory and material balance reports.*—(a) Each SF Accountability Station which has SF materials on hand or which receives or ships SF materials as consignee or consignor shall report such materials monthly in accordance with this Bulletin.

(b) General arrangement: (1) Inventory and material balance reports shall be generally arranged in the form illustrated by Exhibit I. Different SF materials, e. g., uranium and thorium, shall be shown in separate columns or on separate sheets.

(2) Inventory and material balance reports shall contain two sections, one showing a material balance for the current month and one showing a year-to-date balance.

(3) Weights shall be reported in metric units. Weighing should be done in these units where practicable. If pound scales are used, weight totals should be converted for inventory and material balance report purposes on the basis of 0.45359 kilogram per pound. (The use of this conversion factor does not require any change in weighing, e. g., materials which are now weighed to the nearest pound may still be so weighed, but report totals shall be in metric units.)

(4) Inventory and material balance report terminology and material classifications shall conform to the explanatory notes appended to Exhibit I.

(c) Material type segregation: Material received or shipped and material inventoried as Feed Storage, Material in Process, etc., shall be subdivided to show separately major material types. For example, significant amounts of uranium metal and of uranium oxide shall be shown separately rather than as a combined item. Minor material types not involving significant quantities may be lumped together as miscellaneous.

(d) Isotopic content segregation: Uranium inventoried as Feed Storage, Material in Process, etc., shall be further subdivided to show separately materials significantly different in isotopic composition. Uranium receipts, removals, or unaccounted for amounts which are significantly different in isotopic makeup shall also be shown separately. For uranium reporting purposes "significant" ranges of depleted (less than 0.705 weight percent U-235) material shall be +0.025 weight percent. "Significant" ranges for enriched (more than 0.705 weight percent U-235) material shall be +2.5 weight percent; for example, uranium 6 percent U-235 and uranium 9 percent U-235 need not be separately shown on inventory and material balance reports, but uranium 6 percent U-235 should be segregated on the report from uranium 12 percent U-235 because the difference in range is more than 5 percent. In all instances, depleted uranium, natural uranium, and enriched uranium shall be shown in separate columns, or upon separate sheets.

(e) Receipts and shipments: Receipts and shipments shall also be subdivided to show separately different consignors or consignees. However, it is not necessary to list separately different shipments to or receipts from any one Accountability Station unless the material types or isotopic contents differ significantly.

(f) Adjustments: The nature and amount of each adjustment shall be clearly described by an explanatory note. Beginning inventories reported for the month and for the year should agree with corresponding quantities previously reported. If adjustments have been applied to either of these inventories, both the previously reported quantity and the adjusted quantity shall be shown.

(g) Inventory dates: An inventory of SF material should be taken on the last day of each calendar month. In the event that a physical inventory on the last day of the month is not feasible, an inventory taken within the week preceding or the week following the end of the month and adjusted for intervening receipts and shipments shall be used as a basis for the required month-end inventory.

(h) Inventory basis: The inventory and material balance report shall explain the measurement methods used to determine the various portions of the ending inventory. (Measurement methods are discussed in Section 7 of this Bulletin.) Portions of the inventory not measured shall be described, with an explanation of how these quantities were determined and why measurements were not practicable.

(i) Reliability of data: The inventory and material balance report shall indicate the reliability of the various items by showing the probable limits of error.

(j) Report transmittal: Inventory and material balance reports shall be signed by the person responsible for preparation and issuance of the report, and shall be classified in accordance with existing security regulations. The report shall be sent to the Manager of Operations having jurisdiction over the Accountability Station, with an information copy to the Source and Fissionable Materials Accountability Branch, Division of Production, Oak Ridge, Tenn. This information copy may be transmitted directly or through the Office of Directed Operations, at the discretion of the Manager of Operations concerned. Inventory reports through the end of each month shall be submitted as soon as possible after the inventory date.

(k) Consolidated reports: Each Office of Directed Operations shall prepare monthly a consolidated inventory and material balance report covering all SF materials located within its jurisdiction. One copy of the consolidated report shall be submitted as soon as possible after the inventory date to the Source and Fissionable Materials Accountability Branch, Division of Production, Oak Ridge, Tenn.

(2) The consolidated report shall show the total beginning inventory, total receipts from the jurisdiction of each other Office of Directed Operations, total shipments to the jurisdiction of each other Office of Directed Operations, total measured losses, the total ending inventory, and the total material lost or unaccounted for. The quantity of SF material at each Accountability Station and the shipments in transit shall be listed to indicate the location of the total ending inventory.

(3) The nature and amount of any adjustments shall be clearly described by an explanatory note. An explanation of material reported lost or unaccounted for shall be included in the report.

9. *Transfer records.*—(a) Exhibit II is a copy of the SF Shipping Form, AEC Form 101. This form shall be used to record all transfers of SF materials. Physical transfer of SF materials shall entail transfer of accountability to the SF Accountability Station receiving the materials. No transfer of accountability for SF material shall be effective without a physical transfer of that material or transfer of the physical custody of that material. The use of any other form to transfer accountability for SF materials is prohibited.

(b) Shipping form content: Transfer data shall be recorded on SF Shipping Forms as provided below:

(1) Transfer series: The code symbol of the shipping and receiving Accountability Stations shall be shown in the transfer series blanks; for example, material transferred from Carbide and Carbon Chemicals Corporation, K-25 Plant, Oak Ridge, Tenn., to Argonne National Laboratory, Chicago, Ill., would have the transfer series blanks filled in as from CCC to ANL.

(2) Shipping form number: Shipping Forms of each transfer series shall be consecutively numbered, so that any misplaced shipping form will be indicated by a break in the series of numbers.

(3) To (receiver): (a) As stated above, the name of the Accountability Representative of the receiving Accountability Station shall be shown as the receiver of the materials. The plant, laboratory, or AEC office which he represents will be shown in the organization blank.

(b) The "Deliver to" and address shown should be that to which the material is to be delivered, which frequently will not be the office address of the Accountability Representative. It is suggested that the name of the person (or section) to physically receive the material be shown in these blanks, e. g.—

To: (Receiver).

Organization: Amalgamated Laboratories, Inc.

Attention: Mr. John Brown.

Deliver to: Dr. Richard Roe, Building 4F.

Address: 1947 Main Street, St. Louis, Mo.

(c) In this example Mr. Brown is Accountability Representative and Dr. Roe is the person who will receive the materials.

(4) From (shipper): The name of the Accountability Representative of the shipping Accountability Station shall be shown in this space.

(5) Distribution of copies: (a) Copy distribution shall be indicated by use of SF Accountability Station code symbols. If a copy goes to one office for subsequent transmittal to another office, both the intermediate and ultimate receiver shall be shown in the "Distribution of Copies" space. For example, the copy distribution space on an SF Shipping Form covering a transfer of material from Carbide and Carbon Chemicals Corporation, K-25 plant, to Argonne National Laboratory would be marked as follows:

Number	Distribution of copies
1.-----	ANL to CCC
2.-----	ANL
3.-----	CCC
4.-----	ANL to CAB
5.-----	CKA to CPA to CAB
6.-----	ANL to CHA
7.-----	ANL to CKA to CPA

(b) Provisions on the back of the SF Shipping Form which cover copy distribution specify that in certain instances copies 6 or 7 or both shall be omitted. Omitted copies shall be indicated in the "Distribution of Copies" space by the words "None Prepared." For example, the copy distribution space on an SF Shipping Form covering a transfer of material from the Carbide and Carbon Chemicals Corporation, K-25 Plant, to the Office of Chicago Directed Operations would be marked as follows:

<i>Number</i>	<i>Distribution of Copies</i>
1-----	CHA to CCC
2-----	CHA
3-----	CCC
4-----	CHA to CAB
5-----	CKA to CAB
6-----	None prepared
7-----	CHA to CKA to CPA

(c) There would be no copy 6 because the receiver is an AEC Office of Directed Operations. The other copies would be numbered 1 of 7, 2 of 7, 3 of 7, 4 of 7, 5 of 7 and 7 of 7; the notation "None prepared" is necessary to explain the absence of copy 6 of 7.

(6) Container Number: (a) In any shipment consisting of items separately measured by the shipper, the several containers must be clearly marked with number or symbol in order that the receiver may identify the respective items for purposes of check measurements.

(b) Either SF Shipping Forms or a packing slip identifying the materials shall be sent with each shipment.

(7) Shipper's data: (a) Material transferred shall be completely described in the space provided. The description shall include the physical state (e. g., metal, alloy, compound, solution) and the name of the source or fissionable material contained (e. g., uranium, thorium). For pure compounds the empirical formula shall also be given.

(b) In all instances, the shipper shall show the net weight of the material, and, wherever feasible, the gross and tare weights.

(c) Unless the material is 100% source or fissionable metal, the shipper shall also show in the appropriate column the net weight of each SF material.

(d) If the SF material is uranium depleted or enriched in the U-235 isotope, the weight U-235 shall be shown in the blank column to the right of the "SF Net" column. Uranium which has undergone no processing altering the natural U-235 content shall be deemed to be 0.705 weight percent U-235. For such uranium write "normal" instead of the weight U-235 in this blank column.

(e) Column totals for all weight columns (gross, tare, net, SF and U-235) shall be shown immediately following the listing of individual batches or containers.

(f) Shipper's comments on measurement methods used shall be shown in the "Measurement Methods" space. For examples, if the shipper weighed the material but determined net SF content by estimate rather than by analysis, this information shall be shown. If the shipper is relaying material received from another station without making any measurements, a note explaining the source of the measurements shall be shown. If more space is needed, supplemental sheets may be attached to the SF Shipping Form.

(g) Additional information copies of SF Shipping Forms may be authorized by the Managers of Operations concerned.

(8) Receiver's data: (a) Since the comparison between independent measurements by shipper and receiver provides the Atomic Energy Commission with an essential element of accounting control, it is required that the receiver independently measure material if practicable.

(b) The receiver's measurements with comments on the measurement methods shall be recorded in the "Receiver's Data" space in a manner corresponding to that outlined above for "Shipper's Data."

(c) If shipper's weights are shown on a basis different from the receiver's scales, e. g., if shipper's weights are in pounds and receiver weighs on metric scales, the receiver's weights shall be converted at 0.45359 kilogram per pound to the same units as the shipper's weights to facilitate comparison.

(d) If the receiver accepts the shipper's measurements without verification, the weight columns shall be left blank and the comment "Shipper's Measurements Accepted Without Verification" recorded in the "Measurement Methods" space. By accepting the shipper's measurements the receiver also accepts responsibility and accountability for the quantities shown by shipper.

(e) If receiver's measurements will materially delay distribution of SF Shipping Forms, the "Receiver's Data" section should be marked "To be furnished later" and copies of the SF Shipping Form distributed as soon as possible. The "Receiver's Data" shall be furnished as soon after receipt as practicable, using SF Supplemental Measurement Report AEC Form 102 (a copy of which is attached as Exhibit III) distributed to the Accountability Stations concerned. SF Supplemental Measurement Reports shall be distributed not later than the issuance date of the monthly inventory and material balance report covering the month in which the shipment was received.

(c) Classification and transmittal: (1) SF Shipping Forms and Supplemental Measurement Reports shall be classified in accordance with existing security regulations.

(2) The distribution of SF Shipping Form copies is indicated on the back of the form. Each Accountability Station shall maintain a record of the distribution of Shipping Forms (whether classified or unclassified).

(3) SF Shipping Forms shall be issued not later than the date of shipment.

(4) Whenever SF material is escorted from shipper to receiver, the escort should carry the appropriate copies of the Shipping Form recording the transfer.

(5) It is essential that copies of shipping documents be received and transmitted as promptly as possible.

(6) Shipment and receipt totals shown on monthly inventory and material balance reports shall agree with the transfer data shown on SF Shipping Forms and Supplemental Measurement Reports. If changes or adjustments in shipper's data are found to be necessary after SF Shipping Forms have been issued, revised copies (labeled "Correction") shall be distributed. Any changes or adjustments necessary in receiver's data shall be distributed to the Accountability Stations concerned on SF Supplemental Measurement Report, labeled "Measurement Revision."

(7) Prior to submission of monthly inventory and material balance reports, Accountability Stations shall ascertain that the amounts of SF material reported as received from or shipped to each station agree with material transfer data on SF Shipping Forms or Supplemental Measurement Reports.

(d) Notice of shipments: Advance notice of shipments shall be furnished to the Accountability Representative of the receiver.

(e) Measurement discrepancies: (1) Measurements by the receiver should agree, within reasonable limits, with measurements by the shipper.

(2) Establishment of allowable discrepancy limits, within which receiver's measurements must agree with shipper's measurements, is the responsibility of AEC Offices of Directed Operations. Consideration should be given to the adequacy of sampling procedures and to the accuracy and precision of the component weighings and chemical and physical analyses. Any discrepancy exceeding its established limit shall be investigated as prescribed by the AEC Offices of Directed Operations concerned.

(3) The shipper and receiver may maintain their respective accountability records on the basis of their own measurements, but will attempt to reconcile differences in measurements. If unable to do so, shipper and receiver shall each make a full report to the AEC offices concerned.

**10. Interpretations and Procedural Instructions.**—The Director of Production is authorized and directed to issue interpretations and procedural instructions under this directive.

CARROLL L. WILSON,  
*General Manager.*

Shipped to _____	****	XXX
Shipped to _____	****	XXX
Measured losses <sup>7</sup> .....	****	XXX
Total removals .....		XXX
Ending inventory, _____, 19— <sup>8</sup>		XXX
Ending inventory plus removals .....		XXX
Material unaccounted for <sup>9</sup> .....		XXX
YEAR-TO-DATE MATERIAL BALANCE		
Beginning inventory, Jan. 1, 19—		XXX
Material received: <sup>5</sup>		
From _____	****	XXX
From _____	****	XXX
From _____	****	XXX
Total receipts .....		XXX
Beginning inventory plus receipts .....		XXX
Material removed: <sup>6</sup>		
Shipped to _____	****	XXX
Shipped to _____	****	XXX
Measured losses <sup>7</sup> .....	****	XXX
Total removals .....		XXX
Ending inventory, _____, 19— <sup>8</sup>		XXX
Ending inventory plus removals .....		XX
Material unaccounted for <sup>9</sup> .....		XXX

<sup>1</sup> Name of the month reported.

<sup>2</sup> Show separately major material types, as explained in Sec. 8c, with chemical formulae for compounds. Smaller quantities may be labeled miscellaneous.

<sup>3</sup> Report in metric units, and specify units (kilograms, grams, or milligrams) used. For uranium depleted or enriched in the U-235 isotope, show in separate columns (a) weight uranium, (b) weight percent U-235, and (c) weight U-235, and show separately amounts which are of significantly different isotopic make-up, as explained in Sec. 8d. For all other SF materials only the net weight of contained SF material is required.

<sup>4</sup> First day of the month reported.

<sup>5</sup> Name consignors and show receipts from different consignors separately. SF material obtained or produced by transmutation (conversion of one element to another) of other SF material should be shown under receipts and labeled "Produced from \_\_\_\_\_."

<sup>6</sup> Name consignees and show shipments to different consignees separately. SF material consumed by conversion to energy or by transmutation to another element should be shown under removals and explained.

<sup>7</sup> This designation shall be applied only to losses (such as SF material contained in flue gases, sewerage solutions, and other normal processing losses), the amount of which has been determined either by continuing complete measurement or by occasional measurement of representative batches or flows. To be classified as a measured loss a recurrent minor loss need not be continually measured, but it shall be redetermined at intervals appropriate to its magnitude and whenever changes in the process are likely to cause it to change substantially. The designation shall also be used for such items as spills or leakage of measured quantities of SF material.

Measured losses shall be itemized and fully described in a footnote.

The designation "measured losses" shall not be used for quantities determined merely by difference between input and output. Such differences shall be reflected as material unaccounted for, note 9.

<sup>8</sup> Last day of the month reported.

<sup>9</sup> This is the amount by which the sum of the beginning inventory plus receipts exceeds the sum of the ending inventory plus removals. It is therefore a balancing figure which includes losses, equipment contamination which cannot be measured and inventoried, and any unexplained differences.

If the sum of ending inventory plus removals is greater than the sum of beginning inventory plus receipts—which may occur, for example, if quantities of material previously unaccounted for are found or recovered during the current period—the balancing figure shall be shown in parentheses.

Insofar as practicable, amounts reported as Material Unaccounted For shall be explained by footnote.

*Exhibit I—Continued*

Material balance <sup>1</sup>	Material type <sup>2</sup>	SF Material weight <sup>3</sup>
COMPOSITION OF ENDING INVENTORY		
Feed storage <sup>10</sup> .....	****	XXX
Material in process <sup>11</sup> .....	****	XXX
Material in research and development <sup>12</sup> .....	****	XXX
Inactive material <sup>13</sup> .....	****	XXX
Product <sup>14</sup> .....	****	XXX
Other <sup>15</sup> .....	****	XXX
Total ending inventory.....	-----	XXX

<sup>1</sup> Name of the month reported.

<sup>2</sup> Show separately major material types, as explained in Sec. 8c, with chemical formulae for compounds. Smaller quantities may be labeled miscellaneous.

<sup>3</sup> Report in metric units, and specify units (kilograms, grams, or milligrams) used. For uranium 'depleted or enriched in the U-235 isotope, show in separate columns (a) weight uranium, (b) weight percent U-235, and (c) weight U-235, and show separately amounts which are of significantly different isotopic make-up, as explained in Sec. 8d. For all other SF materials only the net weight of contained SF material is required.

<sup>10</sup> Feed storage shall include any material immediately available for processing, but on which processing has not begun. This will include unused material at a research laboratory.

<sup>11</sup> Material in process shall include all material in a production process (including routine analytical and assay samples incident to production control and accounting control over material in process) except material otherwise designated by explanatory notes (10), (12), (13), and (14).

<sup>12</sup> This includes that portion of material in production facilities which has been assigned to research and development or process improvement work as distinguished from production processing.

<sup>13</sup> Inactive material shall include production process material not immediately available for processing or not immediately intended for further processing. It will include all waste, scrap or depleted material. It will also include material in miscellaneous forms or compounds which may ultimately be recovered but which is not currently being processed.

<sup>14</sup> Material shall not be designated product until all processing has been completed. This designation shall be used for the product of the particular plant or process reported—what is "product" material at one plant or process may become "feed" material when transferred to another plant or another process. "Inactive" material at one plant or process may likewise become "feed" material when transferred to another plant or process. These designations as applied to particular types of material will therefore depend upon the location at which the materials are inventoried.

<sup>15</sup> Under this designation include only unusual categories of material for which none of the above designations are suitable.

EXHIBIT III

## THE ALLOCATION AND TRANSFER OF FISSIONABLE MATERIALS, DECEMBER 7, 1948

Report on the accounting, safety, security, and health measures within the Argonne National Laboratory:

ARGONNE NATIONAL LABORATORY,  
Chicago, Ill., December 7, 1948.

UNITED STATES ATOMIC ENERGY COMMISSION,  
Chicago Directed Operations, Chicago, Ill.

(Attention: Dr. S. M. Skinner.)

DEAR SIR: As required in Bulletin GM-76 there is attached a report on the accounting, safety, security, and health measures we currently practice in handling fissionable materials within the Argonne National Laboratory.

Yours truly,

T. S. CHAPMAN,  
Assistant Director.

LKH: mb

E. Rylander w/enc.  
File

## THE ALLOCATION AND TRANSFER OF FISSIONABLE MATERIALS

*I. Initiation of Request*

A. *Routing of the request form.*—1. The scientist with a requirement for fissionable materials submits to his division director five copies of the Special Materials Request form indicating, if possible, a source of supply.

2. Upon approval by the division director or his assistant, four copies of the request are sent to the Special Materials Department where it is checked as to availability of the material within the Laboratory. If the material is not available, a number is assigned to the request and three copies are sent to the Assistant Laboratory Director. After approval he forwards them to the AEC Office of Chicago Directed Operations. Upon approval by the latter, one copy is returned to the Special Materials Department, attached to the suspense copy, and placed in an open order file.

*II. Receipt of material*

A. *OCDO to Special Materials Department.*—1. Fissionable material is received by the Special Materials Department through the AEC Traffic Branch after the latter has executed a receiving report in quadruplicate indicating the Laboratory's request number for the materials. The receiving report is signed, one copy retained by the Special Materials Department and three copies returned to the Traffic Office.

2. After the material has been received, the Laboratory's request is removed from the open order file, delivery data entered, and placed in a closed order file. The receipt is noted in the receiving record book and a number is assigned to the Laboratory's receiving report which is made in quadruplicate. When the material is delivered to the requesting scientist, two copies of the receiving report are sent to his division's Special Materials Representative. One signed copy is returned to the Special Materials Department and filed under "Current Materials Received," the remaining copies of the receiving report are signed in the Special Materials Department and forwarded to the OCDO.

3. AEC form 101 is received from the shipper either by courier accompanying the shipment or by mail. The shippers' measurements are verified, if practicable, and so indicated. Upon arrival of the completed form by the Assistant Laboratory Director one copy is filed, the other distributed to the Accountability Stations listed on the form.

B. *Health.*—1. Before delivery to the recipient, the material is monitored by a member of the Health Physics Division. Radiation measurements are made on the periphery of the container and, when feasible, the material within the container is checked. A portable proportional counter is used to measure alpha activity; beta-gamma radiation is measured with a portable Geiger-Mueller Counter and the Zeus Survey Meter. A maximum level of 50 mr/hr is permitted at the surface of the container.

*C. Safety.*—1. Material improperly packed or shielded is not accepted. An electric crane facilitates the handling of heavy containers. The Laboratory maintains a Safety Department whose function it is to enforce proper safety methods.

*D. Security.*—1. In all movement of fissionable material outside guarded areas, an armed guard accompanies the material. All Laboratory reports are classified in accordance with directives issued under the SF Accountability Program.

### III. Storage

*A. Central Vault.*—1. Quantities of Pu-239, U-235, and U-233 not in immediate use are centrally stored at the Palos Park Site in combination safes within a fire-proof vault. Combinations are issued in sealed envelopes to the Laboratory Director and to those charged with the issuance of the material.

*B. Laboratory.*—1. In some instances where fissionable material must be stored at other installations for imminent use or processing, the material is confined within secondary containers and placed in a combination safe or kept under the permanent surveillance of an armed guard.

*C. Security.*—1. In all instances products are stored in guarded areas. Where combination locks are used, the combination within a sealed envelope is possessed by the Division Director and is known only to those he has assigned to issue material. Combinations are changed at six-month intervals unless an employee termination or transfer requires immediate action. All quantities of Pu-239 and U-233 in excess of 10 grams and all quantities of U-235 in excess of 100 grams is given Top Secret security protection. Smaller quantities of these materials are given Secret security protection.

*D. Health.*—1. Periodic air samples which are taken in storage locations are checked for alpha radiation. All glass containers are placed in more durable secondary containers. Rubber gloves, masks, coveralls, and shoe covers are utilized in handling quantities of Pu-239 solution.

*E. Accounting.*—1. Each item in storage is labeled, a card index is maintained in the office of each division's Special Materials Representative indicating material, amount, location, and other pertinent data. Vouchers are made for each receipt, shipment, transfer, discard, or loss and indicated on the respective cards.

### IV. Use

*A. Health Protection.*—1. Primary consideration is given for the health protection and safety of the workers during any operations with Pu-239 or other alpha-emitting substance. Constant monitoring of areas where such operation is involved is made by a member of the Health Physics Division by measurement of alpha activity from air samples.

2. No work involving these materials may be performed after working hours or on holidays without express permission of the Group Leader when the radioactivity exceeds the following limits:

(a) 100 mg of Pu-239.

(b)  $1.4 \times 10^{10}$  dis/min of any alpha activity.

3. The area where work involving any alpha-emitter is being done after working hours is known as a "red" area, such areas are indicated on a centrally located map when the guard is informed by the scientist that such work is to be done. A Health Physics representative is on duty at all times (24 hr. daily) in case of any emergency.

4. When fissionable material is being used in experiments and must be left after working hours (e. g., in apparatus from which it cannot be removed), an armed guard is informed and a danger sign stating the levels of activity and the hazard involved is posted at the area.

*B. Security.*—1. All work is done within AEC security areas and security protection is in conformance as to the type and quantity of material used as discussed in Part III.

*C. Accounting.*—1. Fissionable materials are received, stored, and released through the Special Materials Department. Vouchers are prepared for each transaction.

2. Since, from a scientist viewpoint, it is very necessary to know the amount, concentration, or activity of the material in use, many determinations are made in the course of a typical experiment. At the completion of the experiment, the product is recovered, purified, and returned to the Special Materials Department. If a loss has been sustained, it is reported at this time; weights are verified by

this Department and, if possible, the isotopic content is checked at the time of the physical inventory.

3. Elaborate precautions are taken to recover material injected into animals for metabolic studies. In instances involving only tracer amounts, however, recovery is impractical and a loss is recorded on the material upon injection into the animal.

#### **V. Internal Transfers**

*A. Health Protection and Safety.*—1. All fissionable material transferred within the Laboratory is monitored by a member of the Health Physics Division before leaving a guarded area. It may be transferred only through the Special Materials Department, whose men have been specially instructed as to the handling of the material. Only certain assigned vehicles are used in transfer, and all containers are securely strapped to avoid any possibility of a spill. The truck beds are monitored by a member of the Health Physics Division periodically.

*B. Security.*—1. No material may leave an area without a signed Special Materials Pass which is issued in duplicate by the authorized Special Materials Representative. One copy of this pass is collected by the exit guard. An armed guard is assigned to accompany the material until its delivery to the consignee site Special Materials Representative. Upon arrival at its destination the guard accompanying the material signs the reverse side of the duplicate pass, enters the time elapsed on the trip and presents it to the site guard. The passes are then sent to the Security Office where they are checked to see that all material leaving an area has arrived at its destination. The passes are then returned to the Special Materials Department where they are kept on file.

*C. Accounting.*—1. An Internal Transfer Form, signed by the Division Director, or by an individual authorized by him, must accompany each transfer of materials. The Internal Transfer Form is prepared in triplicate. All three copies accompany the material to its destination, where the Special Materials Representative of the recipient signs the three copies, retains one, returns one to the sender, and one to the Special Materials Department.

#### **VI. Treatment of Waste Material**

*A. Dry Waste.*—1. Dry waste containing fissionable material is discarded only after thoroughly considering the feasibility of recovery. Removal is requested on the Waste Removal Form which requires the signature of the division director. Each laboratory is supplied with a specifically marked, paper-lined, metal container which is used to receive dry radioactive waste. The cans are monitored daily and a request for removal is made when the cans are full or show a high level of activity. Trained men of the Safety Department equipped with coveralls, canvas and rubber gloves, safety shoes, and masks when necessary, carry out the task. The cans containing the waste are carefully loaded on the special truck and taken to the Palos Park Site where a specially fenced area (about 150 feet square) has been set aside for burial of this material. The material and paper lining are placed in pits which are about four feet square and six feet deep. The same pit is used until filled within eighteen inches from the surface. It is then covered with earth. If a container, used to transport active waste, shows any contamination of 10/mr/hr or more, when monitored by a member of the Health Physics Division, it is decontaminated before it is returned to the laboratory for use.

*B. Waste Solutions.*—1. The current practice is to transfer all waste solutions containing fissionable material to Oak Ridge National Laboratory for storage. Small, shielded stainless steel containers are being placed in each laboratory where waste solutions accumulate. At regular intervals these containers are collected and shipped via Government truck to Oak Ridge. The responsibility of keeping the record of material in a container rests with the scientists to whom it is charged. All shipments of solution are monitored by a member of the Health Physics Division prior to shipment, and a statement accompanies the material specifying the nature and activity level of the material. Before being returned, all containers are checked for external contamination.

#### **VII. Manufacture**

*A. General Practices.*—1. In the manufacturing of fissionable material, the same practices are followed as set forth under the subheading entitled "Use" (Section IV). The material is analyzed and the amount manufactured is recorded on a voucher and submitted to the Special Materials Department.

### VIII. Shipment

**A. Initiation and Processing of Shipments.**—1. A request for shipment of material, using the Special Materials Shipping Request Form, is originated in the office of the division director. The request shows the following information: the person requesting shipment, material to be shipped, amount, enrichment, measurement methods used, addressee, reference numbers, and special handling instructions. Of the five copies originated, one is retained on file in the division, the other four copies and the material are called for by a member of the Special Materials Department. In this office a record of the request is made and entered in a shipping record book, a shipping number assigned, and the material is prepared for shipment. One copy of the request is held in a suspense file and the three remaining copies, after approval by the Assistant Laboratory Director, are sent to the OCDO. The containers and materials are monitored by a member of the Health Physics Division and a statement certifying the activity level is signed by him. One copy of this statement is filed with the Special Materials Department and the other delivered to the Area Traffic Office with the material. The maximum activity level allowed at the surface of the container is 50 mr/hr. After shipment is made, the OCDO returns a copy of the shipping request to the Special Materials Department furnishing additional information such as actual date of shipment. This copy, with the suspense copy, is filed under "Current Material Shipped."

2. AEC Form 101 is executed by the Laboratory SF Accountability Representative and forwarded to the various accountability stations as set forth in the Bulletin GM-95.

**B. Security.**—1. Advance information regarding shipping is furnished the AEC so that couriers may be assigned to guard fissionable materials in transit from one accountability office to another. All papers are classified in accordance with directives issued under the SF Accountability Program.

**C. Safety and Health Protection.**—1. Fissionable materials are securely packed and sealed within boxed metal containers. A signed statement indicating the activity level is obtained from a member of the Health Physics Division prior to the shipment. All vehicles used in the transfer of material are monitored periodically.

### IX. Accounting and Inventory Methods

**A. The Physical Inventory.**—1. Physical inventories are completed for each division by its Special Materials Representative and submitted to the Special Materials Office by the last day of June and December of each year. A physical inventory consists of a personal survey by the Division Representative in which all material is verified by as many of the following means as its physical state and use will allow: It is seen, it is weighed, its dimensions are confirmed, samples in excess of one gram are checked chemically to verify the isotopic content, smaller samples may be checked as to their disintegrations per second.

**B. The Monthly Inventory.**—1. A monthly inventory, based and guided by the physical inventory, is also prepared by the Division Representative who keeps a card index indicating all transactions. Materials lost or discarded by the user are reported and a statement covering the reason for each loss or discard is given. This loss is ultimately reviewed by the Assistant Laboratory Director to determine whether or not it is reasonable.

2. The monthly inventory is submitted to the Special Materials Department where a Kardex file indicating the amount, material, location, concentration, and transfers of material is maintained. Fissionable material is reported to the nearest .01 mg with over-all quantities accurate to at least  $\pm 1\%$ .

**C. The SF Accountability Report.**—1. When the monthly report, which is classified secret, is received by the Special Materials Department, it is checked against the information on file. After all the inventories have been balanced the monthly SF Accountability Report consisting of the following five sections is prepared:

Section A consists of the year to date material balance. Shows the inventory at the beginning of the year, the total receipts, recovery, shipments, losses or discards, adjustments to the inventory since the beginning of the year, and the inventory to date.

Section B consists of the material balance for the month covered by the report. Shows the inventory as of the first of the month, receipts listed by number, material recovered, losses and discards, and the adjustment to the inventory (unaccounted for material).

Section C consists of a break-down of the losses listed in Section B. They are explained individually in as much detail as this type of report will allow.

Section D consists of the composition of the resultant inventory showing the amount of material in use and the amount in storage. It also indicates the physical state.

Section E consists of the composition of the U-235 inventory. The uranium weight, the U-235 weight, the program in which each sample of the material is being used is shown.

2. The report is prepared in triplicate, classified, and submitted to the Assistant Laboratory Director for approval. One copy of the approved form is returned to the Special Materials Department and the remaining copies are forwarded to the OCDO Accountability office.

---

1. Brief explanation of ANL documents and forms used in handling shipments of special materials of the kind in question.

2. Four special materials passes covering shipment supposedly including material in question which, however, later was found to have been left at Site B.

JUNE 7, 1949.

#### IDENTIFICATION ANL DOCUMENTS AND FORMS

1. *Form No. MP-151 or ANL-151—Special materials pass.*—This pass is used to move special materials (as defined in CA-2686) between guarded areas. The ANL is located in a number of different isolated buildings (sites), each building having only certain designated entrances and exits through which personnel and material may enter or leave. At each one of those entrances and exits an armed guard is stationed to check identity of personnel and control flow of material. In order to move material between one guarded area and another it is necessary that a pass (MP-151) accompany each lot. The particular form noted above is used only for special material packages and can only be signed by authorized persons. The information contained on the pass is sufficient for the guard to identify the packages. The use of this pass usually requires that the material should be accompanied by an armed guard or courier between the sites, or satisfactory arrangements be made for its safety or the safety of the people handling it. This pass cannot be used for shipping material outside the laboratory. In conclusion, it is only used for the transfer of special materials between ANL sites under carefully regulated conditions. Form MP-151 does not constitute transfer of accountability of the material being transferred.

[NOTE.—The bottle was supposedly in the carton. The carton moved from Site B to New Chem.—on special materials pass Serial No. A-3681; and from New Chem. to Site A—on special materials pass Serial No. A-8974.]

2. *Form MP-95—Product request and transfer.*—This form is used to transfer accountability of the product (fissionable materials) between sections of the laboratory which are charged with accountability. In the past it has also been used as a record device to transfer accountability for material between the laboratory and the local AEC office. Thus, when properly executed, it serves as a credit for the releasing section and a debit for the receiving section. The form is signed by only authorized persons having the necessary authority to act in these matters. The form has recently been supplemented by a new one which is now coming into use. The letters MP indicate Metallurgical Project and were originally set up by the original organization in 1943 or 1944.

[NOTE.—In the attached forms, the particular shipment in question was described as a "cardboard box" in MP-151 and as a "carton" in ANL-151.]

3. *Report on chemical analysis.*—This is a form used by the Analytical Section of Chemistry C-2 for reporting the analytical results of samples submitted to them. Copies are furnished to the requestor. This form is primarily used for "wet" analysis chemistry.

4. *Spectro-chemical analysis report.*—This form is used for the spectro-chemical analysis group to report results of their analyses of materials submitted to them. (This work is usually done on an emission spectrograph.)

5. *Kardex form for product control.*—These cards are used by the Special Materials section of the laboratory to record the accountability status for all of special materials in the custody of the laboratory. The card indicates each transaction between accountability sections affecting the material, the section to which it is charged, and it should contain complete identification data.

UNITED STATES ATOMIC ENERGY COMMISSION,  
Washington 25, D. C., June 10, 1949.Mr. WILLIAM L. BORDEN,  
Executive Director, Joint Committee on Atomic Energy,  
Washington, D. C.

DEAR MR. BORDEN: Attached is a summary report of emergency clearances granted by AEC for 1947, 1948, and January to March, 1949. This information was requested by Senator Knowland at page 126 of the printed hearings of the current hearings, and referred to for insertion at page 127.

The figures are broken down by sites throughout, as well as between those clearances carrying access to restricted data and those that do not carry such access. From July 1948 to March 1949 an additional break-down is furnished between direct employees of AEC and employees of contractors.

\* \* \* \* \*  
Sincerely yours,C. SHUGG,  
For CARROLL L. WILSON,Enclosures:  
Reports of emergency clearances granted.

<sup>1</sup> Beginning with the month of October all emergency clearances listed were granted by the Managers of Operations under Authority of GM Bulletin 101.

NOTE.—For the purposes of this report an emergency clearance is defined as follows: (a) Clearance of any direct employee of AEC with or without access to "restricted data"; and (b) clearance of any contractor's employee, prospective contractor, consultant, or employee of any other Government agency, with access to "restricted data," prior to full FBI investigation. Emergency clearances are granted only after the duties for the job for which emergency clearance is requested have been specified and the clearance specifically states that access is granted only to information required in the performance of these duties. Clearance under the Interim Security measures for the Armed Forces, issued May 23, 1948, are not included.

**EMERGENCY CLEARANCES RECORDED IN COMMISSION MINUTES**

Meeting No. 1, November 13, 1946; 5 emergency clearances recorded (Internal Administrative Order No. 4).

Meeting No. 4, November 26, 1946; 15 emergency clearances recorded (Internal Administrative Order No. 6).

Meeting No. 5, December 2, 1946; 10 emergency clearances recorded (Internal Administrative Order No. 7).

Meeting No. 7, December 5, 1946; 2 emergency clearances recorded (Internal Administrative Order No. 8).

Meeting No. 11, December 17, 1946; 8 emergency clearances recorded (Internal Administrative Order No. 10).

Meeting No. 72, July 3, 1947; 1 emergency clearance recorded.

In addition to these clearly identified instances of emergency clearance there are two other Commission clearance actions in which it is not certain whether the action was an emergency clearance or a Commission permission for an already cleared individual to have access to closely held weapons data:

Meeting No. 65, June 17, 1947; 9 emergency clearances recorded.

Meeting No. 75, July 9, 1947; 1 emergency clearance recorded.

## ATOMIC ENERGY PROJECT

## EXHIBIT 5

(See also exhibits 9 and 10)

(Referred to on p. 126, pt. 3, June 2, 1949)

## ATOMIC ENERGY COMMISSION

## INTERNAL ADMINISTRATIVE ORDER NO. 13—PERSONNEL EMPLOYMENT

During the period of organization of the Commission's staff, whenever the General Manager shall find that it is essential to the efficient performance of the Commission's duties under the Atomic Energy Act of 1946 to employ an individual, within the Commission's headquarters, before full investigation and report by the Federal Bureau of Investigation of the character, associations, and loyalty of such individual can be obtained, and the General Manager shall further find—

(a) That it is impractical to obtain for the position contemplated the services of a qualified person who prior to January 1, 1947, shall have been employed by, or permitted access to restricted data by, the Manhattan Engineer District; and

(b) That a preliminary report on such individual by the Federal Bureau of Investigation based on a file and fingerprint check shall not have disclosed any information derogatory of the character, associations, or loyalty of such individual

the Commission hereby declares the employment of such individual to be a case of emergency within the meaning of Section 10 (b) (5) (B) (ii) of the Atomic Energy Act of 1946 and the General Manager is hereby authorized to employ such individual; provided, that the Federal Bureau of Investigation shall be requested to make a full investigation and report as soon as possible on the character, associations, and loyalty of such individual and that the continued employment of such individual shall be conditioned upon the results of such investigation and report.

This order shall remain in effect until March 31, 1947, unless sooner revoked by the Commission.

By order of the Commission:

DAVID E. LILIENTHAL,  
*Chairman.*

Dated: January 27, 1947.

## ATOMIC ENERGY COMMISSION

## INTERNAL ADMINISTRATIVE ORDER NO. 16—PERSONNEL EMPLOYMENT

Internal Administrative Order No. 13 authorizing the General Manager to employ individuals in case of emergency as defined in Section 10 (b) (5) (B) (ii) is hereby extended and shall remain in effect until revoked. All emergency clearances heretofore authorized by the General Manager in conformity with the provisions of said order are hereby ratified.

By order of the Commission:

DAVID E. LILIENTHAL,  
*Chairman.*

Dated: May 29, 1947.

## ATOMIC ENERGY COMMISSION

## INTERNAL ADMINISTRATIVE ORDER NO. 19—PERSONNEL EMPLOYMENT

1. Whenever the General Manager shall find that it is essential to the efficient performance of the Commission's duties under the Atomic Energy Act of 1946 to employ an individual before full investigation and report by the Federal Bureau of Investigation of the character, associations, and loyalty of such individual can be obtained, and the General Manager shall further find—

(a) That it is impracticable to obtain for the position contemplated the services of a qualified person who prior to January 1, 1947, shall have been employed by, or permitted access to restricted data by, the Manhattan Engineer District; and

(b) That a preliminary report on such individual by the Federal Bureau of Investigation based on a file and fingerprint check shall not have disclosed any information derogatory of the character, associations, or loyalty of such individual.

The Commission hereby declares the employment of such individual to be a case of emergency within the meaning of Section 10 (b) (5) (B) (ii) of the Atomic Energy Act of 1946 and the General Manager is hereby authorized to employ or authorize the employment of such individual; provided, that the Federal Bureau of Investigation shall be requested to make a full investigation and report as soon as possible on the character, associations, and loyalty of such individual and that the continued employment of such individual shall be conditioned upon the results of such investigation and report.

2. The authority contained in this Order may be redelegated by the General Manager to Admiral John E. Gingrich, Director of Security and Intelligence.

3. This order shall remain in effect until revoked by the Commission. Internal Administrative Orders Nos. 13 and 16 are hereby revoked.

By order of the Commission :

DAVID E. LILIENTHAL,  
*Chairman.*

Dated : October 15, 1947.

APRIL 23, 1948.

MEMORANDUM

To: Director of Security and Intelligence.

From: Carroll L. Wilson, General Manager.

Subject: Delegation of Authority—Emergency Clearances, Contractor Personnel.

1. Whenever you shall find it to be in the interest of the common defense and security to authorize or direct Commission contractors to grant access to restricted data to a certain individual who is employed by such a contractor, prior to the completion of an investigation and report to the Commission by the Federal Bureau of Investigation on the character, associations, and loyalty of such individual; and you shall further find:

(a) That an operation essential to the Commission's programs cannot be performed properly unless access to "restricted data" is granted to the individual employee who will perform the operation; and

(b) That it is essential to the Commission's programs that such operation be performed or commenced prior to the completion of an investigation and report to the Commission by the FBI on the character, associations, or loyalty of such individual employee; and

(c) That it is impracticable to obtain to perform such operation prior to the completion of such report and investigation a qualified person who was permitted access to "restricted data" by the Manhattan Engineer District or who has previously been cleared for access to "restricted data"; and

(d) That a preliminary report on the individual employee by the Federal Bureau of Investigation based on a file and fingerprint check shall not have disclosed any information derogatory of the character, associations, or loyalty of such individual

you are authorized to authorize or direct the contractor to grant access to "restricted data" to such individual, provided, that the Federal Bureau of Investigation shall be requested to make a full investigation and report as soon as possible on the character, associations, and loyalty of such individual and that the continued access of such individual to "restricted data" shall be conditioned upon the results of such investigation and report.

2. The authority herein delegated shall be exercised only by the Director of Security and Intelligence and may not be redelegated.

3. This delegation shall remain in effect until revoked by the General Manager.

CARROLL L. WILSON,  
*General Manager.*

## ATOMIC ENERGY COMMISSION

Bulletin  
GM-101Security and Intelligence  
Personnel ClearancesDECENTRALIZATION OF AUTHORITY TO GRANT TEMPORARY SECURITY CLEARANCES UNDER  
EMERGENCY CONDITIONS

Ref: Amends General Manager's letter of February 14, 1947, subject: "Personnel Clearance"; amends memorandum from Director of Security and Intelligence to Managers of Operations and Area Managers dated April 20, 1948; amends memorandum of May 24, 1948, from Director of Security and Intelligence to Managers of Operations; rescinds letter of May 10, 1948, from Director of Security and Intelligence to Managers of Operations; and paragraph 2 of Bulletin GM-85.

For: Managers of Operations.

1. *Purpose.*—This Bulletin decentralizes to the Managers of Operations authority to grant emergency clearances and provides the standards and procedures which shall be followed.

2. *Delegation of Authority.*—(a) The authority herein delegated shall be exercised by the Managers of Operations or, in the absence of the Managers of Operations, their deputies, and may not be redelegated.

(b) Whenever it shall be found that it is indispensable to the accomplishment of the Atomic Energy Commission's duties under the Atomic Energy Act of 1946 to employ an individual directly or to authorize the granting of access to restricted data to any individual not directly employed by the Atomic Energy Commission prior to completion of an investigation and report to the Atomic Energy Commission by the Federal Bureau of Investigation on the character, associations and loyalty of such person or persons, the employment of such an individual or the granting of access to restricted data to such an individual may be authorized; provided, that the Federal Bureau of Investigation shall be requested to make an investigation and report to the Atomic Energy Commission, on the character, associations and loyalty of such person or persons, and the continued employment of such person or persons, or the continued access to such person or persons to restricted data shall be conditioned upon the results of such investigation and report. In granting temporary security clearance under emergency conditions, the Manager of Operations shall make the following determinations:

(1) That an operation essential to AEC programs cannot be performed properly unless an individual be employed, or unless access to restricted data is granted to an individual who will perform the operation.

(2) That it is essential to AEC programs that such operation be performed or commenced prior to completion of such an investigation and report to the Atomic Energy Commission by the Federal Bureau of Investigation.

(3) That it is impracticable to obtain to perform such operation the services of a qualified person who has previously been cleared for access to restricted data by the Atomic Energy Commission.

(4) That available information, including any or all of the following, shall not have disclosed derogatory information: the Personnel Security Questionnaire; evaluation by responsible character references; file and fingerprint check by the Federal Bureau of Investigation; and any other data as to the character, associations or loyalty of such individual.

3. *Documentation.*—Each request made for temporary security clearance under emergency conditions must be made by a letter of request for such appointment, prepared in conformity with Exhibit I. This letter shall be accompanied by the documents containing the available information referred to in paragraph 2 (b) (4) above, including a certification as to favorable review of the Personnel Security Questionnaire, receipt of a favorable report of Central FBI file and fingerprint search, and initiation of investigation (Exhibit II), except as provided in paragraph 4. The granting of each temporary security clearance shall be authorized in writing by the Manager of Operations in the form provided as Exhibit III.

4. *Exceptional cases.*—Only under extraordinary circumstances shall any request for temporary clearance be processed without certification by the local security office that a favorable Central FBI file and fingerprint search has been

received, and that an investigation has been initiated. Exceptions may be made, but only upon specific instruction by the Manager of Operations prior to the processing of a request, as to the documentation which will be accepted by him. In such cases, immediate steps will be taken by the local security office to initiate the investigation.

5. *Allocation of Responsibility.*—(a) *Security Officer:* Security Officers designated by the Manager of Operations will be responsible for processing, recording, reviewing, and reporting upon requests for temporary security clearance.

(b) *Area Managers:* Area Managers designated by the Manager of Operations shall review and recommend approval for requests for temporary security clearance relating to appointments under the security jurisdiction of the respective area offices.

(c) *Managers of Operations:* Managers of Operations will designate the Area Offices and operating security offices which will assume the foregoing responsibilities. Managers of Operations shall maintain a record of temporary security clearances granted by them and shall submit a report for each calendar month by the fifth day of the following month. This report shall be submitted to the Personnel Security Branch, Washington Headquarters. Data shall be separate for the Office of Operations and the Area Offices, and shall be in conformity with Form AEC-244, attached as Exhibit IV.

(d) For purposes of this Bulletin, the Assistant General Manager shall act as Manager of Operations in the Washington Area.

6. *Procedural Guides.*—There are attached as Exhibits I to VII, inclusive, procedural guides for the processing and documentation of temporary security clearances under emergency conditions.

CARROLL L. WILSON, *General Manager.*

*Exhibit I*

(Form letter for Use in Requesting Emergency Clearances. Emergency Clearance Request Number to be inserted by Operating Security Office. Employing organization prepares original and two copies; forwards original and one copy to AEC Operating Security Office, which will retain one copy and forward original with supporting papers to the Area Manager.)

Emergency Clearance Request No. ———.

To: Manager of Operations.

Through: Area Manager.

From: (Head of employing organization; either AEC office or division, or contractor.)

Subject: (Name of individual to be cleared and AEC number.)

Request is made for temporary security clearance of the above-named individual for employment with access to restricted data under emergency conditions, in accordance with the provisions of the Atomic Energy Act of 1946, prior to completion of a full investigation and report to the Atomic Energy Commission on his character, associations and loyalty.

(The letter will be continued to provide information and certification as to the following:)

(a) That an operation (describe) essential to AEC programs cannot be performed properly unless an individual be employed, or unless access to "restricted data" is granted to an individual who will perform the operation.

(b) That it is essential to AEC programs that such operation be performed or commenced prior to completion of such an investigation and report to the Atomic Energy Commission by the Federal Bureau of Investigation.

(c) That it is impracticable to obtain to perform such operation the services of a qualified person who has previously been cleared for access to "restricted data" by the Atomic Energy Commission.

(d) That the required Personnel Security Questionnaire and fingerprint cards are attached.

Approved:

-----  
(Area manager)

### *Exhibit II*

(Recommendation for approval of temporary security clearance and certification as to receipt of a favorable report of central FBI file and fingerprint search, and initiation of investigation. Operating Security Office prepares original and two copies, retains one copy and forwards original and one comeback copy to Area Manager together with supporting papers. Security Office will initial the comeback copy. Area Manager returns comeback copy to Security Office and transmits original to Manager of Operations with supporting papers.)

#### MEMORANDUM

Emergency Clearance Request No. ———.

To: Manager of Operations.

From: Area Manager.

Attached is the letter requesting the above-numbered temporary security clearance, together with the available information required in this case.

The letter will be continued to provide certification as to the following:)

(a) Concurrence in the statements that emergency conditions exist which require temporary security clearance.

(b) That a favorable report of central FBI file and fingerprint search has been received and an investigation has been initiated.

(c) That the Personnel Security Questionnaire has been favorably reviewed.

(d) That approval of the request is recommended.

[NOTE.—Where the request is being processed as an "exceptional case," this letter should be prepared by the Area Manager in accordance with prior agreement with the Manager of Operations. The letter shall include specific reference to the available information deemed acceptable in the case.]

### *Exhibit III*

(Operating Security Office prepares a letter for signature of the Manager of operations granting temporary security clearance. Letter is prepared in original and three copies. Operating Security Office retains one copy and forwards original and two copies to the Area Manager attached with other supporting papers to Exhibit II.)

#### MEMORANDUM

Date: —————

To: Area Manager (Attention: Operating Security Office).

From: Manager of Operations.

Subject: Emergency clearance for.

Temporary security clearance is hereby granted to the above-named individual for employment with access to restricted data under emergency conditions, in accordance with the provisions of the Atomic Energy Act of 1946, pending completion of a full investigation and report to the Atomic Energy Commission on his character, associations, and loyalty.

Access is limited to restricted data in connection with subject's duties as (describe job).

\_\_\_\_\_  
Manager of Operations.

The report shall be broken down by offices and the names listed in alphabetical order.</p>		

**Exhibit V**

## GUIDE FOR SCREENING AND REVIEWING PERSONNEL SECURITY QUESTIONNAIRE

Carefully used, the PSQ constitutes an effective means for judging the eligibility of applicants. Area Managers should make recommendations for acceptance or rejection, and Managers of Operations should base their decisions in part on careful screening of the PSQ. The following items may be significant in reaching a decision by the Area Manager and Manager of Operations.

The Personnel Security Questionnaire shall be *screened* immediately in the operating security office in accordance with this guide. Full investigation may be recommended in the first instance to the Area Manager by the Security Office, where doubt as to eligibility for temporary security clearance is established. It should be clearly understood that even though an individual may be ineligible for temporary security clearance, this does not mean, of necessity, that clearance will be withheld when a full investigation has been completed.

1. *Incomplete Personnel Security Questionnaires.*—The Personnel Security Questionnaire shall be carefully examined for completeness. Incompleteness must usually be considered unacceptable by the screener since there is no way of determining whether the omission was careless or deliberate.

2. *Discrepancies in Personal History.*—(a) An irregular pattern of education.

(1) The date of birth should be compared with dates of education, residence, employment, and military service.

(b) An irregular or incomplete pattern of residence.

(1) Location of residence and dates of residence should be compared with location and dates of schooling, military service, and employment.

(c) An irregular, incomplete, or questionable pattern of employment.

(1) Location and dates of employment should be compared with location and dates of schooling, military service, and residence.

(2) There should be a complete and consistent accounting of the periods of time during which various occupations are claimed.

(d) Discrepancy as to citizenship.

(1) The date and place of birth must be consistent with the citizenship status claimed, either by birth, derivation, or naturalization ; place and dates of residence of the individual's parents.

(e) Discrepancy as to military service record where applicant was within age of eligibility for military service.

(1) A service record or record of no service should be entered.

(2) Where military service is claimed, the branch of service and the service serial number should be entered.

(3) Where no service is indicated, a satisfactory accounting for residence and employment should appear.

3. *Questionable circumstances.*—(a) Citizenship in a country other than the United States. (The approval of the Director of Security and Intelligence is required before a request for clearance may be submitted on an alien.)

(b) Recent naturalization of an individual and particularly those holding prior citizenship in countries which are Communist or Fascist, or which are Communist, Fascist, or otherwise subject to totalitarian domination.

(c) Close relatives residing in foreign countries which are hostile to or unsympathetic with the democratic form of government.

(d) Membership in organizations which are reported to be infiltrated by Communists and Fascists, or which are dominated by such individuals or their "fellow travelers."

(e) Previous employment with industrial, social, civic, commercial, or other bodies which are known to promote theories or beliefs opposed to the democratic form of government, or where the employer knowingly employs individuals who support such ideologies.

(f) Schooling in institutions known to teach totalitarian ideologies or to endorse organizations and groups promoting ideologies and theories of government opposed to democratic principles, or serving as an instructor in such institutions.

(g) Listing as references individuals known to be of questionable character or who support beliefs and ideologies opposed to democratic principles or who are known to be members of groups opposing such principles.

(h) Listing of references whose association with the applicant has been of brief duration.

(i) Visits to foreign countries during recent years without supplying an adequate and satisfactory statement as to the purpose of such visits.

(j) An arrest record indicating criminal tendencies or emotional or moral instability.

(k) Falsification in any manner of the Personnel Security Questionnaire.

(l) Any information regarded as substantially derogatory as defined in present criteria.

### Exhibit VI

#### PROCESSING TEMPORARY SECURITY CLEARANCE ACTIONS

The following are basic procedural requirements for processing temporary security clearances under emergency conditions.

1. Requests are based upon file, and fingerprint search shall be received by the local Security Office and processed in the following manner:

(a) *Security officer.*—(1) An AEC Security file will be opened and an Emergency Request Number as well as an investigation file number will be assigned. Duplicates of all documents pertaining to the request will be added to and retained in this file at all times.

(2) Unless otherwise indicated by the Area Manager, a full background investigation will be initiated immediately requesting a Q investigation in the E category.

(3) The PSQ will be screened on the basis of the guide provided as Exhibit V, and a notation shall be made on the PSQ as to favorable or unfavorable screening. The action will remain pending until the return of the results on the file and fingerprint searches.

(4) On receipt of the file and fingerprint searches the file will be forwarded to the original screener who will make a determination as to advisability of granting the request.

(a) Where favorable, a letter of certification (Exhibit II) will be prepared for the signature of the Area Manager, record copy (comeback) to be initialed by the Security Officer; and a letter of approval (Exhibit III) addressed to the Area Manager, attention the Security Office, will be prepared for the signature of the Manager of Operations. The letters and copy of the PSQ will be forwarded to the Area Manager.

(b) Where the determination is unfavorable, the original screener will prepare a rejection letter (Exhibit VII) for the signature of the Area Manager. The file (PSQ) and the letter will be forwarded to the Area Manager.  
 (5) Transactions will be returned (and appropriately processed and recorded) as follows:

(a) Comeback copies on all transmittals direct from the Office Area Manager; and, files attached to comeback copy of letters of rejection.

(b) Letters granting approval by the Manager of Operations together with the file of supporting papers.

(c) Unsigned letters of approval, of rejection of certification with instruction as to further processing.

(6) Where the requesting official withdraws the request for clearance subsequent to rejection of request or denial of temporary security clearance, the Security Office will notify PSB of cancellation of request for clearance by No. 2 card. Where the request for clearance is not withdrawn, no notice will be given to PSB.

(b) *Area manager.*—(1) Letters recommending approval with be forwarded with all documents attached when signed, to the Manager of Operations. Otherwise they will be returned to the Security Officer with appropriate notation as to rejection or procurement of additional information and reprocessing.

(2) Letters of rejection, when signed, will be forwarded to the requesting official, and the file returned to the Security Officer with the comeback copy of the dispatched letter. Otherwise they will be returned to the Security Officer, with appropriate notation as to procurement of additional information and reprocessing.

(c) *Manager of Operations.*—(1) Each transaction will be registered and controlled in accordance with reporting requirements (Exhibit IV).

(2) Letters of approval, when signed, will be returned to the Area Office together with all attached documents, except one copy of the letter of approval.

(3) Cases of denial of temporary security clearance will be returned with appropriate instruction together with all attached documents.

2. Requests based upon PSQ review, without file and fingerprint search, shall be processed in the same manner as in paragraph 1 above except that the Security Officer will cause an immediate screening determination to be made, and process the case without awaiting report on file and fingerprint search.

3. Requests based upon biographical data or other information under special circumstances other than as classified in paragraphs 1 and 2 above: Under extraordinary necessity and only by prior agreement between the Area Manager and the Manager of Operations may such special requests be processed. In all such cases, the Manager of Operations will instruct as to the documentation acceptable to him in the case. Further, the Security Officer will immediately forward and follow through a memorandum requesting the required PSQ's and fingerprint cards, and initiate the full background investigation.

#### Exhibit VII

(Letter from Area Manager rejecting requesting for Temporary Security Clearance. Operating Security Office will prepare an original and two copies; retain one copy and forward original and one copy to Area Manager. Upon dispatch, record copy and file shall be returned to the Operating Security Office.)

#### ATOMIC ENERGY COMMISSION

In reply refer to:

Attention: (Office which requested emergency clearance.)

Subject: (Name)

Reference is made to your Emergency Clearance Request No. ——— for the above named Subject.

A review of Subject's file as of this date makes it advisable to have a full background investigation at hand before any clearance action is taken.

Accordingly, emergency clearance on this individual will not be processed, but it should be clearly understood that this action does not mean, of necessity, that clearance will be withheld when a full investigation has been completed.

Please advise this office immediately whether the full background investigation on this request should be continued.

Very truly yours,

Area Manager.

## EXHIBIT 6

(Referred to on p. 127, pt. 3, June 2, 1949; see also p. 751, pt. 17, June 29, 1949)

UNITED STATES ATOMIC ENERGY COMMISSION,  
Washington 25, D. C., June 29, 1949.

HON. BRIEN MCMAHON,  
Chairman, Joint Committee on Atomic Energy,  
United States Capitol, Washington 25, D. C.

DEAR SENATOR MCMAHON: There is transmitted herewith, in accordance with your request, for inclusion as Exhibit 6 in the Appendix of the hearings before the Joint Committee on the investigation into the administration of the Atomic Energy Project, a compilation of data from the records of the Commission in Washington and the Field Operations Offices. This compilation, which presents certain aspects of emergency clearances for access to "restricted data" granted by the Commission between the dates of January 1, 1947, and May 31, 1949, has been developed in response to the specific inquiries made by the Chairman of the Committee and by Senator Knowland on pages 126 and 127 (pt. 3, June 2, 1949) of the published transcript.

While, in many respects, the statistics in the attached compilation speak for themselves, we feel that it would be useful to have in the record the brief comments about them prepared by the Commission's staff and marked "Explanatory Statement." We would, therefore, appreciate having this letter and the statement included as a part of Exhibit 6, along with Tables I, II, and III.

Sincerely yours,

UNITED STATES ATOMIC ENERGY COMMISSION,  
DAVID E. LILIENTHAL, *Chairman*.

Attachments:

Tables I, II, and III.  
Explanatory Statement.

TABLE I.—*Cases in which emergency clearances were granted to prospective contractors as basis for contract negotiations or to official visitors requiring access to restricted data, during the period beginning Jan. 1, 1947, and ending May 31, 1949*

Ames.....	0	0	Dayton.....	0	0
Berkeley.....	3	0	Santa Fe.....	1	0
Hanford.....	2	5	Los Angeles.....	1	8
Schenectady.....	0	0	Sandia.....	0	3
New York.....	3	0	Washington.....	2	3
Brookhaven.....	0	0			
St. Louis.....	0	0	Total.....	15	22

## NOTES

- (1) Number of additional cases where termination was voluntary and before information was discussed with subject: 6.  
 (2) Number of additional cases where subject never entered on duty: 5.  
 (3) Number of additional cases where a short-term commitment was not renewed: 2.  
 (4) Additional case where there was no separation other than a short-term suspension: 1.  
 (5) Pending: 4.

## COMMENTS

- (1) In nine cases, information included some indication of association with persons or groups alleged to be subversive or to have subversive tendencies; no espionage suspects.  
 (2) In the majority of the other cases where involuntary terminations occurred, the action was based on reports of character deficiencies, evidenced in the most part by sexual irregularities, alcoholism, or falsification of employment questionnaires, usually with respect to previous arrest records.  
 (3) In 21 cases, information having derogatory implications was developed in the full FBI investigation but, upon further investigation and/or extension of the record, class "Q" clearance was ultimately granted. These cases are, of course, not included in the table or notes above.

**TABLE III.—Cases in which emergency clearances were granted and in which the person being investigated by the FBI voluntarily terminated employment on AEC work before completion of the full FBI investigation**

Area	AEC	Con- tractor	Area	AEC	Con- tractor
Chicago.....	0	0	Oak Ridge.....	7	0
Ames.....	0	0	Dayton.....	0	0
Berkeley.....	0	0	Santa Fe.....	3	0
Hanford.....	3	16	Los Angeles.....	0	1
Schenectady.....	0	0	Sandia.....	0	4
New York.....	1	5	Washington.....	4	1
Brookhaven.....	0	2			
St. Louis.....	0	0	Total.....	18	29

## NOTES

- (1) In 14 of the above cases, no information having derogatory implications was developed in the full FBI investigation which was carried to completion.  
 (2) In 27 of the above cases, the FBI investigation was discontinued prior to completion but no information having derogatory implications had been developed prior to discontinuance.  
 (3) In the remaining 6 cases, information having derogatory implications was developed after the subject had voluntarily terminated employment on AEC work. In one of these cases, there was an allegation that the subject had been active in Communist circles; in the five others, the information related to alcoholism, previous arrest record, or, in one case, an allegation that the subject was willing to sell his vote.

## EXPLANATORY STATEMENT

(To accompany tables I, II, and III)

As was pointed out in the hearings before the Joint Committee in the discussion of emergency clearance procedure on June 2, 1949, emergency clearance for access to "restricted data" is granted only in cases where delay in granting access, in order to allow time for completion of a full field investigation by the FBI, would impede the progress of the program to an extent which, on balance, would be more harmful to the security of the country than granting access on the basis of the information already available.

In table II are listed the 37 cases out of 4,095 in which, after an emergency clearance had been granted, information having some derogatory implication was developed by the full FBI investigation and, on the basis of such information, an involuntary termination of the individual's employment on AEC work occurred. In two additional cases, mentioned in Note (3), short-term commitments for advisory services were not renewed because of such information. Of these 39 cases, none involved espionage or suspicion of espionage. Thirty involved reports of character deficiency evidenced in the most part by allegations of alcoholism, sexual misconduct, or the falsification of employment questionnaires, usually with respect to previous arrest records. Thus in only nine emergency clearance cases has an individual's employment on

atomic energy work been terminated because of information turned up in the full FBI investigation which indicated the possibility of associations with questionable persons or groups.

The fact that only nine such cases occurred is, first of all, a credit to the effectiveness of the practice of obtaining a preliminary check of FBI files before emergency clearance is granted. It is more important, however, as a measure of the limited nature of the risk involved in granting emergency clearances under the safeguards of the Commission's established procedures. The facts in these nine cases are even more illuminating: Five of the nine persons, although temporarily cleared, were never in fact given access to "restricted data" during the short periods they were employed. The sixth, a boilermaker-welder on a construction job had access to an exclusion area, but no access to technical or statistical data itself. The derogatory information about the seventh, a consultant to one of the Commission's contractors for a period of slightly more than two months, was that his son had had "fringe" associations during student days not later than 1944; no similar associations or leanings were ascribed to the father. The individual in the eighth case was alleged to have signed a Communist Party nominating petition in 1941; this he categorically denied and further investigation by the FBI resulted in a finding by handwriting experts that substantial discrepancies exist between the signature on the petition and his true signature. Only the ninth case involved reasonably well-confirmed evidence of membership in or association with the Communist Party. The individual concerned is an accountant who was cleared to work in a plant which processes a material having technical specifications of some security significance. The extent to which such specifications would be available to a member of the accounting staff is conjectural. There is considerable evidence in the file that Case No. 9 is a loyal citizen and there is none that espionage was attempted, or even contemplated.

In Table III are listed the 47 cases in which emergency clearances were granted and in which the person being investigated by the FBI voluntarily terminated his employment on AEC work before completion of the full FBI investigation. It should be noted here that the mere fact of such a voluntary departure from the program carries with it no implication that the departure was to avoid the consequences of an unfavorable investigation report. In 41 of these 47 cases, no information having derogatory implications was developed in the full FBI investigation. In five of the remaining six cases, the derogatory information related solely to alcoholism, previous arrest records and, in one case, an allegation that the employee was "willing to sell his vote." In the sixth case, where the derogatory information was that the contractor's employee involved had been active in Communist circles, the employee was not in fact ever given access to restricted data.

---

### EXHIBIT 7

(Referred to on p. 128, pt. 3, June 2, 1949)

(From the FIRST REPORT OF THE SECRETARY OF DEFENSE, 1948—P. 16)

"I want to record my personal satisfaction with the existing statute governing matters in the field of atomic energy, and to express my pleasure, also, at the way in which relationships between the National Military Establishment and the Atomic Energy Commission are being conducted."

---

UNITED STATES ARMY, PACIFIC, APO 958, 28 May 1948.

*The Commanding General*

Mr. DAVID E. LILIENTHAL,  
Chairman, Atomic Energy Commission,  
Washington 25, D. C.

MY DEAR MR. LILIENTHAL: Your nice note of May 17 has just reached me, and I find it difficult to express in words my appreciation for it. I am indeed happy to feel that our efforts at Eniwetok have met with your approval.

The success of Operation Sandstone was due to the individual efforts of all concerned. I have never been associated with a finer group of people than those connected with this operation. The support we received from everyone in this operation, and particularly the Atomic Energy Commission, left nothing to be desired. You leaned over backwards to meet our every request and I want you to know that, along with everyone else in the Task Force, I deeply appreciate your support.

With kindest personal regards,  
Sincerely,

J. E. HULL,  
Lieutenant General, United States Army,  
Commanding.

---

STATEMENT OF LT. GEN. JOHN E. HULL, COMMANDER, JOINT TASK FORCE SEVEN,  
AT PRESS CONFERENCE, HEADQUARTERS, USARPAC, FORT SHAFTER, T. H., MAY  
18, 1948

Joint Task Force Seven has successfully completed its mission as assigned by the Joint Chiefs of Staff. This mission was dual in character. First, it was the mission of the Task Force to construct an atomic energy proving ground for

the Atomic Energy Commission at Eniwetok. Secondly, it was required that we assist the AEC in the conduct of the first series of tests of atomic weapons during the months of April and May.

The Task Force had completed the construction of the proving ground by April, in time to permit the conducting of the tests as scheduled. In general, this involved the construction and rehabilitation of housing and living facilities for the scientific group and for troops. Installation of utilities, water, power, and communications was required. Fortunately, we were able to use existing structures, left over from the war, mostly quonset-type buildings, at the proving ground for housing personnel and for storage and work shops; after repairs, of course. Some equipment was repairable, for instance refrigerating equipment. Considerable savings resulted from these efforts. It was necessary to repair air strips to permit the landing of heavy planes, including C-54's, B-29's and B-17's. Landing facilities for small water craft had to be provided, although cargo had to be off-loaded on lighters from the transport ships.

Construction of the actual testing ground involved special construction for the placement of various scientific instruments and test equipment.

These tests had no kinship to the Bikini tests, the purpose of which was to test the effect on naval equipment and other materials as well as animal and marine life. In the words of the directive given to the Commander of Joint Task Force One, the purpose of the Bikini test was to determine "the effects of atomic explosives against naval vessels in order to appraise the strategic implications of atomic bombs including the results on naval design and tactics." We did not conduct the postponed underwater test Charlie.

The tests of Operation Sandstone were literally and truly field laboratory tests, designed to determine how the bombs now under development by the United States would work and to determine their efficiency. We did just that. We got our answers. We liked the answers. These answers belong to the United States Government and, naturally, are not for publication. It can be said, however, that the bombs worked. We have proved the weapon-development work done by the Los Alamos Scientific Laboratory during the past 2 years.

This job which we have just completed was begun on 3 April 1947 when the General Advisory Committee of the Atomic Energy Commission concurred in the recommendation of the Los Alamos Scientific Laboratory that tests of certain new designs of weapons be conducted in 1948. The Commission requested and received the President's approval to go ahead with the program in June 1947.

\* \* \* \* \*

In September 1947 preparations had progressed to the point where formation of a Joint Task Force was directed. Joint Task Force Seven actually came into being on October 13, 1947.

As a military organization, Joint Task Force Seven is unique. It was organized along the lines of our best wartime experience, but there was an additional element. As a part of the organization we had a Task Group which was essentially civilian in make-up. This was the Scientific Group which conducted the actual tests and which recorded and is still analyzing the results. Captain Russell, who is Deputy Director of the Division of Military Application of the AEC, headed this Task Group as Test Director, and Doctor Darol K. Froman, as Scientific Director for the Proving Ground, headed the Task Unit of scientists within the Task Group. Through Captain Russell, the scientific unit operated technically under the AEC. This Task Group, by common consent, did not work through my staff. The channels between Captain Russell, Dr. Froman, and myself were direct. Dr. Alvin C. Graves served as Deputy Director to Dr. Froman and Mr. Robert W. Henderson and Dr. John C. Clark were Assistant Scientific Directors—all from the Los Alamos Laboratory.

The operation of Joint Task Force Seven, thus organized, was the ultimate in integrated effort and embodied our present-day concept of preparedness—this is the concept we are currently teaching at the National War College—the integrated effort of the Armed Forces with civilian scientists and other specialized civilian elements.

It is a tribute to the scientists who were members of the Task Force that the Operation was successful. The mixing of civilian and military elements in the past sometimes has reacted like oil and water. Joint Task Force Seven was a unified team. Successful accomplishment of its mission was the result of an integrated effort. Much credit for this accomplishment is due Dr. Froman. It has been a real pleasure to have been associated with him on this project.

I am sorry that Dr. Norris E. Bradbury, Director of the Los Alamos Laboratory is not here, but I want to say for his benefit that if the men under Doctor Froman are typical of the Los Alamos organization, the research and development in the field of nuclear weapons is in good hands.

All of us have been equally impressed with the scientific competence, the technical skill, and the sound judgment of the civilian scientists and technicians assembled for these tests. Our close association has been valuable in many respects and, I am sure, paves the way for a continuing and increasing cooperative effort to insure the common defense and security of the people of the United States. \* \* \*

STATEMENT OF DR. DAROL K. FROMAN, SCIENTIFIC DIRECTOR, JOINT TASK FORCE SEVEN, AT PRESS CONFERENCE, HEADQUARTERS, USARPAC, FORT SHAFTER, T. H., MAY 18, 1948

General Hull and Captain Russell have outlined the historical background leading up to the 1948 program of atomic weapon tests and the organization of the Task Force which was formed to carry out the program. Although the tests were conducted by a combined military and civilian team, Joint Task Force Seven is a military organization with a great majority of its personnel from the Armed Forces. However, the spirit of cooperation which existed between the military and civilian personnel resulted in the smoothest possible operation. Throughout the whole life of the Joint Task Force, there has not been a single incident which impeded any test or measurement and which arose from the rather great differences between military and civilian philosophies and methods of operation. The mixing was really very intimate; for example, most of the technical sections were staffed with both civilians and members of the Armed Forces Special Weapons Project.

A year ago, I would not have believed such a pleasant and successful working relationship could be achieved, and I believe now that it resulted in this case from the broad understanding and wisdom of General Hull. He has set a standard for all future integrated projects involving the Armed Forces and civilian groups. To have been a member of his organization has been a most pleasant experience for me personally, and I believe for all the civilians of the Task Force.

The Task Unit responsible for carrying out technical operations and making Scientific measurements was part of the Task Group commanded by Captain Russell. Captain Russell also represented the Atomic Energy Commission as Test Director. Only his wide and intimate knowledge of the organization, activities, and technical work of the Commission, and of military operations—particularly naval and air operations—made it possible for us to do the job required. Since the beginning of this project, Captain Russell and I have worked very closely together. We have even shared the same room for the past 3 months. We are now nearing the end of one of those rare experiences which someone as lucky as I sometimes finds and which marks a high light in one's life. \* \* \*

### EXHIBIT 8

(See also exhibits 2 and 11)

(Referred to on pp. 165 and 170, pt. 4, June 6, 1949)

The following answers were reported by Mr. James R. Yore, Chicago AEC Security Officer, by telephone on June 1, 1949:

1. Question. Were green stickers issued for automobiles of any persons working in Argonne Laboratories, the use of which preclude an auto check?

Answer. In February 1949 green car stickers were issued by ANL for use on Government-owned and ANL operated automobiles, and on private cars belonging to ANL employees assigned to the site in DuPage County. Cars bearing these stickers were admitted to designated parking areas within the construction areas at the DuPage site. No registration was necessary for such cars during work days between the hours of 7 a. m. to 8 p. m. It is emphasized that such cars were admitted unchallenged to the construction area, and not to any security area. Personnel in these cars who desired to enter any completed building wherein

classified material was stored or classified work was performed had to present badge identification to the guard at the entrance of each such building before they were permitted to enter. Because of the construction in progress each completed building wherein work of a classified nature was being performed or wherein classified materials were stored was designated as a security area. Each completed building on being turned over to ANL was manned by ANL guards. The general area around these buildings was a construction area. On May 31, 1949, the technical portion of this construction area was sufficiently completed to have it established as a security area and accordingly all cars entering this portion have to be registered and the personnel in the cars properly identified before entry can be gained to this area. In addition, a badge identification is made in each building located in this area. Cars bearing the ANL green stickers are still permitted entrance to the administration portion of the construction area but only to designated parking places. As was pointed out entrance to any completed building is gained only after badge identification is presented to the guard who is located at the entrance of each such building.

NOTE.—Construction area control consists of identification of cars and individual identification which was a control imposed by the contractor for property protection under his responsibility.

2. Question. Were any instructions issued either verbal or written that reports of infractions of security regulations by ANL officials were not to be reported?

Answer. No written or verbal instructions have ever been issued by any responsible authority to the effect that security infractions of ANL officials are not to be reported or written up. ANL and AEC representatives have no knowledge of any persons in any capacity purporting to issue such instructions. If it is alleged that any individual has endeavored to exercise a spurious authority in this fashion both ANL and AEC will welcome full details of the incident so that proper immediate action may be effected against a clear breach of regulations, as there are specific guard orders which require a written report by ANL guards, of all security infractions or unusual incidents.

3. Question. Was the master key file left open at ANL and the guard asked not to report the incident—if so by whom and date it occurred?

A comprehensive check at this time has failed to disclose any incident wherein a master key file or duplicate file was left open and the guard asked not to report it. There is no master key at ANL. There are several duplicate keys which are keyed to a limited number of similar files or similar doors within guarded areas. This check is continuing and further results, if any, will be reported.

4. Request. Furnish copy of all security regulations and related orders issued for or within ANL during 1948, exclusive of accountability.

Answer. Copies of all security regulations and guard orders and other security memoranda issued by ANL during 1948, as well as all security regulations issued to ANL by Chicago AEC during 1948 are being forwarded.

## EXHIBIT 9

(See also exhibits 5 and 10)

(Referred to on p. 196, pt. 5, June 8, 1949)

UNITED STATES ATOMIC ENERGY COMMISSION,  
Washington 25, D. C., June 24, 1949.

Mr. WILLIAM L. BORDEN,  
*Executive Director, Joint Committee on Atomic Energy,*  
Washington, D. C.

DEAR MR. BORDEN: There is forwarded for insertion into the record of the hearings on June 8, at page 196, materials describing the authority, responsibility, and general procedures in connection with personnel clearances as requested by the Chairman.

These materials include the following:

- (1) Bulletin GM-80, "Decentralization of Authority to Grant Personnel Clearances and of Control of Investigative Reports" (March 30, 1948).
- (2) Bulletin GM-80 (revised) 6-17-48.
- (3) Interim Procedure of 4-15-48.
- (4) Bulletin GM-85 of 5-26-48.
- (5) Bulletin GM-101 of 7-29-48.
- (6) Bulletin GM-102 of 7-29-48.

- (7) "Personnel Security Clearance Criteria for Determining Eligibility," published 1-5-49.
- (8) Letter of Director of Security, 4-20-48.
- (9) Letter of Director of Security, 5-24-48.
- (10) Announcement of Director of Security, 8-16-48.
- (11) Announcement of Director of Security, 10-1-48.
- (12) Letter from Director of Military Application Division, 11-30-48.

Sincerely yours,

CARROLL L. WILSON, *General Manager.*

Enclosures (12) as listed.

(Enclosure 1)

#### ATOMIC ENERGY COMMISSION

BULLETIN  
GM-80

SECURITY AND INTELLIGENCE  
Personnel Clearances

Issuance Date: March 30, 1948.

Revised 6-17-48.

#### *Decentralization of Authority to Grant Personnel Clearances and of Control of Investigative Reports*

Ref.: Amends General Manager's letter of February 14, 1947, subject: Personnel Clearance. Temporary security clearance for emergency appointments, clearances and approvals of aliens, and clearances and approvals for personnel of the military establishment are not covered by this Bulletin.

For: Managers of Operations.

1. *Delegation of Authority.*—a. Effective April 15, 1948, Managers of Operations are authorized to receive on behalf of the Commission reports from the Federal Bureau of Investigation concerning the character, associations, and loyalty of individuals employed by the Commission or considered for such employment, or permitted by contractors or licensees to have access to restricted data or proposed to have such access; and to determine on behalf of the Commission that employing such persons or permitting them to have access to restricted data will not endanger the common defense or security and to grant security clearance therefor, *provided*: that the complete report by the Federal Bureau of Investigation shall not have disclosed any substantially derogatory information concerning the character, associations, or loyalty of such persons. If any such substantially derogatory information shall have been disclosed, the complete FBI report, together with other pertinent information, shall be forwarded to the Office of Security and Intelligence, Washington, D. C., for determination as to whether there is security risk.

b. The authority to grant security clearance in cases where no derogatory information is disclosed may be redelegated in writing to such assistants as the Manager may deem necessary; the authority to grant security clearance in cases where derogatory information is disclosed, but is not considered to be substantially derogatory, may be redelegated in writing to Area Managers, without power of further redelegation.

2. *Allocation of Responsibility.*—a. *Managers of Operations* will designate the local Security Offices which are to assume the responsibilities and may delegate to the appropriate Area Managers or other officials authority for granting the personnel security clearances, subject to the limitations of paragraph 1 b. above and Exhibits I and II. Arrangements may be made between the respective Offices of Operations for the allocation of these responsibilities to one as an administrative service for the other, where the location of a facility is such as to justify such an arrangement as a matter of expediency.

b. *AEC Headquarters.*—The Office of Security and Intelligence will transmit to the designated local Security Offices investigative reports received from the FBI; receive and coordinate with the FBI all requests from the field relating to the procedure for processing of investigations; provide detailed information as to the subversive characteristics of organizations, upon request; and make the analysis, review and security decision on all cases requiring decision and instruction by AEC Headquarters.

3. *Procedural Guides.*—There are attached as Exhibits I, II, III and IV, the basic procedural requirements for processing personnel clearance actions under the new authority, and for furnishing statistical reports to Washington.

CARROLL L. WILSON, *General Manager.*

**Attachments:**

1. Exhibit I.
2. Exhibit II.
3. Exhibit III.
4. Exhibit IV.

*Exhibit I*

*Substantially Derogatory Information*

For purposes of Bulletin GM-80, these are the *interim* criteria which will be applied in determining whether information disclosed in investigative reports shall be regarded as substantially derogatory. Determination that there is such information in the case of an individual establishes doubt as to his eligibility for security clearance. Such cases will continue to be referred to as "hold" cases. (Cases referred to as "invite" cases are considered not to contain substantially derogatory information.)

Information shall be regarded as substantially derogatory when it reflects or implies characteristics, activities, or interests in any of the following categories, even though such information represents an allegation or is based upon hearsay reporting, or where the information may be incomplete and may require additional investigation:

- a. Possible sabotage, espionage, or attempts or preparations therefor, or association with suspected spies or saboteurs;
- b. Suspicion of treason, sedition or advocacy thereof;
- c. Advocacy of revolution or force or violence to alter the constitutional form of government of the United States, or association with individuals or organizations supporting such views;
- d. Membership in any organization which has been declared to be subversive by the Attorney General, or association with individuals who are members, or who support subversive views held by such organizations;
- e. Performing or attempting to perform duties or otherwise acting so as to serve the interests of another government in preference to the Government of the United States;
- f. Without proper authorization revealing or disclosing to any person information, documents or material involving or incorporating restricted data or other classified matter to which the individual has gained access;
- g. Evidence as to unfit character, mental instability, immoral relationships or relationships with criminal elements on the part of the individual under consideration, when there is indicated any possibility of indiscretion such as may result in disclosure of restricted data;
- h. Negligence of a grave character in the handling or protection of restricted data or other classified matter or thing, or willful disregard of security regulations;
- i. Any other information which, in the opinion of the Manager of Operations or duly authorized Area Manager, is of such a nature as to constitute a security risk.

*Exhibit II*

*Processing of Personnel Clearance Actions*

The following are basic procedural requirements for processing personnel actions:

1. *Transmittal of Requests and Reports.*—a. Existing procedures for requesting investigations remain in force pending conclusion of negotiations with the FBI concerning channels of transmittal.

b. Existing procedures for transmittal to the field of FBI reports are modified as follows:

(1) As reports are received in AEC Headquarters from the FBI, they will be immediately transmitted in duplicate to the office of origin.

(2) As completion letters are received in AEC Headquarters from the FBI, they will be transmitted to the office of origin, together with any reports filed at Headquarters prior to the effective date of this Bulletin.

2. *Personnel Security Files*.—Security folders will be filed numerically and alphabetical cross-indexes on 3 x 5 reference cards will be maintained. The practice of using "out" cards when files are withdrawn should be initiated. Security files will be completely documented with respect to all judgments, concurrences, recommendations and actions taken on the case, and as to the current employment and clearance status of the subject. Good security practice dictates that files containing FBI reports be subject to access only by AEC officials concerned. Managers of Operations may at their own discretion discuss with employers' representatives information that may assist employers in evaluating an individual's qualifications for the work required; but such discussion should be kept to the minimum consistent with effective operation and the Government's interest; should be based upon the "summary statements" prepared as indicated in Exhibit III; and in all cases the information should be treated as if classified not lower than CONFIDENTIAL.

3. *Completion of Investigation*.—Upon receipt of an FBI notice that investigation of a subject has been completed, the security file with all accumulated reports should be checked against the PSQ to verify the completeness of the investigation, and the verification will be recorded in the file. Request for missing reports, if any, will be made to the FBI through the Personnel Security Branch, AEC Headquarters.

4. *Screening and Initial Analysis—Local Office*.—Files will be read, as they are completed, and the items or paragraphs of the investigative reports referring to or containing derogatory information will be marked in red pencil along the left-hand margin. Further investigation will be requested of FBI if indicated. Detailed information as to the subversive characteristics of organizations referred to in investigative reports should be requested of the Personnel Security Branch, AEC Headquarters. Files will be separated into categories, the finding recorded on the FBI completion notice and the cases further processed as follows:

a. *Non-Derogative Information (Clear)*.—For purposes of security clearance, records of minor offenses such as traffic violations and other misdemeanors of a like nature are not considered as derogatory information. Findings will be verified and recorded, and notification of subject's clearance will be forwarded to the employer's personnel representative.

b. *Information Not Substantially Derogatory (Invite)*.—Cases will be subject of second reading by another analyst, and findings verified with reference to the interim criteria provided in Exhibit I. The decision that the information is in fact not substantially derogatory will be made by Managers of Operations and Area Managers to whom they have delegated authority to make such decisions. Notification of clearance will be reported to the employer's personnel representative with attention invited to the information furnished according to the provisions of paragraph 2 above.

c. *Substantially Derogatory Information—Character and Habits (Hold)*.—Cases will be subject of second reading by another analyst, and findings verified with reference to the interim criteria provided in Exhibit I. A Summary Statement (Exhibit III) itemizing the derogatory information will be prepared. A copy of the statement will be forwarded to the employer's personnel representative with a request for information as to the operational consequences of a possible denial of clearance, including information on the nature of the assignment involved and the qualifications of the applicant or employee. Cases will be held pending a reply from the employer's personnel representative, and closed in file or processed to Washington accordingly.

d. *Substantially Derogatory Information—Associations and Loyalty (Hold)*.—Cases will be subject of second reading by another analyst, and if verified, a summary statement will be prepared. The procedure described in c. above will be followed, except that a summary statement will not be furnished the employer's personnel representative. Instead, a statement will merely be made that there is doubt as to the applicant's or employee's eligibility for security clearance.

5. *Request for Decision on Substantially Derogatory (Hold) cases* will be made to the Personnel Security Branch, AEC Headquarters. A duplicate file will be assembled and arranged with the PSQ at the bottom; next the FBI reports in chronological order of the date reported from bottom to top; next, the summary statement; and then, in the same chronological order, copies of all memoranda and correspondence relating to the case. The transmitting memorandum will state the Manager's recommendations regarding the case with supporting reasons and, attached, the statement of pertinent comments from the employer.

6. *Revocation or Denial of Clearance.*—Specific instructions as to the interim procedure to be followed will be issued by the General Manager in each case prior to revocation or denial of clearance by AEC Headquarters.

7. *Termination or Withdrawal of Application.*—In all cases where employees are terminated from employment or access or request for clearance is withdrawn, the Security Office will advise the Personnel Security Branch, AEC Headquarters, by teletype in order that such cases may be withdrawn from processing and the files returned to the local Security Office for consolidation with the local file. Thereafter, the Security Office will obtain from the employer's personnel representative a confirming document in the case of each subject, including the nature and reason for the action taken, to complete the file.

8. *Transfers.*—When employees are under consideration for transfer, the Managers of the receiving offices will accept the AEC clearance previously granted if it is a "Q" clearance based on full FBI background investigation (MED and E clearances, and S and P approvals, will not be used as security clearance in transfers), except that approval from the Office of Security and Intelligence, AEC Headquarters, Washington, is required for all transfers to the Office of Santa Fe Directed Operations, its contractors and subsidiary sites, and for transfers to any other installations if access to production figures or weapons data is desired. In such instances, Managers of the receiving offices will request the transferring office to forward to Washington a duplicate of the security file for the individual concerned, and will advise Washington of the nature of the work upon which it is intended that the transferee will be engaged. In all other instances, security files will be transferred between local Security Offices, but Washington will be advised of the transfer.

DOE, JOHN JAMES

AEC #

OAK RIDGE

#### SUMMARY STATEMENT

Subject was engaged as a steamfitter on the MED project from January 1944 to December 1946. Administrative clearance was requested on \_\_\_\_\_ and granted on \_\_\_\_\_. A "Q" investigation was requested on \_\_\_\_\_ and completed on \_\_\_\_\_.

Investigation discloses that:

1. The Subject has been repeatedly intoxicated during 1944, 1945, and 1946 and has been arrested on many occasions during this period.

2. The Subject, according to the information obtained from responsible persons, is indiscreet in his conversations when intoxicated and has discussed in public places restricted information relative to his work.

3. The Subject, according to information obtained from reliable persons, caused a building to be burned in 1947 and was charged with arson. There was insufficient proof to convict him and the Subject was acquitted.

4. The Subject, according to a reference who has been closely associated with him for the past 15 years, is not dependable and he would not recommend him for a position of trust.

5. The Subject, according to fellow employees, has frequently reported to work in an intoxicated condition and sells bootleg whiskey on the job.

## DEFINITION OF REPORT TERMS

Column

- (2) A *Q Clearance* is a formal determination by AEC, after evaluation of a report of full background investigation by the FBI, that employing an individual or permitting him access to restricted data will not endanger the common defense or security.
- (3) An *E temporary clearance* is a determination by AEC that because of an emergency either AEC or a contractor may permit an individual to have access to restricted data prior to final clearance.
- (4) An *S temporary approval* is a determination by AEC that because of an emergency an individual may be employed by AEC prior to clearance, but that as an administrative precaution to minimize security risks, such employment shall be without access to restricted data until full clearance is obtained. Such approvals are normally given only after an FBI file and fingerprint check, and after a request has been made for Q clearance.

- (5) A *P approval*, or permit, is a determination by AEC that there is no unwarranted security risk involved in permitting a contractor employee entrance to a controlled area, provided he does not have access to restricted data.

Line where  
term first  
appears

- 1 A *Case* is set up when a request for clearance or approval is received from an employer.
- 2 An *Action* is any action following initial setting up of case which advances the case toward completion, or completes it.
- 2a A *Request* to FBI is a request to the central FBI office in Washington, D. C. for either full background investigation or file and fingerprint check.
- 2b A *Report* from FBI is the report from the central FBI Office in Washington, D. C. on which AEC takes action, normally either a completion letter or a combination file and fingerprint report.
- 3 *Closed* means closed in file through affirmation action, cancellation, or negative action.
- 3 a *Affirmative action* means granting of clearance or approval.
- 3 b A case may be *canceled* when an employee is terminated or an applicant withdraws prior to affirmative or negative action.
- 3 b (1) *Nonderogatory* means that no substantially derogatory information was disclosed.
- 3 b (2) *Derogatory* means that substantially derogatory information had been reported.
- 3 c *Negative action* means denial of clearance or denial of approval; revocation of clearance or revocation of approval; or referral to higher authority for decision.
- 3 a (1) An *Applicant* is an applicant for clearance or approval who does not already have a clearance or an approval.
- 3 a (2) An *Employee* is an individual working or entitled to work under an existing clearance or approval.

(Enclosure 2)

ATOMIC ENERGY COMMISSION

BULLETIN  
GM-80

SECURITY AND INTELLIGENCE  
Personnel Clearances

Revised: June 17, 1948.

*Decentralization of Authority to Grant Personnel Clearances and of Control of Investigative Reports*

Ref.: Amends General Manager's letter of February 14, 1947, subject: Personnel Clearance. Temporary security clearance for emergency appointments, clearances and approvals of aliens, and clearances and approvals for personnel of the military establishment are not covered by this Bulletin.

For: Managers of Operations.

1. *Delegation of Authority*.—a. Effective April 15, 1948, Managers of Operations are authorized to receive on behalf of the Commission reports from the Federal Bureau of Investigation concerning the character, associations, and loyalty of individuals employed by the Commission or considered for such employment, or permitted by contractors or licensees to have access to restricted data or proposed to have such access; and to determine on behalf of the Commission that employing such persons or permitting them to have access to restricted data will not endanger the common defense or security and to grant security clearance therefor: *Provided*, That the complete report by the Federal Bureau of Investigation shall not have disclosed any substantially derogatory information concerning the character, associations, or loyalty of such persons. If any such substantially derogatory information shall have been disclosed, the complete FBI report, together with other pertinent information, shall be for-

warded to the Office of Security and Intelligence, Washington, D. C., for determination as to whether there is security risk.

b. The authority to grant security clearance in cases where no derogatory information is disclosed may be redelegated in writing to such assistants as the Manager may deem necessary; the authority to grant security clearance in cases where derogatory information is disclosed, but is not considered to be substantially derogatory, may be redelegated in writing to Area Managers, without power of further redelegation.

c. For the purposes of this Bulletin, the Assistant General Manager will act as Manager of Operations in the Washington Area, and Washington Area Security Operations will perform the functions assigned to local Security Offices.

2. *Allocation of Responsibility.*—a. *Managers of Operations* will designate the local Security Offices which are to assume the responsibilities and may delegate to the appropriate Area Managers or other officials authority for granting the personnel security clearances, subject to the limitations of paragraph 1 b. above and Exhibits I and II. Arrangements may be made between the respective Offices of Operations for the allocation of these responsibilities to one as an administrative service for the other, where the location of a facility is such as to justify such arrangement as a matter of expediency.

b. *AEC Headquarters.*—The Office of Security and Intelligence will transmit to the designated local Security Offices investigative reports received from the FBI; receive and coordinate with the FBI all requests from the field relating to the procedure for processing of investigations; provide detailed information as to the subversive characteristics of organizations, upon request; and make the analysis, review and security decision on all cases requiring decision and instruction by AEC Headquarters.

3. *Procedural Guides.*—There are attached as Exhibits I, II, III, and IV, the basic procedural requirements for processing personnel clearance actions under the new authority, and for furnishing statistical reports to Washington.

CARBOLL L. WILSON, *General Manager.*

**Attachments:**

1. Exhibit I (*see* exhibit I, p. 949).
2. Exhibit II (*see* exhibit II, p. 949).
3. Exhibit III (*see* exhibit III, p. 351).
4. Exhibit IV (*see* exhibit IV, p. 952).

**TRANSMITTAL NOTICE**

Subparagraph c has been added to paragraph 1 on page 1 to delegate to the Assistant General Manager the same authority to grant personnel clearances for the Washington Area as is delegated to the Managers of Operations for their respective areas of jurisdiction. (*See* subparagraph c, above.)

(Enclosure 3)

**INTERIM PROCEDURE**

APRIL 15, 1948.

**Purpose**

The procedure hereinafter described is established for the purpose of assisting the Commission in discharging its duty under the Atomic Energy Act of 1946.

(a) The procedure is intended to apply to employees of the Atomic Energy Commission and to contractors' and licensees' employees subject to security clearance under the Atomic Energy Act of 1946.

(b) The pertinent sections of the Atomic Energy Act of 1946 are as follows:

SEC. 10. (a) **POLICY.**—It shall be the policy of the Commission to control the dissemination of restricted data in such a manner as to assure the common defense and security.

SEC. 10. (b) (5) (B) (i) No arrangement shall be made under Section 3, no contract shall be made or continued in effect under Section 4, and no license shall be issued under Section 4 (c) or 7, unless the person with whom such arrangement is made, the contractor or prospective contractor, or the prospective licensee agrees in writing not to permit any individual to have access to restricted data until the Federal Bureau of Investigation shall have made an investigation and report to the Commission on the character, associations, and loyalty of such individual and the Commission shall have determined

that permitting such person to have access to restricted data will not endanger the common defense or security.

(ii) Except as authorized by the Commission in case of emergency, no individual shall be employed by the Commission until the Federal Bureau of Investigation shall have made an investigation and report to the Commission on the character, associations, and loyalty of such individual.

(iii) Notwithstanding the provisions of subparagraphs (i) and (ii), during such period of time after the enactment of this Act as may be necessary to make the investigation, report, and determination required by such paragraphs,

(a) any individual who was permitted access to restricted data by the Manhattan Engineer District may be permitted access to restricted data; and

(b) the Commission may employ any individual who was employed by the Manhattan Engineer District.

#### *Notice and interim status*

(a) In those cases where the Office of the General Manager determines that a local Board hearing is appropriate because a question exists concerning eligibility of an individual for security clearance, the Manager of Directed Operations concerned, or in the case of an employee at Washington, D. C., the Assistant General Manager, will be notified of the information contained in the Security Statement and will determine the interim status of the employee with respect to security clearance. In all cases the Manager of Directed Operations shall consult with the Office of the General Manager prior to communicating to the employees his interim status.

(b) Such Manager (or in the case of Washington, the Assistant General Manager) will notify the employee of his decision as to his employment status and at the same time present to the employee the security statement which shall contain the information stated as specifically as considerations of security permit, upon which doubt arises for eligibility for security clearance.

(c) The employee will also be notified that:

1. Within a period of ten days from the receipt of such notice the employee shall file his written answer to the matter contained in the security statement with the Manager of Directed Operations from whom he receives such notice.

2. Within five days after receipt of such written answer to the security statement, the local Personnel Security Board will convene to hear such evidence as the employee wishes to submit to the Board for its consideration that pertains to the issue involved. At least 48 hours notice will be given the employee of the date and place of hearing and composition of the Board. The Chairman of the Board will notify the employee of the hour and place the Board will convene for the purpose of receiving the evidence that the employee chooses to present.

3. The employee may appear personally before such Board, be present during the entire hearing, be represented by a counsel of his own choosing, present evidence in his own behalf, through witnesses, or by documents, or both, and challenge any member of the Board for cause, which challenge or challenges will be submitted in writing to the Manager of Directed Operations concerned for his determination at least twenty-four hours prior to the date of the first meeting of the Board.

#### *Failure to file answers or appear*

The failure of the employee to file written answers shall be considered as a relinquishment by the employee of the privilege of availing himself of the benefits accorded to him under this procedure. In the event the employee fails to file written answers to the security statement within the time prescribed, final action will be taken on the basis of the existing record.

In the event that the employee fails to appear at the hearing the Board shall proceed in his absence to a determination of the issues presented.

#### *Appointment of Boards*

(a) Upon the receipt from the employee of his written answers to the security statement, the Manager shall forthwith appoint a Personnel Security Board consisting of three members, one to be designated as the Chairman.

(b) The personnel of the Boards, when practicable as determined by the Manager, shall consist of at least one member who is familiar with the general field of endeavor of that of the employee.

(c) The personnel shall be selected from a panel composed of Atomic Energy Commission employees, employees of contractors of the Atomic Energy Commission, or of such other persons as the Manager of Directed Operations determines possess the necessary qualifications for sitting as members of the Personnel Security Board. All of these persons sitting as members of Personnel Security Boards shall have a full "Q" clearance. In the case of persons who are neither employees of the Commission nor its Contractors, such persons shall be retained as consultants of the Commission for the period of their services.

(d) No person shall sit in a case as a Member of such Board who has prejudged the matter, who possesses information that would make it embarrassing to render an impartial recommendation, or who for bias or prejudice generated for any reason would be unable to render a fair and impartial recommendation.

*Conduct of proceedings*

(a) In no case will undue delay be tolerated, nor will the employee be hampered by unduly restricting the time necessary for proper preparation and presentation.

(b) The proceedings shall be presided over by the Chairman of the Board and shall be conducted in an orderly and decorous manner with every effort made to protect the interests of the Government and of the employee. In performing these duties, the Members of the Board should avoid the attitude of the prosecutor and should always bear in mind and make clear to all concerned in the proceeding that this is an inquiry.

(c) During the course of the proceedings the Chairman shall rule in open session on all questions presented to the Board for its determination, subject to the objection of any Member of the Board. In the event of an objection by any Member of the Board, a majority vote of the Board will be determinative and constitute the ruling of the Chairman. Voting may be either in open or closed session on all questions except recommendations, which shall be in closed session.

(d) In the event that it appears in the course of the hearing that restricted data may be disclosed, it shall be the duty of the Chairman to see that such disclosure is not made to persons who are not authorized to receive it.

(e) The Board will ask the employee and other witnesses any questions calculated to obtain the fullest possible disclosure of relevant and material facts.

(f) The Board will not engage in any arguments with either the employee, his witnesses, or his counsel. Nor will the Board permit any person to argue from the witness stand.

(g) The Board will admit in evidence any matters either oral or written which, in the minds of reasonable men, is of probative value to determine the issue involved. The utmost latitude will be given the subject with respect to relevancy, materiality, and competency. However, every reasonable effort will be made to obtain the best evidence reasonably available. Hearsay evidence will be admitted without regard to technical rules of admissibility and accorded such weight as the circumstances warrant.

(h) Witnesses will be permitted to testify either under oath or not under oath, and such weight will be given to this testimony as the circumstances warrant. Witnesses will be reminded of the provisions of 18 United States Code 231, which makes it a criminal offense, punishable by fine of \$2,000 and a sentence of five years in prison to knowingly and willfully make any false or fraudulent statements or representations.

(i) The employee will be afforded the opportunity of testifying in his own behalf. His failure to testify may be considered by the Board in reaching its recommendations.

(j) The Board shall endeavor to obtain all the facts that are reasonably available in order for it to arrive at its recommendations. If, prior to or during the proceeding, in the opinion of the Board the allegations in the security statement are not sufficient to cover all matters into which inquiry should be directed the Board shall suggest to the Manager of Directed Operations concerned that, in order to give fuller notice to the employee the security statement should be amended. The Manager of Directed Operations shall obtain a determination from the Office of the General Manager whether such amendment shall be made. If, in the opinion of the Board, the circumstances of such an amendment may involve an undue hardship to the employee, because of limited time to answer the new allegations in the security statement, an appropriate adjournment shall be granted upon the request of the employee.

(k) The entire proceedings shall be taken down verbatim and transcribed into a written record, a copy of which shall be furnished the employee at his request. In the event restricted data are disclosed in the transcription, such restricted data shall be deleted before furnishing the transcript to the employee.

(l) The report of the Federal Bureau of Investigation, which the Board has before it, shall not be disclosed to the employee. Because of the confidential nature of the sources of information, confrontation may not be possible.

(m) The proceedings shall not be open except to duly authorized representatives of the staff of the Atomic Energy Commission, the employee, and his counsel, and such other persons as may be authorized by the Board.

#### *Recommendations to the Board*

(a) Before making any recommendations as to the granting or denial of security clearance, the Board shall obtain the relevant data concerning the effect which denial of the security clearance would have upon the atomic energy program. Such data should not be disclosed to the employee or his representatives.

(b) The Board shall carefully consider all material before it including the report of the Federal Bureau of Investigation, the evidence presented by the employee, and the relevant data mentioned in paragraph (a) above. It shall then determine whether, in its judgment, security clearance should be granted. In making its determination the Board shall consider the manner in which the witnesses have testified before the Board, their demeanor on the witness stand, the probability or likelihood of their testimony, their credibility, the authenticity of documentary evidence, or the lack of evidence upon some material points in issue. In considering the material before the Board, the members of the Board, as practical men of affairs, should be guided by the same considerations that would guide them in making a sound decision in the administration of their own lives. If, after considering all the factors, they are of the opinion that it will not endanger the common defense and security to grant security clearance to the employee, they should so recommend. If they are unable to find that it will not endanger the common defense and security to grant security clearance, they should recommend that this clearance not be granted.

(c) The Board may also recommend further investigation upon any material matter on which the Board feels more investigation would produce beneficial results. In this event the Board will set forth in its recommendations that issue upon which more evidence is requested, identifying, when possible, the persons or sources from which evidence should be sought.

(d) The recommendation shall be determined by the majority vote. In the event of a dissent from the majority, the recommendation of the minority shall be made of record.

#### *New evidence*

(a) In the event of the discovery of new evidence that is material and relevant, by the employee who was without fault in not ascertaining its existence before, such evidence in the form of depositions will be submitted to:

(1) The Board in the event the Board has not transmitted its recommendations to the Manager of Directed Operations, or

(2) To the Manager of Directed Operations in the event the Board has transmitted its recommendations, but the Manager has not transmitted recommendations, or

(3) The General Manager in all other cases.

(b) It shall be the duty of those to whom application is properly made for the presentation of the new evidence to ascertain its materiality and relevancy and further, that the employee and his representatives are without fault in failing to present such evidence before. In the event it is determined that such new evidence should be received, those making such decision will also determine in what form it shall be received, whether by deposition, affidavit or orally.

#### *Actions on the recommendations*

(a) The recommendations of the Board and any dissent therefrom will be written out, signed by members of the Board and, together with the record of the case, shall be transmitted with the least practicable delay to the Manager of Directed Operations concerned.

(b) Upon receipt of the recommendations of the Board and the record in the case, the Manager of Directed Operations shall make his recommendations to the General Manager as to the granting or denial of security clearance, together with such other recommendations as may be appropriate. The recommendations of the Manager of Directed Operations shall be written out and, together with

the record of the case, shall be transmitted with the least practicable delay to the General Manager, or in the event that the Manager of Directed Operations recommends the denial of a security clearance he shall notify the employee in writing that an adverse recommendation has been made and is being transmitted to the General Manager and of the opportunity of the employee to request a review by the Personnel Security Review Board. This shall be done by the employee's notifying the Manager of Directed Operations in writing within five days from the receipt of such notice of adverse recommendations from the Manager of Directed Operations. Where an adverse recommendation has been made by the Manager of Directed Operations, the employee will be notified of any change in the interim status of the employee. Where the employee requests a review of the adverse recommendation the Manager of Directed Operations shall send the entire record of the proceedings along with the recommendations to the General Manager for transmittal to the personnel Security Review Board.

In any case submitted to the Personnel Security Review Board, the Review Board shall be requested to submit such recommendations to the General Manager as it considers appropriate.

(c) In any case in which he deems it advisable, the General Manager shall transmit the record to the Personnel Security Review Board and request the Review Board to review the case and make such recommendations as it deems appropriate. In the event that a case may be referred to the Personnel Security Review Board in which the Manager of Directed Operations has recommended the granting of clearance, the employee shall be notified of the submission of the case to the Personnel Security Review Board for its recommendations prior to a final determination by the General Manager.

(d) Upon receipt of the recommendations of the Manager of Directed Operations and, in the event that the case has been considered by the Personnel Security Review Board, upon receipt of the recommendations of the Board, the General Manager shall make decisions as to the granting of security clearance and take such other action in the case as he deems appropriate. The employee will be notified of the decision of the General Manager, with the least practicable delay, concerning his eligibility for security clearance.

#### *Modification of the procedure*

The foregoing procedure may be modified from time to time.

(Enclosure 4)

#### ATOMIC ENERGY COMMISSION

BULLETIN  
GM-85

SECURITY AND INTELLIGENCE  
Personnel Clearance

Issuance date: May 26, 1948.

#### *Elimination of Temporary Security Approval ("S") for Employment by the Atomic Energy Commission*

Ref.: Amends General Manager's letter of February 14, 1947, subject: "Personnel Clearance"; rescinds TWX 10-21-47 re "S" clearances, General Manager to Managers of Operations and Area Managers; amends Exhibit IV, Bulletin GM-80; amends letter 4-20-48, Director of Security and Intelligence to Managers of Operations and Area Managers, subject: "Submission of Requests for FBI Investigations and for Special Central File and Fingerprint Searches."

#### **For: Managers of Operations.**

1. Effective June 7, 1948, authority heretofore exercised by Managers of Operations and Area Managers to grant temporary security approval (Class "S") for direct employment by the Atomic Energy Commission without access to restricted data, prior to clearance, is rescinded, and the "S" classification for personnel security purposes is abolished.

2. Clearance based upon a full background investigation completed by the Federal Bureau of Investigation, in accordance with the provisions of Bulletin GM-80, or preceded by a temporary clearance under emergency conditions granted by the Director of Security and Intelligence, Washington Headquarters, will be required in the case of all direct AEC employees.

CARROLL L. WILSON, *General Manager.*

(Enclosure 5)

## ATOMIC ENERGY COMMISSION

BULLETIN  
GM-101SECURITY AND INTELLIGENCE  
Personnel Clearances

Issuance date: July 29, 1948.

*Decentralization of Authority to Grant Temporary Security Clearances Under  
Emergency Conditions*

Ref.: Amends General Manager's letter of February 14, 1947, subject: "Personnel Clearance"; amends memorandum from Director of Security and Intelligence to Managers of Operations and Area Managers dated April 20, 1948; amends memorandum of May 24, 1948, from Director of Security and Intelligence to Managers of Operations; rescinds letter of May 10, 1948, from Director of Security and Intelligence to Managers of Operations; and paragraph 2 of Bulletin GM-85.

For: Managers of Operations.

1. *Purpose.*—This Bulletin decentralizes to the Managers of Operations authority to grant emergency clearances and provides the standards and procedures which shall be followed.

2. *Delegation of Authority.*—a. The authority herein delegated shall be exercised by the Managers of Operations or, in the absence of the Managers of Operations, their deputies, and may not be redelegated.

b. Whenever it shall be found that it is indispensable to the accomplishment of the Atomic Energy Commission's duties under the Atomic Energy Act of 1946 to employ an individual directly or to authorize the granting of access to restricted data to any individual not directly employed by the Atomic Energy Commission prior to completion of an investigation and report to the Atomic Energy Commission by the Federal Bureau of Investigation on the character, associations and loyalty of such person or persons, the employment of such an individual or the granting of access to restricted data to such an individual may be authorized; provided, that the Federal Bureau of Investigation shall be requested to make an investigation and report to the Atomic Energy Commission on the character, associations and loyalty of such person or persons, and the continued employment of such person or persons, or the continued access to such person or persons to restricted data shall be conditioned upon the results of such investigation and report. In granting temporary security clearance under emergency conditions, the Manager of Operations shall make the following determinations:

(1) That an operation essential to AEC programs cannot be performed properly unless an individual be employed, or unless access to restricted data is granted to an individual who will perform the operation.

(2) That it is essential to AEC programs that such operation be performed or commenced prior to completion of such an investigation and report to the Atomic Energy Commission by the Federal Bureau of Investigation.

(3) That it is impracticable to obtain to perform such operation the services of a qualified person who has previously been cleared for access to restricted data by the Atomic Energy Commission.

(4) That available information, including any or all of the following, shall not have disclosed derogatory information: the Personnel Security Questionnaire; evaluation by responsible character references; file and fingerprint check by the Federal Bureau of Investigation; and any other data as to the character, associations or loyalty of such individual.

3. *Documentation.*—Each request made for temporary security clearance under emergency conditions must be made by a letter of request for such appointment, prepared in conformity with Exhibit I. This letter shall be accompanied by the documents containing the available information referred to in paragraph 2d (4) above, including a certification as to favorable review of the Personnel Security Questionnaire, receipt of a favorable report of Central FBI file and fingerprint search, and initiation of investigation (Exhibit II), except as provided in paragraph 4. The granting of each temporary security clearance shall be authorized in writing by the Manager of Operations in the form provided as Exhibit III.

4. *Exceptional Cases.*—Only under extraordinary circumstances shall any request for temporary clearance be processed without certification by the local security office that a favorable Central FBI file and fingerprint search has been received, and that an investigation has been initiated. Exceptions may be made, but only upon specific instruction by the Manager of Operations prior to the processing of a request, as to the documentation which will be accepted by him. In such cases, immediate steps will be taken by the local security office to initiate the investigation.

5. *Allocation of Responsibility.*—a. *Security Officer.*—Security Officers designated by the Manager of Operations will be responsible for processing, recording, reviewing, and reporting upon requests for temporary security clearance.

b. *Area Managers.*—Area Managers designated by the Manager of Operations shall review and recommend approval for requests for temporary security clearance relating to appointments under the security jurisdiction of the respective area offices.

c. *Managers of Operations.*—Managers of Operations will designate the Area Offices and operating security offices which will assume the foregoing responsibilities. Managers of Operations shall maintain a record of temporary security clearances granted by them and shall submit a report for each calendar month by the fifth day of the following month. This report shall be submitted to the Personnel Security Branch, Washington Headquarters. Data shall be separate for the Office of Operations and the Area Offices, and shall be in conformity with Form AEC-244, attached as Exhibit IV.

d. For purposes of this Bulletin, the Assistant General Manager shall act as Manager of Operations in the Washington Area.

6. *Procedural Guides.*—There are attached as Exhibits I to VII, inclusive, procedural guides for the processing and documentation of temporary security clearances under emergency conditions.

CARROLL L. WILSON, *General Manager.*

Attachments:

*Exhibit I*

(Form letter for Use in Requesting Emergency Clearances. Emergency Clearance Request Number to be inserted by Operating Security Office. Employing organization prepares original and two copies; forwards original and one copy to AEC Operating Security Office, which will retain one copy and forward original with supporting papers to the Area Manager.)

Emergency Clearance Request No. —.

To: Manager of Operations.

Thru: Area Manager.

From: (Head of employing organization; either AEC office or division, or contractor).

Subject: (Name of individual to be cleared and AEC number.)

Request is made for temporary security clearance of the above named individual for employment with access to restricted data under emergency conditions, in accordance with the provisions of the Atomic Energy Act of 1946, prior to completion of a full investigation and report to the Atomic Energy Commission on his character, associations and loyalty.

(The letter will be continued to provide information and certification as to the following:)

(a) That an operation (describe) essential to AEC programs cannot be performed properly unless an individual be employed, or unless access to "restricted data" is granted to an individual who will perform the operation.

(b) That it is essential to AEC programs that such operation be performed or commenced prior to completion of such an investigation and report to the Atomic Energy Commission by the Federal Bureau of Investigation.

(c) That it is impracticable to obtain to perform such operation the services of a qualified person who has previously been cleared for access to "restricted data" by the Atomic Energy Commission.

(d) That the required Personnel Security Questionnaire and fingerprint cards are attached.

Approved.

-----  
(Area Manager)

*Exhibit II*

(Recommendation for approval of temporary security clearance and certification as to receipt of a favorable report of central FBI file and fingerprint search, and initiation of investigation. Operating Security Office prepares original and two copies, retains one copy and forwards original and one come-back copy to Area Manager together with supporting papers. Security Office will initial the come-back copy. Area Manager returns come-back copy to Security Office and transmits original to Manager of Operations with supporting papers.)

**MEMORANDUM.**

Emergency Clearance Request No.——.

To: Manager of Operations.

From: Area Manager.

Attached is the letter requesting the above numbered temporary security clearance, together with the available information required in this case.

(The letter will be continued to provide certification as to the following:)

(a) Concurrence in the statements that emergency conditions exist which require temporary security clearance.

(b) That a favorable report of central FBI file and fingerprint search has been received and an investigation has been initiated.

(c) That the Personnel Security Questionnaire has been favorably reviewed.

(d) That approval of the request is recommended.

NOTE.—Where the request is being processed as an "exceptional case," this letter should be prepared by the Area Manager in accordance with prior agreement with the Manager of Operations. The letter shall include specific reference to the available information deemed acceptable in the case.

*Exhibit III*

(Operating Security Office prepares a letter for signature of the Manager of Operations granting temporary security clearance. Letter is prepared in original and three copies. Operating Security Office retains one copy and forwards original and two copies to the Area Manager attached with other supporting papers to Exhibit II.)

**MEMORANDUM.**

DATE-----

To: Area Manager (Attention: Operating Security Office).

From: Manager of Operations.

Subject: Emergency Clearance For—

Temporary security clearance is hereby granted to the above named individual for employment with access to restricted data under emergency conditions, in accordance with the provisions of the Atomic Energy Act of 1946, pending completion of a full investigation and report to the Atomic Energy Commission on his character, associations, and loyalty.

Access is limited to restricted data in connection with subject's duties as (describe job).

## GUIDE FOR SCREENING AND REVIEWING PERSONNEL SECURITY QUESTIONNAIRE

Carefully used, the PSQ constitutes an effective means for judging the eligibility of applicants. Area Managers should make recommendations for acceptance or rejection, and Managers of Operations should base their decisions in part on careful screening of the PSQ. The following items may be significant in reaching a decision by the Area Manager and Manager of Operations.

The Personnel Security Questionnaire shall be *screened* immediately in the operating security office in accordance with this guide. Full investigation may be recommended in the first instance to the Area Manager by the Security Office, where doubt as to eligibility for temporary security clearance is established. It should be clearly understood that even though an individual may be ineligible for temporary security clearance, this does not mean, of necessity, that clearance will be withheld when a full investigation has been completed.

1. *Incomplete Personnel Security Questionnaires.*—The Personnel Security Questionnaire shall be carefully examined for completeness. Incompleteness must usually be considered unacceptable by the screener since there is no way of determining whether the omission was careless or deliberate.

2. *Discrepancies in Personal History.*—

a. An irregular pattern of education.

(1) The data of birth should be compared with dates of education, residence, employment, and military service.

b. An irregular or incomplete pattern of residence.

(1) Location of residence and date of residence should be compared with location and dates of schooling, military service, and employment.

c. An irregular, incomplete or questionable pattern of employment.

(1) Location and dates of employment should be compared with location and dates of schooling, military service, and residence.

(2) There should be a complete and consistent accounting of the periods of time during which various occupations are claimed.

d. Discrepancy as to citizenship.

(1) The date and place of birth must be consistent with the citizenship status claimed, either by birth, derivation, or naturalization; place and dates of residence of the individual's parents.

e. Discrepancy as to military service record where applicant was within age of eligibility for military service.

(1) A service record, or record of no service should be entered.

(2) Where military service is claimed, the branch of service and the service serial number should be entered.

(3) Where no service is indicated, a satisfactory accounting for residence and employment should appear.

3. *Questionable Circumstances.*—a. Citizenship in a country other than the United States. (The approval of the Director of Security and Intelligence is required before a request for clearance may be submitted on an alien.)

b. Recent naturalization of an individual and particularly those holding prior citizenship in countries which are Communist or Fascist, or which are Communist, Fascist or otherwise subject to totalitarian domination.

c. Close relatives residing in foreign countries which are hostile to or unsympathetic with the democratic form of government.

d. Membership in organizations which are reported to be infiltrated by Communists and Fascists, or which are dominated by such individuals or their "fellow travelers".

e. Previous employment with industrial, social, civic, commercial or other bodies which are known to promote theories or beliefs opposed to the demo-

cratic form of government, or where the employer knowingly employs individuals who support such ideologies.

f. Schooling in institutions known to teach totalitarian ideologies or to endorse organizations and groups promoting ideologies and theories of government opposed to democratic principles, or serving as an instructor in such institutions.

g. Listing as references, individuals known to be of questionable character or who support beliefs and ideologies opposed to democratic principles or who are known to be members of groups opposing such principles.

h. Listing of references whose association with the applicant has been of brief duration.

i. Visits to foreign countries during recent years without supplying an adequate and satisfactory statement as to the purpose for such visits.

j. An arrest record indicating criminal tendencies or emotional or moral instability.

k. Falsification in any manner of the Personnel Security Questionnaire.

l. Any information regarded as substantially derogatory as defined in present criteria.

### *Exhibit VI*

#### PROCESSING TEMPORARY SECURITY CLEARANCE ACTIONS

The following are basic procedural requirements for processing temporary security clearances under emergency conditions.

1. *Requests based upon file and fingerprint search* shall be received by the local Security Office and processed in the following manner.

##### *a. Security Officer.*

(1) An AEC Security file will be opened and an Emergency Request Number as well as an investigation file number will be assigned. Duplicates of all documents pertaining to the request will be added to and retained in this file at all times.

(2) Unless otherwise indicated by the Area Manager, a full background investigation will be initiated immediately requesting a Q investigation in the E category.

(3) The PSQ will be screened on the basis of the guide provided as Exhibit V, and a notation shall be made on the PSQ as to favorable or unfavorable screening. The action will remain pending until the return of the results on the file and fingerprint searches.

(4) On receipt of the file and fingerprint searches the file will be forwarded to the original screener who will make a determination as to advisability of granting the request.

(a) Where favorable, a letter of certification (Exhibit II) will be prepared for the signature of the Area Manager, record copy (comeback) to be initialed by the Security Officer; and a letter of approval (Exhibit III) addressed to the Area Manager, attention the Security Office, will be prepared for the signature of the Manager of Operations. The letters and copy of the PSQ will be forwarded to the Area Manager.

(b) Where the determination is unfavorable, the original screener will prepare a rejection letter (Exhibit VII) for the signature of the Area Manager. The file (PSQ) and the letter will be forwarded to the Area Manager.

(5) Transactions will be returned (and appropriately processed and recorded) as follows:

(a) Come-back copies on all transmittals direct from the Office Area Manager; and, files attached to come-back copy of letters of rejection.

(b) Letters granting approval by the Manager of Operations together with the file of supporting papers.

(c) Unsigned letters of approval, of rejection of certification with instruction as to further processing.

(6) Where the requesting official withdraws the request for clearance subsequent to rejection of request or denial of temporary security clearance, the Security Office will notify PSB of cancellation of request for clearance by No. 2 card. Where the request for clearance is not withdrawn, no notice will be given to PSB.

**b. Area Manager.**

(1) Letters recommending approval will be forwarded with all documents attached when signed, to the Manager of Operations. Otherwise they will be returned to the Security Officer with appropriate notation as to rejection or procurement of additional information and reprocessing.

(2) Letter of rejection, when signed, will be forwarded to the requesting official, and the file returned to the Security Officer with the come-back copy of the dispatched letter. Otherwise they will be returned to the Security Officer with appropriate notation as to procurement of additional information and reprocessing.

**c. Manager of Operations.**

(1) Each transaction will be registered and controlled in accordance with reporting requirements (Exhibit IV).

(2) Letters of approval, when signed, will be returned to the Area Office together with all attached documents, except one copy of the letter of approval.

(3) Cases of denial of temporary security clearance will be returned with appropriate instruction together with all attached documents.

2. *Requests based upon PSQ review, without file and fingerprint search* shall be processed in the same manner as in paragraph 1 above except that the Security Officer will cause an immediate screening determination to be made, and process the case without awaiting report on file and fingerprint search.

3. *Requests based upon biographical data or other information under special circumstances other than as classified in paragraphs 1 and 2 above.*—Under extraordinary necessity and only by prior agreement between the Area Manager and the Manager of Operations may such special requests be processed. In all such cases, the Manager of Operations will instruct as to the documentation acceptable to him in the case. Further, the Security Officer will immediately forward and follow through a memorandum requesting the required PSQ's and fingerprinting cards, and initiate the full background investigation.

**Exhibit VII**

(Letter from Area Manager rejecting request for Temporary Security Clearance. Operating Security Office will prepare an original and two copies; retain one copy and forward original and one copy to Area Manager. Upon dispatch, record copy and file shall be returned to the Operating Security Office.)

**ATOMIC ENERGY COMMISSION**

In reply refer to:

Attention: (Office which requested emergency clearance.)

Subject: (Name.)

Reference is made to your Emergency Clearance Request No. — for the above named Subject.

A review of Subject's file as of this date makes it advisable to have a full background investigation at hand before any clearance action is taken.

Accordingly, emergency clearance on this individual will not be processed, but it should be clearly understood that this action does not mean, of necessity, that clearance will be withheld when a full investigation has been completed.

Please advise this office immediately whether the full background investigation on this request should be continued.

Very truly yours,

-----  
Area Manager

(Enclosure 6)

## ATOMIC ENERGY COMMISSION

BULLETIN  
GM-102SECURITY AND INTELLIGENCE  
Personnel Clearances

Issuance date: July 29, 1948.

*Decentralization of Authority to Reinstate Personnel Security Clearance of Former Employees*

Ref: Amends letter, Subject: "Personnel Clearance," to Heads of all Field Operations from the General Manager, dated February 14, 1947; supplements Bulletin GM-80, issued March 30, 1948, as revised June 17, 1948; and amends memorandum dated April 20, 1948, to Managers of Operations and Area Managers from the Director of Security and Intelligence, Subject: "Submission of Requests for FBI Investigations and for Special Central File and Fingerprint Searches."

For: Managers of Operations.

1. *Delegation and Redelelegation of Authority.*—a. Effective August 1, 1948, Managers of Operations are authorized to reinstate the security clearance of former employees of the Atomic Energy Commission, its contractors, and licensees, in accordance with the requirements hereinafter set forth, and are further authorized to redelegate such authority to Area Managers and Security Officers. Redelegations of authority shall be written.

b. For the purposes of this Bulletin, the Assistant General Manager will act as Manager of Operations in the Washington Area.

2. *Requirements for Reinstatement of Security Clearance.*—a. For a person who formerly held security clearance under the security jurisdiction of the office wishing to reinstate.

(1) The security clearance shall have been granted by the Atomic Energy Commission on the basis of a full background investigation.

(2) The reports of the Federal Bureau of Investigation upon the basis of which the security clearance was granted shall contain no substantially derogatory information as defined in present criteria.

(3) The reason for termination of security clearance shall not be one affecting eligibility for clearance.

(4) The termination of security clearance shall have occurred not more than twelve months prior to present application for reinstatement.

b. For a person who formerly held security clearance under the security jurisdiction of an office other than the office to which application for reinstatement is made.

(1) The office wishing to reinstate security clearance shall obtain the complete security file and a statement of the reason for termination from the office under whose security jurisdiction the applicant for reinstatement held security clearance.

(2) The office to which application has been made for reinstatement shall then review the file for compliance with the requirements of subparagraph a above.

(3) In emergency circumstances only, the office wishing to reinstate security clearance may do so prior to receipt of the records upon receipt of a certification from the Manager of the office which is to transmit the file or his duly authorized representative, setting forth the date of granting of security clearance, that there is *no derogatory information* in the records, and that the records have been reviewed and meet the requirements of subparagraph a above.

3. *Exceptions.*—a. Approval of the Personnel Security Branch, Office of Security and Intelligence, Atomic Energy Commission, Washington 25, D. C., is required for reinstatements of security clearance at the Office of Santa Fe Directed Operations, its contractors, licensees and subsidiary sites when the prior security clearance was at an office other than the Office of Santa Fe Directed Operations.

(1) The Office of Santa Fe Directed Operations shall request the office wherein prior security clearance was held to forward to the Personnel Security Branch a duplicate of the file for the individual concerned and

shall advise the Personnel Security Branch of the nature of the work upon which it is intended that the person will be engaged.

b. Approval of the Personnel Security Branch is also required for reinstatements of security clearance at any office if access to production figures or weapons data will be necessary.

(1) When such access will be necessary, the office requesting reinstatement shall forward a duplicate file of the individual to the Personnel Security Branch together with a statement as to the nature of the work upon which the person will be engaged, or shall request the office wherein prior security clearance was held to forward to the Personnel Security Branch a duplicate of the file for the individual concerned and advise the Personnel Security Branch of the nature of the work upon which it is intended that the person will be engaged.

4. *Supplemental Background Investigations.*—When the requirements set forth in paragraph 2 above cannot be met, Personnel Security Questionnaires, in quintuplicate, and a new Fingerprint Card must be obtained. The Personnel Security Questionnaires shall be completed in full. In addition to the markings normally required on the Personnel Security Questionnaires and Fingerprint Card, they both shall be marked in the upper right-hand corner with the words: "SUPPLEMENTAL INVESTIGATION."

5. *Procedure for Recording Reinstatements.*—Upon receipt of a request for reinstatement of security clearance, the responsible person shall submit to the Personnel Security Branch a Control Index Card (No. 9), Form AEC-224. Such card shall be executed in accordance with standard procedure, except that the word "REINSTATEMENT" shall be typed under the line "type clearance requested." Subsequent to reinstatement or denial of reinstatement of security clearance, the responsible person shall submit a Tickler Index Card (No. 2), Form AEC-222, to the Personnel Security Branch and such card shall have the word "REINSTATEMENT" typed under the line "type clearance requested" and the date shall be entered in the proper space. The Master Reference Card (No. 1), Form AEC-223, and the Process Index Card (No. 3), Form AEC-222b, shall be executed in accordance with standard procedure, except that the word "REINSTATEMENT" shall be typed under the line "type clearance requested."

CARROLL L. WILSON, *General Manager.*

(Enclosure 7)

#### ATOMIC ENERGY COMMISSION

##### PERSONNEL SECURITY CLEARANCE CRITERIA FOR DETERMINING ELIGIBILITY

The United States Atomic Energy Commission has adopted basic criteria for the guidance of the responsible officers of the Commission in determining eligibility for personnel security clearance. These criteria are subject to continuing review, and may be revised from time to time in order to insure the most effective application of policies designed to maintain the security of the project in a manner consistent with traditional American concepts of justice and rights of citizenship.

The Commission is revising its hearing procedure entitled "Interim Procedure" for the review of cases of denial of security clearance and for the conduct of hearings for employees desiring such review. The Interim Procedure announced April 15, 1948, places considerable responsibility on the Managers of Operations and it is to provide uniform standards for their use that the Commission has adopted the criteria described herein.

Under the Atomic Energy Act of 1946, it is the responsibility of the Atomic Energy Commission to determine whether the common defense and security will be endangered by granting security clearance to individuals either employed by the Commission or permitted access to restricted data. As an administrative precaution, the Commission also requires that at certain locations there be a local investigation, or check on individuals employed by contractors on work not involving access to restricted data (Commission authorization to be so employed is termed "security approval").

Under the act the Federal Bureau of Investigation has the responsibility for making an investigation and report to the Commission on the character, associations and loyalty of such individuals. In determining any individual's eli-

gibility for security clearance other information available to the Commission should also be considered, such as whether the individual will have direct access to restricted data, or work in proximity to exclusion areas, his past association with the atomic energy program, and the nature of the job he is expected to perform. The facts of each case must be carefully weighed and determination made in the light of all the information presented whether favorable or unfavorable. The judgment of responsible persons as to the integrity of the individuals should be considered. The decision as to security clearance is an over-all, common-sense judgment, made after consideration of all the relevant information, as to whether or not there is risk that the granting of security clearance would endanger the national defense or security. If it is determined that the common defense and national security will not be endangered, security clearance will be granted; otherwise, security clearance will be denied.

Cases must be carefully weighed in the light of all the information, and a determination must be reached which gives due recognition to the favorable as well as unfavorable information concerning the individual and which balances the cost to the program of not having his services against any possible risks involved. In making such practical determination, the mature viewpoint and responsible judgment of Commission staff members, and of the contractor concerned are available for consideration by the Manager of Operations.

To assist in making these determinations, on the basis of all the information in a particular case, there are set forth below a number of specific types of derogatory information. The list is not exhaustive, but it contains the principal types of derogatory information which indicate a security risk. It will be observed that the criteria are divided into two groups, Category (A) and Category (B).

Category (A) includes those classes of derogatory information which establish a presumption of security risk. In cases falling under this category, the Manager of Operations has the alternative of denying clearance or referring the case to the Director of Security in Washington.

Category (B) includes those classes of derogatory information where the extent of activities, the attitudes or convictions of the individual must be weighed in determining whether a presumption of risk exists. In these cases the Manager of Operations may grant or deny clearances; or he may refer such cases to the Director of Security in Washington.

Category (A). Category (A) includes those cases in which there are grounds sufficient to establish a reasonable belief that the individual or his spouse has:

1. Committed or attempted to commit, or aided or abetted another who committed or attempted to commit any act of sabotage, espionage, treason or sedition;
2. Established an association with espionage agents of a foreign nation; with individuals reliably reported as suspected of espionage; with representatives of foreign nations whose interests may be inimical to the interests of the United States. (Ordinarily this would not include chance or casual meetings; nor contacts limited to normal business or official relations.)
3. Held membership in or joined any organization which has been declared to be subversive by the Attorney General, provided the individual did not withdraw from such membership when the organization was so identified, or otherwise establish his rejection of its subversive aims; or, prior to the declaration by the Attorney General, participated in the activities of such an organization in a capacity where he should reasonably have had knowledge as to the subversive aims or purposes of the organization;
4. Publicly or privately advocated revolution by force or violence to alter the constitutional form of Government of the United States.

Category (A) also includes those cases in which there are grounds sufficient to establish a reasonable belief that the individual has:

5. Deliberately omitted significant information from or falsified a Personnel Security Questionnaire or Personal History Statement. In many cases, it may be fair to conclude that such omission or falsification was deliberate if the information omitted or misrepresented is unfavorable to the individual;
6. Violated or disregarded security regulations to a degree which would endanger the common defense or national security;
7. Been adjudged insane, been legally committed to an insane asylum, or treated for serious mental or neurological disorder, without evidence of cure;
8. Been convicted of felonies indicating habitual criminal tendencies;
9. Been or who is addicted to the use of alcohol or drugs habitually and to excess without adequate evidence of rehabilitation.

*Category (B).* Category (B) includes those cases in which there are grounds sufficient to establish a reasonable belief that with respect to the individual or his spouse there is;

1. Sympathetic interest in totalitarian, fascist, communist, or other subversive political ideologies;

2. A sympathetic association established with members of the Communist Party; or with leading members of any organization which has been declared to be subversive by the Attorney General. (Ordinarily this will not include chance or casual meetings, nor contacts limited to normal business or official relations.)

3. Identification with an organization established as a front for otherwise subversive groups or interests when the personal views of the individual are sympathetic to or coincide with subversive "lines";

4. Identification with an organization known to be infiltrated with members of subversive groups when there is also information as to other activities of the individual which establishes the probability that he may be a part of or sympathetic to the infiltrating element, or when he has personal views which are sympathetic to or coincide with subversive "lines";

5. Residence of the individual's spouse, parent(s), brother(s), sister(s), or offspring in a nation whose interests may be inimical to the interests of the United States, or in satellites or occupied areas thereof, when the personal views or activities of the individual subject of investigation are sympathetic to or coincide with subversive "lines" (to be evaluated in the light of the risk that pressure applied through such close relatives could force the individual to reveal sensitive information or perform an act of sabotage);

6. Close continuing association with individuals (friends, relatives or other associates) who have subversive interests and associations as defined in any of the foregoing types of derogatory information. A close continuing association may be deemed to exist if:

(1) Subject lives at the same premises with such individual;

(2) Subject visits such individual frequently;

(3) Subject communicates frequently with such individual by any means.

7. Association where the individuals have enjoyed a very close, continuing association such as is described above for some period of time, and then have been separated by distance; provided the circumstances indicate that a renewal of contact is probable;

Category (B) also includes those cases in which there are grounds sufficient to establish a reasonable belief that with respect to the individual there is:

8. Conscientious objection to service in the Armed Forces during time of war, when such objections cannot be clearly shown to be due to religious convictions;

9. Manifest tendencies demonstrating unreliability or inability to keep important matters confidential: willful or gross carelessness in revealing or disclosing to any unauthorized person restricted data or other classified matter pertaining either to projects of the Atomic Energy Commission or any other governmental agency; abuse of trust, dishonesty; or homosexuality.

While security clearance would ordinarily be denied in each of the foregoing categories (A), and (B), security approval, as distinguished from security clearance, might be warranted in those types of derogatory information mentioned under Category (B) above.

The categories outlined hereinabove contain the criteria which will be applied in determining whether information disclosed in investigation reports shall be regarded as substantially derogatory. Determination that there is such information in the case of an individual establishes doubt as to his eligibility for security clearance.

The criteria outlined hereinabove are intended to serve as aids to the Manager of Operations in resolving his responsibility in the determination of an individual's eligibility for security clearance. While there must necessarily be an adherence to such criteria, the Manager of Operations is not limited thereto, nor precluded in exercising his judgment that information or facts in a case under his cognizance are derogatory although at variance with, or outside the scope of the stated categories. The Manager of Operations upon whom the responsibility rests for the granting or denial of security clearance, and for recommendation in cases referred to the Director of Security, should bear in mind at all times, that his action must be consistent with the common defense and national security.

UNITED STATES ATOMIC ENERGY COMMISSION,  
CARROLL L. WILSON, *General Manager*.

(Enclosure 8)

ATOMIC ENERGY COMMISSION,  
Washington, D. C., April 20, 1948.**Memorandum.****To:** Managers of Operations and Area Managers.**From:** John Gingrich, Director of Security and Intelligence.**Subject:** Submission of Requests for FBI Investigations and for Special Central File and Fingerprint Searches.

**Ref.:** General Manager's letter of February 14, 1947, subject: "Personnel Clearance"; and Teletypes—General Manager to all Managers of Operations; October 13, 1947, eliminating "S" clearances for contractor personnel; October 13, 1947, emergency clearance for applicants for employment with contractors; October 21, 1947, emergency clearance of AEC employees; and Bulletin GM #80, subject: "Decentralization of Authority to Grant Personnel Clearances and of Control of Investigative Reports."

**Symbol:** GMSI-PS: JF.

Effective April 15, 1948, and consistent with the definitions of "clearances" and "approvals" contained in Exhibit IV of Bulletin GM-80, requests for FBI investigations and for special central file and fingerprint checks will be made in the manner hereinafter prescribed.

**"Q" Clearance.**—The letter "Q" will be stamped in the space provided for the Job Description in the lower left hand corner of page 4 of the Personnel Security Questionnaire, as well as in the upper right hand corner of page 1, on all copies. The fingerprint card will bear a similar designation. In cases where an applicant indicates former clearance under MED jurisdiction, an extra copy of the PSQ will be forwarded to Oak Ridge for search of the MED files. Oak Ridge will forward this PSQ with the MED file to Washington.

**"E" Temporary Clearance.**—Requests will be made in conformance with the form letter attached as Exhibit I. This request will be processed by the Personnel Security Branch, Office of Security and Intelligence, and upon favorable check of MED and AEC indices, the receipt of favorable file and fingerprint checks from the FBI, and initiation of background investigation, will be so certified to the Director for determination as to granting the emergency clearance. The PSQ's and fingerprint card will bear the letters "QE" stamped in the appropriate spaces on the PSQ and fingerprint card. Under conditions where an applicant indicates former clearance under MED jurisdiction, an extra copy of the PSQ will be forwarded to Oak Ridge as in the procedure outlined under "Q" CLEARANCE above.

**"S" Temporary Approval.**—It will be noted that pursuant to instruction of the General Manager transmitted by teletype of October 21, 1947, "S" Temporary Approvals for direct employment by AEC without access to restricted data may be made by the Area Manager based upon a local file check or a central file and fingerprint check. Such approvals must invariably be followed by a request for full background investigation for a "Q" Clearance. In these cases, the letter "Q" will be stamped in the appropriate spaces on the PSQ and fingerprint card, and also a notation made in the Job Description box on page 4 of the PSQ that "S" Temporary Approval has been granted.

**"P" Approval.**—Where a "P" Approval has been granted and it is desired to process a request for investigation for "Q" clearance, the PSQ and fingerprint card will be stamped with the letter "Q" in the appropriate spaces, and a notation made in the Job Description box on page 4 of the PSQ that "P" Approval has been granted.

**Special Central File and Fingerprint Checks.**—The necessity for careful planning with the FBI on the work load involved in the accomplishment of necessary investigations requires that requests for special FBI central file and fingerprint searches for purposes of "S" Temporary Approvals or "P" Approvals shall be arranged with the FBI on a work load basis through this office. Such requests must be kept to an absolute minimum, and arrangements for processing them shall be made by a letter or TWX which includes the anticipated volume monthly, the period of time during which they may be transmitted and the justification for special service; prior approval must be received from the Office of Security and Intelligence prior to such transmittals. (This requirement does not apply if such requests are being made only in occasional instances.) When such special checks have been arranged for in conjunction with initiation of a full background investigation, the letters "QS" or "QP" will be stamped in the

appropriate spaces on the PSQ and fingerprint card. In the case of request for central FBI file and fingerprint check for purposes of "P" Approval, where ultimate "Q" clearance is not desired, it is merely necessary to stamp the letter "P" in the appropriate spaces on the PSQ and fingerprint card.

**Administrative Clearance.**—It is desirable to eliminate, insofar as possible, the practice of re-employing individuals formerly cleared by MED or by AEC without further background investigation covering the intervening period. In exceptional instances where such clearance seems most expedient, request, with appropriate justification, may be addressed to the Director of Security and Intelligence, Washington, D. C., in a separate memorandum.

JOHN GINGRICH,

*Director of Security and Intelligence.*

#### *Exhibit I*

(Form letter for use in requesting Emergency Clearances)

Emergency Clearance Request No.: —.

To: Director, Office of Security and Intelligence, Atomic Energy Commission, Washington, D. C.

From: (Office of Operations or Area Office or office of the Military Establishment having security jurisdiction.)

Subject: (Name of Individual to be Cleared and AEC No.)

Request is made for temporary security clearance of the above-named individual for employment with access to restricted data under emergency conditions, in accordance with the provisions of the Atomic Energy Act, prior to completion of a full investigation and report to the Commission on his character, associations and loyalty.

(The letter will be continued to provide supporting information as to the following:)

(a) That an operation essential to the Commission's programs cannot be performed properly unless access to "restricted data" is granted to the individual employee who will perform the operation; and

(b) That it is essential to the Commission's programs that such operation be performed or commenced prior to the completion of an investigation and report to the Commission by the FBI on the character, associations or loyalty of such individual employee; and

(c) That it is impracticable to obtain to perform such operation prior to the completion of such report and investigation a qualified person who was permitted access to "restricted data" by the Manhattan Engineer District or who has previously been cleared for access to "restricted data"; and

(d) Concurrence as to the essentiality of employment of the individual recommended for emergency clearance.

(Enclosure 9)

Memorandum.

MAY 24, 1948.

To: Fletcher C. Waller, Assistant General Manager.

From: John Gingrich, Director of Security and Intelligence.

Subject: Supplement to Instructions for Processing Requests for Clearances and Notifications of Terminations of Employees.

In order to clarify many points in connection with the first stage of the decentralization program, to answer many of the questions which have been raised by the Security Officers in the field, and to stress points which apparently are not thoroughly understood by those interested, the following instructions will reiterate and supplement some of the instructions previously furnished to the field security offices as recorded in Bulletin GM-80, and the letters from the Director of Security and Intelligence addressed to the Managers of Operations and Area Managers, dated April 20, 1948, and May 26, 1948, on the subjects: "Submission for Request for FBI Investigation and for Special Central File and Fingerprint Searches," and "Emergency Clearance Requests," respectively.

#### TERMINATIONS

1. The Security Offices in the field shall not send in TWX lists on terminations.
2. The Security Offices in the field shall not send in typewritten lists on terminations.

3. (a) Where terminations are to be reported on individuals whose applications for clearance were submitted to the Personnel Security Branch in Washington prior to the institution of the decentralization program (April 15, 1948), such notification shall be made immediately following the termination by sending in a properly executed number 2 (green) index card.

(b) Where terminations are to be reported on individuals whose applications for clearance were submitted as new cases after the inauguration of the decentralization program, such notification shall be made to the Personnel Security Branch in Washington immediately following termination by sending in a properly executed number 3 (yellow) card when the FBI investigation has been completed, or a number 2 (green) card when the FBI investigation is incomplete.

4. When an individual for whom clearance is pending is terminated from one job and is rehired within one week following such termination under a security approval and "Q" clearance is desired for the new employment, the notice of rehire shall be forwarded to the Personnel Security Branch immediately by TWX, advising that the FBI investigation should not be discontinued. Even in such cases, the TWX will not serve as a record in the Personnel Security Branch, but in addition to the TWX, the field must send in a properly executed number 2 (green) index card to record the termination, and a properly executed number 9 (pink) index card to notify the Personnel Security Branch of the rehire.

*Requests for "Q" Clearance Investigations Made Following Lapse of Time After "P" Approval is Granted*

1. When a "Q" investigation is requested for clearance of an individual who has some time previously received a "P" approval as a result of a central file and fingerprint check, new Personnel Security Questionnaires must be submitted to request "Q" clearance and must show that the individual is employed under "P" approval, and they must be accompanied by either a new fingerprint card, or a T-1 (Negative FBI Identification Check Form) or a T-2 (FBI Arrest Record Form). By submitting the T-1 or T-2 forms, the field security officer may thus avoid having to obtain a new fingerprint card from the applicant for clearance. The statement that the individual is employed under "P" approval should be placed in the job description box on page 4 of all copies of the PSQ.

*Transfers From One Employer to Another Under the Security Control of the Same Area Office*

1. When an individual transfers from one employer to another under the security control of the same Area Office, it is not necessary to notify the Personnel Security Branch, except in cases where it is anticipated that the individual will be transferred to work involving production figures or weapons data. Such transfers shall not be made without approval of the Director of Security and Intelligence, Washington, D. C.

*Preparation of Letters of Transmittal Requesting Clearance*

1. In preparing letters of transmittal on requests for clearance, it is very necessary that the symbol of the office, followed by the transmittal letter number, be placed at the top of the transmittal letter.

2. The names of all individuals for whom clearance is requested must appear in the letter of transmittal.

3. The classification of the type clearance desired must be listed in the transmittal letter.

*Preparation of Emergency Clearance Supporting Letters*

1. The emergency clearance supporting letters must follow in detail the instructions as set forth in the letter from the Director of Security and Intelligence addressed to the Managers of Operations, dated May 26, 1948, on the subject: "Emergency Clearance Requests."

2. In preparing such supporting letters for emergency clearances, the AEC file number shall follow the name of the individual for whom emergency clearance is being requested.

*Notification to the Personnel Security Branch of New Action on Cases Carrying an Old AEC File Number*

1. If the Personnel Security Branch is being notified of an action involving a case where the request for clearance was made prior to the inauguration of the decentralization program, the old file number (the one given the case by the Personnel Security Branch) shall be used where it is known. In such cases a new file number should not be assigned by the field Security Office.

2. Where the old AEC file number is known to the field, it shall be placed in the AEC space on the appropriate index card being sent in to record the action. The identifying letter symbol of the office of origin shall be placed under the AEC number space.

3. Where the old AEC file number is not known at the field Security Office, the identifying letter symbol of the office of origin shall be placed on the appropriate index card under the AEC file number space to report a termination or transfer. Additional identifying data such as the birth date of the individual, his social security number, his Army serial number, etc., shall be placed on the index card under the space where the AEC file number would normally be put. Upon receipt of such data from the field, the Personnel Security Branch will research the file and advise the field of the file number.

*Preparation of Personnel Security Questionnaires in Requests for All Types of Security Clearance Investigations*

1. The full name of the individual for whom clearance is requested shall be entered in the name box (number 1) on the Personnel Security Questionnaire, with the last name first, followed by the given name and the middle name or initial, if any.

2. The full name shall be followed by the AEC file number in the name box (number 1) on the Personnel Security Questionnaire.

3. The classification of the type clearance desired shall be typed on all copies of the PSQ following the name and AEC file number in the name box (number 1) on the Personnel Security Questionnaire.

4. The classification of the type clearance being requested shall be stamped prominently in the upper right hand corner of the *first page of the first copy* of the Personnel Security Questionnaire in requests for all types of security clearances. Because the classification of the clearance is typed in the name box on all copies of the PSQ, this eliminates the necessity of stamping the classification in the right-hand corner of *all* copies of the PSQ, as required in the letter of April 20, 1948.

5. *With respect to requests for emergency clearances, it is emphasized that if the "QE" designation does not appear in the proper place in the name box on the PSQ, no special file and fingerprint search will be conducted by FBI and emergency clearance cannot, therefore, be granted.*

6. When the individual for whom clearance is requested is employed, the information regarding his employment together with a statement as to the type clearance (MED, or Temporary Emergency) or approval under which he is employed, shall be placed in the job description box under the description of the job to which he is to be assigned.

*Preparation of Fingerprint Cards to Support Requests for Clearances*

1. The AEC file number assigned shall be placed in the number space in the upper left hand corner of the fingerprint card.

2. The AEC file number shall be followed by the designation of the classification of type clearance being requested.

3. The classification of the type clearance being requested must also be stamped in the upper right-hand corner of the fingerprint card.

*Preparation of the Jacket in Which PSQ's Are Forwarded to the Personnel Security Branch*

1. The data listed on the outside of the jacket in which PSQ's and fingerprints are forwarded to the Personnel Security Branch shall include the full name (last name, followed by given name, middle name or initial, if any), the AEC file number, and the classification of the type clearance being requested.

2. In placing the Personnel Security Questionnaires and fingerprint card in the envelope, the copy of the Personnel Security Questionnaire stamped with the classification of the type clearance being requested, shall be on the top of the other copies of the Personnel Security Questionnaires.

JOHN GINGRICH,  
*Director of Security and Intelligence.*

(Enclosure 10)

ATOMIC ENERGY COMMISSION,  
Washington 25, D. C., August 16, 1948.

ANNOUNCEMENT

*The Processing of "QE" and "QP" Investigations for Submission to FBI*

Ref.: This announcement supplements instructions contained in letter from the Director of Security and Intelligence to Managers of Operations and Area Managers dated April 20, 1948, Subject: Submission of Request for FBI Investigations and for Special Central File and Fingerprint Searches; and supplement thereto dated May 24, 1948.

For: Managers of Operations and Area Managers.

Effective immediately, where a full background investigation is requested in conjunction with a class "E" temporary clearance or a class "P" security approval, in which special cases central FBI file and fingerprint searches are required, it will be necessary to forward an individual letter of request attached to the PSQ.

The PSQ to which the attachment is made will be the most legible copy and the one which is stamped in the right-hand upper corner with the designations either "QE" or "QP". The letter should be stapled to the third page within the fold of the PSQ. A suggested form of letter of request is attached hereto.

This office has been advised that the use of this procedure will expedite the return of central file checks.

JOHN GINGRICH,  
*Director of Security and Intelligence.*

Attachment.

-----  
Operations or Area Office  
-----  
Type of Clearance or Approval

HON. JOHN EDGAR HOOVER,  
*Director, Federal Bureau of Investigation,  
U. S. Department of Justice,  
Washington, D. C.*  
(Attention: Mr. Victor P. Keay.)

DEAR MR. HOOVER:

----- is the subject of an Atomic Energy  
Name AEC No.

Act investigation prior to employment within the Program. You are requested to have a file search made on the subject and to furnish the results on or with this letter.

Very truly yours,

\_\_\_\_\_  
*Chief of Security, U. S. Atomic Energy Commission,  
-----, Office of Operations.*

(Enclosure 11)

ATOMIC ENERGY COMMISSION,  
Washington 25, D. C., October 1, 1948.

ANNOUNCEMENT

*Transmittal of Clearance Requests to the Federal Bureau of Investigation*

Ref.: Amends paragraph 9. a. of the letter of the General Manager, dated February 14, 1947, entitled: "Personnel Clearances," and Exhibit 2, paragraph 1. a. of Bulletin GM-80; and amends memorandum of the Director of Security and Intelligence to the Managers of Directed Operations and Area Managers, dated April 20, 1948, Subject: "Submission of Requests for FBI Investigation and for Special Central File and Fingerprint Searches"; and amends the letter from the Director of Security and Intelligence to the Managers of Directed Operations and Area Managers, dated May 24, 1948, Subject: "Supplement

to Instructions for Processing Requests for Clearances and Notifications of Terminations of Employees."  
For: Managers of Operations.

*Effective October 10, 1948*, the following basic procedural requirements for transmittal of requests for clearance investigation will be followed by the Offices of Operations, and the Area Offices designated by Managers of Operations.

*Address.*—The local AEC Security Offices will forward requests for full background investigation and file and fingerprint searches directly to:

Honorable J. Edgar Hoover, Director,  
Federal Bureau of Investigation,  
U. S. Department of Justice,  
Washington, 25, D. C.  
Attention: Chief, Atomic Energy Liaison Section.

#### *Personnel Security Questionnaire*

*Form.*—Official AEC form Budget Bureau #38-R001.1 must be used.

*Original and Copies.*—An original signed copy will be retained by the local Security Office and four copies will be forwarded to the Federal Bureau of Investigation. Additional copies may be required from the personnel representative dependent upon local practice and the nature of the requests, e. g., an additional copy will be required for "QE" requests. No more than thirty (30) days should elapse between the execution and submission of a PSQ in any case.

*Section Number One.*—Enter last name, first name, and middle name or initial. The name must be followed by the AEC security file number and the type clearance requested.

*Type Clearance.*—The type clearance shall also be stamped prominently in the upper right-hand corner of the first page of the first copy forwarded to the Federal Bureau of Investigation.

*Job Description Section.*—This section will contain a description of the job requiring the full background investigation. If the subject is employed at the time the request is made, the type clearance (MED, or temporary emergency) or approval granted for such employment will be stated therein.

*Employment and Access.*—The agency or firm to employ applicant must be stated and the nature of access, whether to restricted data or to an exclusion area, must be shown on page 4 of all copies forwarded to the FBI.

#### *The Fingerprint Card*

*Form.*—The required form is identified as GPO No. 0-16-22517. Where a T-1 (Negative FBI Identification Check Form) or a T-2 (FBI Arrest Record Form) on the individual is available, it may be forwarded in place of the fingerprint card.

*Name and Signature of Applicant.*—The name must be entered in name box in upper left-hand corner. Enter last name, first name and middle name or initial. The signature of the applicant on the reverse side must match this name.

*Physical Impairment.*—Where physical impairment makes it impossible to make an impression on the fingerprint card, such impairment should be satisfactorily explained on the card.

*The AEC File Number.*—The AEC file number assigned shall be placed in the number space in the upper left-hand corner of the fingerprint card.

*The Type Clearance.*—The AEC file number on the fingerprint card shall be followed by the designation of type clearance being requested. It must also be stamped in the upper right-hand corner of the fingerprint card above, but not in, the space provided for insertion of the fingerprint classification by the FBI.

*Retakes.*—Where the fingerprint card being forwarded is the result of a request for retake of the fingerprints, such card must be stamped on the side where the fingerprints are recorded with the word "RETAKE."

*Other Data.*—The Signature of the official taking the prints, and the date the impressions are taken, must be inserted in the proper spaces. The reverse side of the card must be completed in full detail. A photograph is not required.

*AEC File Number is Permanent.*—File numbers are assigned consecutively by the local Security Office where the request for an investigation originated subsequent to April 15, 1948, and are prefixed by code letters assigned by Personnel Security Branch. File numbers assigned by PSB prior to April 15, 1948, will continue in use in each case and a new number shall not be assigned; but in each such case the local code symbol shall be entered after or under the number. In cases of transfer, or reinstatement of clearance the original AEC file number will continue in use.

*The Transmittal Jacket.*—The Personnel Security Questionnaires together with the fingerprint card for each request must be forwarded by the AEC

Security Office in a transmittal jacket. The data listed on the outside of the jacket shall include the full name, the AEC file number and the type of clearance being requested. In placing the Personnel Security Questionnaires and fingerprint card in the jacket, the copy of the PSQ stamped with the classification of the type clearance being requested shall be on the top of the other copies of the PSQ.

**Transmittal Letter.**—The jackets containing four copies of the PSQ and the fingerprint card shall be accompanied by a letter of transmittal addressed to the FBI as indicated above. This letter shall be on Atomic Energy Commission letterhead and shall clearly indicate the office of origin of the request, and shall contain the letter symbol of the office together with a transmittal letter number, placed at the top of the letter. An alphabetized list of names of individuals and AEC numbers for whom clearance is requested must appear in the letter of transmittal. The type clearance desired must be stated and one letter of transmittal should be restricted to requests for one type of clearance.

**Special Letters Required in "QE" and "QP" Investigations.**—When a central FBI file and fingerprint check is requested prior to completion of a full background investigation, an additional letter shall be enclosed, and it should be stapled to the third page within the fold of the stamped copy of the PSQ. This letter shall indicate the originating Operations or Area Office and the type clearance or approval in the upper-right-hand corner. It should be addressed to Honorable J. Edgar Hoover, Director, Federal Bureau of Investigation, U. S. Department of Justice, Washington 25, D. C., Attention: Chief, Atomic Energy Liaison Section.

The letter should state that the individual is the subject of an Atomic Energy Act investigation prior to employment within the program, and should request that a file search be made on the individual and the results be furnished on or with the letter. This letter should be signed by the Chief of Security of the office making the request. The letter may be mimeographed with signature reproduced.

**Procedure for Transmittal to the Field of FBI Reports.**—Reports will be received in AEC Headquarters from the FBI; will be immediately recorded and transmittal in duplicate to the office of origin.

**Index Cards.**—When Personnel Security Questionnaires and fingerprint cards are submitted to the FBI, the standard index card shall be prepared, and the number 9 Control Index Card must be transmitted directly to the Personnel Security Branch by the local AEC Security Office instead of stapling it to the jacket which goes to the FBI. All other index cards will be handled in accordance with existing procedure.

**Missing Reports or Additional Investigation Requests.**—Missing reports or additional investigation requests will be transmitted to the Personnel Security Branch for forwarding to the Federal Bureau of Investigation. They shall not be sent directly to the FBI by the Offices of Operations or Area Offices. Requests for such additional investigation must be accompanied by a copy of the PSQ and copies of all investigative reports in the case to which such requests relate. Upon receipt from the FBI of the missing reports, or reports containing additional investigation, they will be transmitted to the requesting office by the Personnel Security Branch.

#### TRANSFERS AND REINSTATEMENTS

Pending revision of personnel security clearance procedure, the following changes in existing procedure regarding transfers and reinstatements will become effective December 1, 1948.

#### *Transfers Between Installations or Areas not Under the Security Control of the Same Office of Operations*

When an employee is under consideration for transfer, the Manager of Operations to whose security control he is being transferred will accept the AEC clear-

ance previously granted if it is a "Q" clearance based on a full FBI background investigation (MED and emergency clearances will not be used as security clearance in transfers). The Manager of the office to which the employee is being transferred may in his discretion after review of the files, accept an "S" clearance when it is based on a full FBI background investigation in lieu of "Q" clearance, and is authorized to change the "S" clearance to "Q" clearance in accepting such transfer. In all such transfers the security files will be transferred between the local security offices, and the Personnel Security Branch in Washington will be informed of action taken, including any change in type clearance, by the forwarding of the appropriate index card to Washington.

***Transfers from One Employer to Another When Both Are Under the Security Control of the Same Office of Operations and/or Area Office***

The Manager of Operations or Area Manager of the installation to which the individual is being transferred will accept the AEC clearance previously granted if it is a "Q" clearance based on a full FBI background investigation (MED and emergency clearances will not be used as security clearance in transfers). The Manager of the office to which the employee is being transferred may in his discretion after review of the file accept an "S" clearance when it is based on a full FBI background investigation in lieu of "Q" clearance, and is authorized to change the "S" clearance to "Q" clearance in accepting such transfer. The Personnel Security Branch in Washington shall be notified of a change in type clearance by the forwarding of the appropriate index card to Washington.

***Reinstatements***

The procedure outlined in Section 3 entitled "Exceptions" to Bulletin GM-102, "Decentralization of Authority to Reinstate Personnel Security Clearance of Former Employees," will no longer be followed.

[Unclassified]

**DEVELOPMENT AND OPERATION OF THE ATOMIC ENERGY COMMISSION PERSONNEL SECURITY PROGRAM**

1. With the adoption of the Atomic Energy Act of 1946 in August of that year, certain personnel of the Manhattan Engineer District were selected to assist in the development and organization of the Atomic Energy Commission. Although the Atomic Energy Commission formally assumed responsibility for the administration of the Atomic Energy Project on January 1, 1947, the policies and procedures which had been established by the Manhattan Engineer District were continued in full force and effect pending the adoption of the Commission's own policies and procedures.

2. With respect to security, all of the policies and procedures as established in the Manhattan Engineer District Security Manual, dated November 26, 1945, were continued until February 17, 1947, the effective date of the General Manager's letter dated February 14, 1947, Subject: "Personnel Security." All other Security regulations and practices affecting physical security, document and information control, and the handling of security violations, theretofore in effect under the Manhattan Engineer District, continued in full force and effect.

**PERSONNEL SECURITY OPERATION IN THE MANHATTAN ENGINEER DISTRICT**

3. The following is a brief outline of the policies and procedures of the Manhattan District as they affected personnel security clearances as reconstructed from the memories of several employees of the Commission who were formerly employed in the Personnel Security Organization of the Manhattan District.

a. The Manhattan Engineer District maintained a Project Security Office in Washington, D. C., and a Central Operating Office at Oak Ridge, with sub-offices or area offices, as they were called, at several other places throughout the United States. Each area office had an Area Security Officer who was directly responsible to the Chief of Intelligence and Security at Oak Ridge. However, the

Area Security Officer was fully responsible for the security clearance of all employees under the jurisdiction of his particular area.

b. Contractors processed all applicants for employment, securing from each applicant Personnel Security Questionnaires, Fingerprint Charts and Security Acknowledgments, which were forwarded to the Local Area Security Office. The Area Security Office transmitted all fingerprint charts directly to the Federal Bureau of Investigation for central fingerprint file check. The Personnel Security Questionnaires were then reviewed and divided into categories consistent with the classification of the duties to be performed by the applicant. These categories were:

Category I: Those having access to top secret or secret information.

Category II: Those having access to classified information lower than secret.

Category III: Those working in unclassified positions.

c. The Area Security Office prepared "data cards" in each case, forwarding one of these to the Oak Ridge Central Office. With respect to personnel falling into Category I, special investigations were requested from the Army Area in whose jurisdiction the installation was located. In those cases falling into Category II, routine investigations were requested either from the applicable area or from commercial investigative agencies. With respect to those persons falling within Category III, Central FBI fingerprint checks and local agency checks only were required.

d. The Area Security Offices reviewed the personnel papers and reports of investigation, and if it was determined that a more complete investigation should be conducted, a special Army investigation was requested or the case was referred to the Counter Intelligence Group associated with the Area Security Office for such additional investigation. In all such cases, notification of the action was made to the Oak Ridge Central Office.

e. Upon receipt of the reports of investigation, the local Area Security Office reviewed the files and cleared those persons whose investigation reports were evaluated as not containing sufficient derogatory information to raise a question concerning eligibility for security clearance.

f. In those cases where the reported derogatory information was of a criminal nature, the Area Security Office disposed of the cases administratively. In those cases where the reported derogatory information was of a loyalty nature and where the local Area Security Office was unable to effect a determination, or an administrative disposition, or where the individual's value to the Project was involved, they were referred to the Chief of the Security and Intelligence Division, Oak Ridge.

g. Loyalty cases received by the Office of the Chief of Security and Intelligence at Oak Ridge were reviewed by an Analysis and Review Section which made recommendations to the Chief regarding ultimate disposition. Depending upon the circumstances of the case, security clearance might be denied by the Chief of the Security and Intelligence Division or by succeeding higher commands.

h. In no known case was security clearance denied publicly or with notice to the individual concerned. Denials were handled by terminating employment for administrative reasons, or by arranging transfers of the individuals to less sensitive work. In at least one case, arrangements were made to have the individual called to active duty with the Army. Many cases were cleared as "calculated risks" with continuing investigation and surveillance. No administrative review was afforded the personnel affected, although in a few cases numbering not more than twenty, the individuals were called in for an interview.

i. Available records indicate that approximately 390,000 personnel clearance cases were processed by the Manhattan Engineer District. There were approximately 96 denials of clearance in cases where the reported information was of a loyalty nature, and an additional 217 terminations were arranged administratively after derogatory information of a loyalty nature was developed. As previously stated, cases in which the derogatory information was of a criminal nature, such as arson, narcotic users and peddlers, homosexuals, etc., were disposed of administratively by the Area Security Officer, usually through working arrangements with the contractors.

j. All transfers of personnel to Los Alamos were passed upon by the Project Intelligence Office in Washington. All other transfers of personnel having access to classified information were processed by the Project Intelligence Office, Washington, or by the Central Office, Oak Ridge.

k. All requests to reinstate personnel who had access to classified information at different installations were passed either by the Project Intelligence Office, Washington, or by the Central Office, Oak Ridge.

l. Reinstatements at the same Area were processed in the same manner as applicants. If after review of the individual's file a doubt existed as to the desirability of granting clearance, additional investigation was requested or other appropriate action taken.

m. The Central Headquarters at Oak Ridge provided primarily a central data card record and an Analysis and Review Section for the processing of questionable cases, transfers, and reinstatements. The Manhattan District Security Manual of November 26, 1945, is contained in Security Source Book No. 1, as Section A.

PERSONNEL SECURITY OPERATIONS UNDER THE AUTHORITY OF GENERAL MANAGER'S LETTER, FEBRUARY 14, 1947—SUBJECT, PERSONNEL CLEARANCE

4. On February 14, 1947, the General Manager of the Atomic Energy Commission released a letter establishing the policy and procedures with respect to personnel security clearance. These procedures became effective on February 17, 1947, and specifically superseded Section II of the Manhattan District Security Manual referred to above, and all other prior instructions with respect to the security clearance of personnel. All other security regulations and practices theretofore in force under the Manhattan Engineer District were to continue in full force and effect until specifically modified by the Commission. (See Security Source Book No. 1, Section B for General Manager's letter dated February 14, 1947, subject: "Personnel Clearances" with Amendments, Revisions, and Additions Thereto.)

5. Prior to January 1, 1947, and during the period between that date and February 17, 1947, approximately 400 individuals were processed to the Federal Bureau of Investigation for full background investigation in accordance with special arrangements made with that Bureau. This figure included former Manhattan District personnel and applicants for employment on Atomic Energy Projects.

6. Following the General Manager's letter of February 14, 1947, the volume of requests for full background investigations increased almost immediately to approximately 2,000 cases per month, building up steadily during the next several months until in July 1947 a maximum of 8,080 cases were processed to the Federal Bureau of Investigation. This volume for background investigations was maintained for several months before beginning to decrease. It was obvious from the very beginning of the Commission's administration of the Atomic Energy Project that there would be a very large number of Manhattan District personnel carried over for employment, either as direct employees of the Commission, or its contractors, and that all such personnel would be subject to full background investigation by the Federal Bureau of Investigation. Inasmuch as these individuals had been previously cleared for access to classified material by the Manhattan District they were transferred to the Atomic Energy Project under this clearance in accordance with the appropriate provisions of the Atomic Energy Act, and their employment continued pending full background investigation, and a determination of their eligibility for Atomic Energy Commission security clearance.

7. This investigative burden involving 26,879 individuals imposed difficulties on the Federal Bureau of Investigation in promptly handling investigation requests. In order to meet this difficulty an agreement was reached between the Commission and the Federal Bureau of Investigation whereby the Federal Bureau of Investigation was to investigate as promptly as possible all new applicants for employment on atomic energy projects, and to defer the investigation of old employees who had Manhattan District clearance. This meant that during the peak months the Federal Bureau of Investigation would handle a varying volume of reinvestigation cases equal to the difference between 8,000 cases (the maximum which the Federal Bureau of Investigation could handle) and the number of applicant cases submitted during any given month. The Bureau did, however, agree to perform full background investigations on a number of employees who had Manhattan District clearance, but in which certain information with derogatory implications had been developed. These cases were selected by the Commission and were given priority treatment by the Federal Bureau of Investigation.

8. Coincident with the release of the General Manager's letter of February 14, 1947, an Acting Director of Security was appointed, and a Personnel Security Section organized. Under the Chief of the Personnel Security Section there were placed four analysts, and a number of other personnel to process all requests for security clearance. The functions performed by the Personnel Security Section under the general supervision of the Acting Director of Security were as follows:

a. To receive all Personnel Security Questionnaires from Field Operating Security Offices; to assign case numbers, prepare Summary Sheets, case folders, index cards, follow-up of delayed investigations, the recording of cancellations and terminations, and the submission to the Federal Bureau of Investigation of retakes of fingerprint charts, etc.

b. Upon completion of the background investigation and receipt of the case reports the case folder was referred to one of the analysts who would review the file for completeness of the investigation and content thereof.

c. Each case in which no derogatory information was found was evaluated accordingly, and the analyst indicated his independent judgment of such evaluation in the case file. Thereafter, with the authorization of the Acting Director of Security, the case was returned to processing personnel who recorded the clearance grant, and notified the Field Security Office thereof. In cases where the files were found to contain derogatory information by the analyst, the case was subjected to a reading by a second analyst, and where both analysts agreed that the case file did, in fact, contain derogatory information, but of a non-substantial nature, clearance was authorized with advice to the Field Operating Offices inviting attention to the reported information. This practice gave rise to the designation "invite" cases.

d. In the event of a disagreement between the two analysts as to the evaluation to be given a case, the matter was referred to the Chief of the Personnel Security Section who, with the authorization of the Acting Director of Security when he determined that the reported information was not, in fact, substantial, authorized the granting of clearance on an "invite" basis.

e. In those cases where the analysts determined that the reported information was of a substantially derogatory nature, determination of eligibility for security clearance was withheld to permit either additional investigation by the Federal Bureau of Investigation or a review by the General Manager, and in some few cases by the Commission. This withholding of security determinations pending extension of the record and determination of eligibility for security clearance gave rise to the designation "hold" cases. Before submission of any case to the General Manager, the Chief of the Personnel Security Section would discuss the hold case with the analysts, following which discussion a summary of information would be prepared, and forwarded to the Acting Director of Security for his transmittal to the General Manager and the Commission. After review of the case the General Manager might take one of the following actions:

- (1) Authorize the granting of clearance on an "invite" basis.
- (2) Authorize the denial of security clearance.
- (3) Cancellation of consideration for employment where the individual was an applicant for employment with the Atomic Energy Project.
- (4) Refer the case to the Commission for review and concurrence or disagreement with the recommendation for denial of clearance.
- (5) Appoint an "ad hoc" Board to consider the case and make recommendations to the General Manager regarding a final security determination (This practice was initiated in May 1947.)

f. After a final security determination had been made by the General Manager, the file was returned to the Acting Director of Security for the recording of security actions and notification thereof to the Operating Security Offices. In their consideration of several cases, the "ad hoc" Boards found it advisable in a few cases to invite the subject seeking security clearance to appear before the Board, and give his explanation of the information with derogatory implications. This practice later was reduced to a regular procedure in the treatment of certain security clearance cases, and is referred to later in this paper as the Informal Interview Procedure. As the processing of personnel clearances increased in volume, it became evident that many of the cases, particularly those of former Manhattan District personnel, presented difficult problems in making a final security determination. These difficulties arose not only because of the derogatory information which had been developed by the Federal Bureau of Investigation but, also, because of the fact that many of these individuals were performing work of considerable importance to the Atomic Energy

Program. It was felt that because of the association and experience of the individual with the Project, a determination to deny security clearance might result in serious operational consequences and additional security hazards. It was, therefore found advisable to defer security determination in some cases of this type until such time as the Commission could establish some type of administrative review procedure. In the meantime, the individual was continued in employment under his Manhattan District clearance.

#### ESTABLISHMENT OF THE ATOMIC ENERGY COMMISSION PERSONNEL SECURITY REVIEW BOARD

9. In a memorandum dated July 20, 1947, the General Counsel recommended that the Commission authorize the General Manager to establish and appoint a Personnel Security Review Board. The stated functions of this Board would include participation in adjudication of questions regarding personnel security clearance of applicants, employees of the Atomic Energy Commission and its contractors, and in the development of policies, procedures and standards for adjudicating personnel security problems. This recommendation was adopted by the Commission on July 21, 1947. However, the implementation of the recommendation was delayed pending further review by the General Manager of the proposed program and its implications. On November 19, 1947, the Commission requested that the Board, which had been previously sanctioned, be selected and appointed as quickly as possible. Thereafter, the Commission selected a Chairman who, in consultation with the Commission, appointed the other members of the Atomic Energy Commission's Personnel Security Review Board. The Chairman of this Board was the Honorable Owen Roberts, former Justice of the United States Supreme Court.

10. On November 28, 1947, the Joint Congressional Committee on Atomic Energy had expressed an interest in the cases of twenty-one employees of the Commission or its contractors, and these were the first cases presented to the Board, which held its first meeting on February 21, 1948. The summaries of the administrative handling of these cases, and fourteen others which were reviewed by the Atomic Energy Commission Personnel Security Review Board under Mr. Justice Roberts, are set forth in Section C of Security Source Book No. 1.

#### ESTABLISHMENT OF THE ATOMIC ENERGY COMMISSION INTERIM PROCEDURE FOR ADMINISTRATIVE REVIEW

11. Throughout the period January 1, 1947, to April 15, 1948, consideration had been given to the adoption of an administrative review procedure which would be effective not only in safeguarding the security of the Atomic Energy Program but would also assure fair and just treatment of the employees affected. On April 15, 1948, the Commission issued an Interim Procedure for Administrative Review which provided employees, whose security clearance had been questioned, an opportunity to present their cases to a local Personnel Security Board, which would thereafter make recommendations as to the security determination to be made. This Interim Procedure provided for the following:

- a. Notification of employee of basis for question concerning eligibility for clearance.
- b. The opportunity to answer in writing and to be afforded a hearing.
- c. Representation by counsel of his own choosing, and the presentation of evidence in his behalf in person and through witnesses.
- d. Recommendation to be made to Manager of Operations by local Board as to whether security clearance should be granted or denied.
- e. After review of complete case record, the Manager of Operations was to make a recommendation to the General Manager as to granting or denial of clearance.
- f. If the Manager of Operations recommended that clearance be denied, the employee was to be notified and given the opportunity to request that the Atomic Energy Commission Personnel Security Review Board review the adverse recommendation. The General Manager also could submit a case to this Board on his own initiative, with notice to the employee.
- g. On the basis of its review, the Atomic Energy Commission Personnel Security Review Board was to make a recommendation to the General Manager to assist him in his final determination as to security clearance. (The "Interim Procedure" is contained as Section D of Security Source Book No. 1.)

12. Coincident with the release of the Commission's Interim Procedure for Administrative Review, the General Manager's Bulletin GM-80, Subject: "Decentralization of Authority to Grant Personnel Clearances and of Control of Investigative Reports," was issued. This decentralization, implemented by the GM Bulletin, had been the subject of much discussion prior to April 15, 1948, and was designed as a first step in the decentralization of personnel security operations to the Commission's Offices of Operations. In addition to the delegation of authority to Managers of Operations, this bulletin established interim criteria for evaluating reported derogatory information. (Bulletin GM-80 is contained as Section E in Security Source Book No. 1.)

13. During the period January 1, 1947, to April 15, 1948, the Commission's Personnel Security Branch processed the cases of 71,762 individuals. After analysis and review, the clearance of 1,693 individuals (including 269 applicants) was "withheld" pending further study and development of review procedures. Final action on these cases resulted in the granting of clearance to 531 individuals (37 of these were permitted to continue employment without access to restricted data or exclusion areas), and in the cases of the remaining 1,073 individuals, requests for clearance were withdrawn or the individuals were terminated by the Offices of Operations either by resignation, administrative dismissal or transfer to work not requiring access, and in the cases of applicants by a determination "not to hire." This final group of 1,073 cases were disposed of without security determination by the Director of Security.

PERSONNEL CLEARANCE OPERATIONS UNDER AUTHORITY OF GENERAL MANAGER'S  
BULLETIN GM-80

14. With the release of Bulletin GM-80 referred to above, the processing, analysis and review of all personnel security cases which had theretofore been performed by the Personnel Security Branch, Washington Headquarters, became the responsibility of the Offices of Operations. It authorized the Managers of Operations to grant security clearance in cases evaluated as not containing substantially derogatory information. Authority to deny or revoke security clearance was specifically reserved to the General Manager. This Bulletin provided for the processing of personnel security cases as follows:

a. Under the general supervision of a Director of Security for the Office of Operations, the Personnel Security Section of the Office of Operations received Personnel Security Questionnaires from the contractors or the Atomic Energy Commission's Personnel Office for processing directly to the Federal Bureau of Investigation. Upon receipt of the Personnel Security Questionnaires, the Personnel Security Section would assign case numbers, prepare case folders, summary sheets, index cards, ticker follow-up of delayed cases, and provide an index card for the Central Index which was to continue to be maintained in the Personnel Office of the Director of Security, Washington Headquarters.

b. Upon completion of the FBI investigation and the receipt of reports in the Offices of Operation, the case file was referred to a screener whose function it is to verify the completeness of the investigation, and to appropriately mark all derogatory information contained in the investigative reports. In those cases in which the screener finds no derogatory information, his findings are verified and recorded and notification of clearance is forwarded to the employer's Personnel Representative. (Records of minor offenses are not considered as derogatory information.)

c. In cases where the screener has made a finding that there is derogatory information, but not of a substantial nature ("invite" cases), the file is subject to a second reading by an analyst, and the findings of the screener are verified with reference to the Commission's criteria for determining eligibility for security clearance. Where the analyst verifies that the information is not, in fact, substantially derogatory, he transmits the case to the Area Manager or to the Manager of Operations for his concurrence that the information is in fact not substantially derogatory. Where the Area Manager or the Manager of Operations concurs in the findings of the analyst, his concurrence is noted in the file which is then forwarded for processing of the clearance grant and notification to the employer's Personnel Representative.

d. In cases where both screener and analyst have evaluated the reported information as being substantially derogatory, with reference to the Commission's criteria ("Hold" cases), the analyst prepares a summary statement, itemizing the derogatory information, and forwards same, together with the com-

plete file, to the Area Manager or Manager of Operations. If the Area Manager or Manager of Operations concurs in the findings of the analyst, a letter is prepared and forwarded to the employer's Personnel Representative, advising him that the determination of the Subject's eligibility for security clearance is being "withheld" pending advice from the employer's Personnel Representative as to the operational consequences of a possible denial of security clearance. The case is then returned to the analyst who, upon receipt of the employer's report, either closes the case (where advice is received that employee has terminated), or, he transmits the file to the Chief of Security for forwarding same to the Director of Security, Washington Headquarters, with comments and recommendations.

e. Upon receipt of cases containing information with substantially derogatory implications ("Hold" cases) in the Office of the Director of Security, Washington Headquarters, the complete file is carefully reviewed, resulting in one or more of the following actions:

(1) In the case of applicants, the Director of Security may deny security clearance on the existing record, or grant security clearance on an "invite" basis if he determines that the reported information is not, in fact, substantially derogatory with reference to the Commission's published criteria, or, he may make a determination that additional investigation, and in some cases an informal interview, is necessary before making a determination to deny or grant security clearance.

(2) In the cases of employees, the Director of Security may make a determination that the reported information is not, in fact, substantially derogatory with reference to the Commission's published criteria, in which event the Manager of Operations is advised that he may grant security clearance on an "invite" basis, or

(3) He may make a determination that further investigation should be requested of the Federal Bureau of Investigation, which may result in a final determination that security clearance may be granted on an "invite" basis, or

(4) That the record in the case should be further extended and clarified through informal interview with the Subject by appropriate Atomic Energy Commission Officials designated by the Manager of Operations, in which cases a stenographic transcript is made and becomes a part of Subject's security file, or

(5) He may instruct the Manager of Operations concerned to initiate a Local Personnel Security Board hearing under the Interim Procedure for Administrative Review.

f. In those cases where an informal interview has been authorized, and after review of the transcript of the interview and related information in the file, the Manager of Operations may be authorized to grant security clearance; or, he may request additional investigation by the Federal Bureau of Investigation through Washington Headquarters of the Division of Security to verify information obtained in the informal interview; or, he may make a determination that the doubt concerning Subject's eligibility for security clearance has not been resolved by the informal interview and the additional investigation; in which event, the Manager of Operations will request the Director of Security, Washington Headquarters, to initiate administrative review of the case under the Interim Procedure.

g. In those cases where the Administrative Review Procedure is invoked, the Security Division, Washington Headquarters, prior to its initiation, reviews the complete record in the case, prepares a summary statement and a security statement which will be incorporated in a letter of notification to the employee. The security statement is then forwarded to the Manager of Operations with an appropriate letter instructing him to appoint a Local Personnel Security Board who will process the case in accordance with the Commission's Interim Procedure and make recommendations to the Manager of Operations as to whether security clearance should be granted or denied.

h. In those cases where the Local Personnel Security Board recommends that security clearance be granted and the Manager of Operations concurs in that recommendation, a transcript of the Local Personnel Security Board's hearing will be transmitted to the General Manager, via the Director of Security, Washington Headquarters, for his decision as to the granting of security clearance, or

i. Where the Local Personnel Security Board recommends denial of clearance and the Manager of Operations concurs in that recommendation, the employee

is notified by the Manager of Operations that he is recommending to the General Manager that clearance be denied. The Manager of Operations also informs the employee in writing of his right to have his case reviewed by the Atomic Energy Commission's Personnel Security Review Board in Washington. If the employee does not respond to this notification within five days, the Manager of Operations' recommendation to deny clearance becomes final and the case is closed. Where the employee requests a review of the recommendation for denial of clearance, the Manager of Operations forwards the case to the General Manager, via the Director of Security, Washington Headquarters, for transmittal to the Atomic Energy Commission's Personnel Security Review Board.

j. Where the Manager of Operations does not concur in the recommendation of the Local Personnel Security Board and his recommendation is contrary to it, the procedures outlined in subparagraphs h and i above are operative.

k. When a case is referred by the General Manager to the Atomic Energy Commission's Personnel Security Review Board following the recommendation of denial of clearance by a Manager of Operations, the Review Board considers the entire record in the case and makes its recommendation to the General Manager who will make a final determination, either to grant or deny clearance.

#### INFORMAL INTERVIEW PROCEDURE

15. Reference has been made in previous paragraphs to the "Informal Interview Procedure." In May 1947 when the first "ad hoc" board was convened to consider personnel security cases, it was found that in certain cases the reported information with derogatory implications could be clarified and explained by informal interview with the Subject of the investigation. Accordingly, this procedure was resorted to in a few cases prior to April 15, 1948, and more frequently thereafter.

16. After analysis and review, informal interviews were authorized in those cases where:

a. There was reason to believe that the derogatory implications of reported information might be offset not merely by a self-serving statement, but by extenuating information which might be subject to verification, and which might eliminate the doubt concerning eligibility.

b. It was determined that further information might be elicited which would warrant further inquiry by the Federal Bureau of Investigation.

17. The Director of Security, in authorizing Managers of Operations to conduct informal interviews, has outlined not only the procedure to be used in the conduct of the interview but, also, the appropriate action which might be taken after the interview has been completed and reviewed. These actions might consist of any one or more of the following:

a. The granting of security clearance if the Manager of Operations determined that the common defense and security would not be endangered thereby.

b. A request for additional investigation by the Federal Bureau of Investigation through the Director of Security, Washington, D. C.

c. A recommendation to the Director of Security, Washington, D. C., that the case should be the subject of formal hearing by a Local Personnel Security Board.

18. During the period January 1, 1947, to April 30, 1948, informal interviews had been authorized in the cases of 161 individuals (including 15 applicants), and 147 had been completed. As a result of the informal interviews, followed in many cases by additional investigation, 116 individuals were granted security clearance, 4 individuals were denied clearance (2 were permitted to continue in employment without access), 27 terminated prior to interview or final determination, and 14 were in a pending status.

#### LOCAL PERSONNEL SECURITY BOARD CASES

19. During the period April 15, 1948, to April 30, 1949, the cases of 53 individuals had been referred to Managers of Operations for formal hearings before Local Personnel Security Boards. In 14 cases, the individuals concerned resigned or were terminated prior to the Board's hearings. In two cases, the hearings are pending, and in 37 cases, Board hearings have been completed with the following results:

a. Clearance granted—19.

b. Clearance denied—4.

c. Clearance denied, but decision appealed to Atomic Energy Commission Personnel Security Review Board—7 (5 of these cases are pending with the Review Board at this time. The other two have been finally determined and are included in a. and b. above.)

d. Pending decisions of Managers of Operations—5.

e. Pending decision of Director of Security—4.

(For summaries of the administrative handling of these cases, see Section C of Security Source Book No. 1.)

20. At the time of the release of Bulletin GM-80, it was anticipated that further decentralization of authority to Managers of Operations for personnel clearance matters would follow. It was intended that eventually Managers of Operations would be empowered to not only grant security clearances, but, also, to deny or revoke clearance under definite procedures to be established. Such further delegation of authority to Managers of Operations has been deferred by the Commission to permit:

a. An evaluation of the results of the decentralization of Personnel Security Operations made under Bulletin GM-80.

b. To permit preparation and publication of more detailed "uniform standards" or "criteria" for determining eligibility for security clearance.

c. To provide the Commission time to study revisions of the Interim Procedure for Administrative Review; and

d. To permit the Commission to make a determination as to the advisability of extending some type of administrative review to applicants.

#### TEMPORARY SECURITY CLEARANCES UNDER EMERGENCY CONDITIONS

21. It became apparent early in the Commission's administration of the Atomic Energy Program that certain personnel of the Commission and its contractors would have to be employed before a full background investigation and report by the Federal Bureau of Investigation could be obtained. Accordingly, the General Manager was authorized by the Commission to grant emergency clearances as indicated in Section F of Security Source Book No. 1. The General Manager was also given permission to redelegate the authority to grant emergency clearances to the Director of Security. On July 29, 1948, the Commission, by Bulletin GM-101, redelegated this authority to grant emergency clearances to the Managers of Operations.

22. Monthly summaries of emergency clearances granted during the period from January 1, 1947, to April 30, 1949, are contained as Section G of Security Source Book No. 1. The full background investigation of individuals who had been granted emergency clearances developed substantially derogatory information in only a very small number of cases.

#### STATISTICAL DATA

23. In the period from April 15, 1948, the date of the first phase of decentralization, to April 30, 1949, the security divisions in the Operating Offices processed the cases of 69,707 individuals to the Federal Bureau of Investigation for background investigations. After analysis and review of the investigation reports, clearance determination was "withheld" in the cases of 384 individuals (including 86 applicants), and their files were referred to the Director of Security, Washington Headquarters for decision as to the procedure to be followed in determining their eligibility for security clearance. Final action in these cases resulted in the granting of clearance to 157 individuals, denial of clearance in the cases of 84 persons (34 of these were permitted to continue employment without access to restricted data or exclusion areas). Fifty-four cases are pending action in the Operations Offices, and in the cases of the remaining 89 individuals, requests for clearance were withdrawn or the individuals were terminated either by resignation, transfer to work not requiring access to restricted data, or by determination "not to hire" in cases of applicants.

24. During the total period covered by this paper (January 1, 1947, to April 30, 1949), the Commission had processed the cases of 141,469 individuals to the Federal Bureau of Investigation for background investigations. Records in the office of the Director of Security reflect that clearance was withheld in 2,077 cases. Of these cases, clearance was ultimately granted to 688 individuals, and denied to 173. In 1,162 cases, terminations occurred prior to final security determination. Fifty-four of the cases, as of April 30, 1949, were pending final security clearance determination.

## EXHIBIT 11

(Referred to on p. 197, pt. 5, June 8, 1949)

JUNE 6, 1949.

HONORABLE BRIEN MCMAHON,

*Chairman, Joint Committee on Atomic Energy,  
Senate Office Building, Washington 25, D. C.*

DEAR SENATOR MCMAHON: In answer to Senator Knowland's specific questions raised in the hearings this morning, we should like to report the following:

1. Attached herewith is a rough sketch and a scaled map of the area, which is divided into the East Area (temporary facilities) and the West Area (so-called permanent facilities).

a. *East Area.*—This area is guarded by Argonne National Laboratory guards. It is fenced with chain link fencing. It is divided by an interior fence into 2 areas:

(1) *The Administration and/or Construction Area.*—Access to this general area is controlled for administrative reasons, such as prevention of theft of government property. The Administration Building and other buildings within the area are separately guarded, and special identification is required for access to them.

(2) *The Technical Area.*—Access to the Technical Area is controlled by a guard at this point of entrance through the interior fence; at which health-safety controls are also exercised. Interior buildings within the Technical Area which contain restricted data are separately guarded. Special identification is required for access to such buildings.

It should be emphasized that the order of May 10, 1949, discussed in the hearing this morning, had no application in the East Area, over which the Austin Company exercised no jurisdiction or control.

b. *West Area.*—This area is guarded by Austin Company guards; and is the area to which the guard order of May 10, 1949 (enclosure 1) applied.

This area is not fenced, as construction is not far enough along to require same. Access to the general area is controlled at guarded checking stations on access roads for administrative reasons.

The purpose of the order of May 10, 1949 (enclosure 1) was specifically for the purpose of protection of Government and Company property. Registration of those entering the Area out of hours is for the purpose of identifying individuals having a legitimate reason for being in the Area and who are charged with responsibility that any persons accompanying them will not pilfer Government or Company property. The order was issued by the Chief of Plant Production of the Austin Company who has no connection with nor jurisdiction over the East Area.

There is only one quonset building within this area in which restricted data is located. This building is separately guarded twenty-four hours a day, and restricted data is further protected by 3-combination lock file cabinets. Guard orders for this post are set forth in Enclosure 2.

Only approved personnel are issued badges for access to this Area. The order of May 10, 1949, is in the nature of a general order governing the conduct of guards exercising supervision over the Area. Special orders applying to particular guard posts such as the entrance to the aforementioned quonset hut were issued to meet the problem existing at this particular locality.

Sincerely yours,

CARROLL L. WILSON, *General Manager.*

Enc. 1 Memo to All Guards 5/10/49.

Enc. 2 Memo re Guards' Duties during Working Hours, Non-Working Hours.

The official duties of the above persons are such that their presence is required on the project at irregular and unanticipated times. Said persons will be fully responsible for any and all persons accompanying them.

The only registration required will be that of the persons listed above. This registration will be at the point of contact and will include the number of persons in the party.

The above procedure will be required only after normal working hours and on Saturdays, Sundays and Holidays.

*This listing is to be carried on each guard's person at all times when on duty at this site.*

J. A. PINES, *Chief, Plant Protection.*

JAP: bas.

(Enclosure 2)

Guards' duties during working hours.

1. Check all employees' badges and identification.
2. If a visitor, check same for possession of a visitor's badge.
3. Assist in directing the visitor to his or her destination. Guard holds the visitor until the person he or she is to see comes out and identifies the visitor.
4. Each morning promptly route the visitors' report for the previous day to guard headquarters.

5. Perform all routine relief duties for receptionists.

Guards' duties during nonworking hours.

1. Guard assigned to this post will be held directly accountable for all security violations during his full tour of duty. He is to maintain the front door of building locked at all times.

2. Register on an ANL Form #9 (relative to registration of employees after work) full name, badge number, time in and time out of all persons entering or leaving the Administration Building (*no exception*).

3. He is to maintain a constant fire watch throughout the building.
4. (Deals with duties in case of fire.)
5. All cartons, waste paper baskets and receptacles of all kinds that are used or may be used which porters, janitors or maintenance men may handle to remove scrap paper or other refuse, are to be checked before permission is granted to remove same from premises. Maintain, at all times, a strict inspection of all boxes, bags, packages, thermos bottles and all other places of concealment that may be employed to remove company or government property by stealth.
  - a. When warranted, through suspicion, advanced information, or in any case where a person or persons are suspected of removing or attempting to remove government property concealed on their person, hold such person or suspected person at your post and immediately contact the Lt. or Sgt. of the shift.
  - b. While waiting for the Lt. or Sgt. in charge to arrive, search suspected person or persons for any articles he may have on his person that could be used as evidence against him.
6. The guard is responsible for security against theft, destruction or damage.
- 7 & 8. (Deal with checking and recording temperatures, etc.)
9. Submit written report on ANL Form #3, "Unusual Incident Report" at close of shift to Captain of Guard or Lt. in charge, covering any unusual incident that may have occurred during the tour of duty.

---

## EXHIBIT 12

(See also Exhibits 13 and 14)

(Referred to on p. 239, pt. 6, June 9, 1949)

### RADIOISOTOPES FOR INTERNATIONAL DISTRIBUTION

CATALOG AND PRICE LIST, SEPTEMBER 1949

(Isotopes Branch United States Atomic Energy Commission, P. O. Box E,  
Oak Ridge, Tennessee)

#### INTRODUCTION

As officially announced by President Truman, September 3, 1947, at the Fourth International Congress of Cancer Research, St. Louis, Missouri, the U. S. Atomic Energy Commission is now in a position to accept requests for radioisotopes from foreign countries.

Radioisotope production processes have improved sufficiently in the first year of domestic distribution to permit supplying reasonable demands from outside the United States. Especially is this true for those isotopes of particular value in biological and medical investigations.

Radioisotopes are producible in the uranium chain-reacting pile by two processes: (1) the fission of U-235 nuclei and (2) neutron absorption by nonfissionable nuclei. Radiomaterials listed in this catalog, with the exception of Iodine 131, are produced by the latter process. "Fission Products," obtained from process (1) above are not in routine production and therefore have not been included in this catalog.

#### NEUTRON-INDUCED RADIOISOTOPES

Neutron-induced radioisotopes producible in the pile are formed by (1) simple neutron absorption, ( $n, \gamma$ ) reaction, yielding a radioactive isotope of the parent element, (2) transmutation, ( $p$ ) or ( $n, \alpha$ ) reactions, yielding radioisotopes which differ chemically from their parents, and (3) ( $n, \gamma$ ) reaction followed by a decay chain, yielding radioactive daughters nonisotopic with the target element.

Production of neutron-induced radioisotopes involves the insertion of an element, in a suitable elemental or compounded form, into the pile and its subsequent removal. Materials to be activated are placed in small aluminum containers. The containers are then inserted into holes in a graphite block or "stringer," which composes part of the graphite and uranium structure of the pile. The block, loaded with containers, is pushed into the interior of the pile through an opening in the surrounding thick concrete shield and is irradiated for a period varying from a few days to several months.

Isotopes produced by the above neutron-induced reactions are available in chemically unprocessed irradiated units. Some are also available in a form chemically separated from the target material. Each of these forms is more fully explained below.

#### IRRADIATED UNITS

Unprocessed irradiated materials are shipped in the aluminum cans as they are removed from the pile, except for packing in containers which stop harmful radiation. In this case no chemical separation process on the active material is done prior to shipping. The term "Irradiated Unit" is used to describe such an activation. (See pages 8-9\* and pages following.)

When the target element is irradiated as a compound, the other elements in the compound are chosen so as to produce: (1) no radioisotopes, (2) short-lived radioisotopes, or (3) radioisotopes easily separated from those produced by the target element. Oxides of metallic elements, for example, make suitable target compounds since oxygen is not activated. In some cases an irradiated unit of a compound may contain several radioisotopes, which are all useful and easily separable.

Target materials are chemically and spectroscopically analyzed and are chosen for their high purity. Since minor or trace quantities of chemical contaminants will nevertheless be present, extremely small quantities of radiocontamination will be produced in most units. For the majority of uses the radiocontaminants due to impurities will be insignificant.

Production time required for irradiated units will vary from two weeks to six weeks. Generally a higher priced unit takes a longer time to produce.

#### SEPARATED RADIOISOTOPES

A transmutation reaction yields a radioisotope which differs chemically from the target material. When a radioisotope of an element is produced by transmutation, it will not be diluted with "carrier" (stable isotopes of that element) other than that which is already present as an impurity in the target material.

A separation of the desired active species is usually made before use.

Several of the radioisotopes, which are very useful in biological and medical application and hence in constant demand, are chemically separated routinely and an effort is made to keep stocks on hand for shipments. Separated Carbon 14, Phosphorus 32, Sulfur 35 and Calcium 45 are available in this group. The specifications for these materials are given on pages 6 and 7.\*

The same consideration of chemical separability holds for the daughters of neutron-induced decay chains—Iodine 131 from tellurium bombardment is an example.

*No guarantees of radiochemical or chemical purity or other such characteristic may be made*, although every effort will be made to produce as high quality material as possible. Analyses will be furnished with each shipment.

Separated radioisotopes are sold by millicuries as defined on page 5.\*

Carbon 14, because of its long half-life, is kept in stock and deliveries can be made promptly. Other separated materials (I 131, P 32, S 35 and Ca 45) are processed in batches and shipment can usually be made from Oak Ridge each week.

#### PUBLICATIONS

For the use of its staff and maintenance of reference files, the Isotopes Branch should be supplied with three copies of a report, within six months after completion of research, stating the results of investigations carried on with isotopes obtained through its facilities. The user should publish the results in an appropriate technical or scientific journal or permit the U. S. Atomic Energy Commission to arrange for such publication.

#### CLINTON LABORATORIES

The pile at Clinton Laboratories, Oak Ridge, is the major producer of radioisotopes for off-Commission distribution. Research and development on production and separation processes at the facility have markedly increased the availability of the useful radioisotopes. Actual sale and distribution of radiomaterial is made by Clinton Laboratories (which acts as the "supplier" under a contract with the U. S. Government). Requests for allocation must first be submitted and approved by the Isotopes Branch of the Commission.

\* Page numbers refer to original document.

Argonne National Laboratories (Chicago, Illinois) and the University of California Radiation Laboratory (Berkeley, California) have also carried on extensive research in the production of isotopes and in radiochemistry. Credit for initial research in these fields must be shared by many laboratories and individuals, both within the United States and abroad.

#### PROCUREMENT

Production of a radioelement or preparation of material for shipment is scheduled only after a purchase order has been received. Before placing a purchase order it is necessary to file a request with the Isotopes Branch, U. S. Atomic Energy Commission, and to receive an approved allocation authorizing the procurement.

Details of the procedure for requesting and purchasing radioactive materials are included in this catalog (pages 14-16 \*). Further information may be obtained by writing to the U. S. Atomic Energy Commission, Oak Ridge, Tennessee, attention: Isotopes Branch.

Each foreign government is requested to designate some representative (or agent) in the United States to handle matters connected with procurement of radioisotopes. This agent may be a diplomatic official, a commercial concern, or any other individual or corporation selected by the foreign government. This representative would maintain liaison with the U. S. Atomic Energy Commission in all matters pertaining to allocation, purchase orders, payments for isotopes and containers, transportation arrangements and charges.

All correspondence should be in English. This will avoid misinterpretation of technical information, especially data relating to health and safety precautions.

The technical staff of the Isotopes Branch, U. S. Atomic Energy Commission, will be pleased to assist in providing references on techniques in the use of materials.

General conditions of eligibility for foreign users will be similar to those for users in the United States.

**ANY REFERENCE TO MATERIALS IN THIS CATALOG SHOULD INCLUDE THE CATALOG ITEM NUMBER**

#### TRANSPORTATION AND CUSTOMS CLEARANCE

Shipping charges must be paid by the requester. Clinton Laboratories will package materials for shipment and deliver them to the carrier, for consignment to any point within the United States. Payment for all charges, customs clearance, and transportation outside continental United States will be the responsibility of the authorized agent of the foreign government.

NOTE.—OUTLINE OF PROCEDURE FOR HANDLING FOREIGN REQUESTS—SEE PAGE 14 \*.

#### HOW TO ESTIMATE COSTS

1. Number of units <sup>1</sup> desired	_____	\$
2. Price per unit	_____	
3. Total (1 x 2)	_____	
4. Handling charges <sup>2</sup>	_____	
5. Cost of material (3 + 4)	_____	
6. Deposit on shipping container <sup>3</sup>	_____	
7. Total amount of remittance (5 + 6)	_____	

<sup>1</sup> MILLICURIES for processed materials and IRRADIATED UNITS for unprocessed materials. A millicurie is defined for the purpose of this catalog as  $3.7 \times 10^7$  disintegrations per second. For cases in which there is an indeterminate mixture of isotopes, absolute measurements of activity cannot be given. In such cases the "millicurie" means  $3.7 \times 10^7$  beta emissions per second in the sample. For a definition of "irradiated unit" see pages 8 and 9.\*

<sup>2</sup> A handling charge of \$25 is made for each shipment (each item constitutes a shipment). On approved continuing orders for isotopes with half-lives of less than 30 days the handling charge for the first shipment will be \$25 and \$10 for each subsequent shipment.

<sup>3</sup> A deposit of \$125 will be required on returnable containers used to ship gamma ray emitters. A refund will be made upon return of container, express prepaid, in good condition, within fourteen (14) days from date of receipt of shipment. Such containers must not be used for any other product than that shipped therein. Charges for damaged parts will be made as follows:

Container	_____	\$85.00
Shipping crate	_____	20.00
Tools	_____	20.00
Total	_____	125.00

\* Page numbers refer to original catalog.

Shipments are made f. o. b. Clinton Laboratories, Oak Ridge, Tennessee, USA. Transportation costs including return of container will be paid by requester.

\* \* \* \* \*

#### OUTLINE OF PROCEDURE FOR HANDLING FOREIGN REQUESTS

1. All correspondence with the Commission should be in English. It is believed that this will save time, and will avoid misinterpretation of technical information, particularly information relating to health and safety precautions. Correspondence should be addressed to the Isotopes Branch, United States Atomic Energy Commission, P. O. Box E, Oak Ridge, Tennessee.

2. The radioisotopes for which foreign distribution is being authorized are listed and described in the foregoing pages of this catalog. Additional copies of the catalog may be obtained from the Isotopes Branch at Oak Ridge. Subject to limitations on availability of supplies, the radioisotopes listed in the catalog will be furnished for eligible uses abroad—namely, for scientific research, medical research and therapy, including such uses on animals as may be related to medical research and therapy.

3. Each foreign government interested in having radioisotope shipments made to eligible users in its country is requested to address a note to the Secretary of State, referring to this memorandum, and stating:

a. The name of a representative (or agent) in the United States who will handle matters connected with radioisotope shipments. (Such representative may be a diplomatic official, a commercial concern, or any other person or corporation selected by the foreign government. The representative should be authorized to maintain liaison with the United States Atomic Energy Commission, and to complete financial and shipping arrangements, such as payments for materials, deposits for shipping containers, arrangements for transportation, etc.)

b. That the representative is authorized to certify on behalf of the government to the accuracy of the information set forth in each request for radioisotopes.

c. That the foreign government understands that there are special health and safety hazards arising out of the possession, handling or use of radioisotopes, and that such hazards require special protective measures.

d. That the foreign government agrees that neither the United States Government nor any United States distributing agent shall be responsible for injury or damage caused by, or in the application of, any radioisotopes delivered.

4. Following the deposit of such a note with the Department of State, individual requests for radioisotopes should be submitted to the United States Atomic Energy Commission by or through the representative designated by the foreign government pursuant to paragraph 3 above. (A new note need not be presented to the Department of State unless the authorized representative shall have changed, or unless there should be some material change in the information supplied in the original registration.) The request may be on a form such as the one inclosed herewith, or by letter, and should be addressed to the Isotopes Branch, United States Atomic Energy Commission, P. O. Box E, Oak Ridge, Tennessee. The request may be accompanied by a purchase order made out to the Commission's designated contractor (e. g., the Clinton Laboratories, Oak Ridge, Tennessee). It is not essential, however, that a purchase order be submitted until the Commission has issued a "notice of allocation" (see paragraph 8 below). The request should include adequate information on the following matters:

a. Name and item number of radioisotope desired (as listed in the catalog).

b. Quantity desired. (Radioisotopes with half-lives of less than 30 days may be allocated, on one request, in amounts sufficient for six months' needs. Shipments may be made at intervals of not less than one week as arranged with the supplier.)

c. Desired time and rate of deliveries.

d. Names and experience of persons who will use materials furnished.

e. Name of institution at which materials will be used.

f. Purposes for which materials will be used.

g. Health and safety measures to be employed.

5. The request also should contain the following undertakings:

a. That, (1) at intervals of six months after delivery of each shipment of radioisotopes to the representative of a foreign government for forwarding to an investigator in the country he represents, three copies of a progress report on the results of the investigation will be furnished to the United States Atomic Energy Commission and (2) the results of such investigation if publishable by

nature either will be published by the author in an appropriate technical or scientific publication or permission to arrange for publishing such results will be granted to the Commission.

b. That the materials will not be used in a manner other than as disclosed in the request.

c. That qualified scientists irrespective of nationality will be permitted to visit the institutions where the materials will be used and to obtain information freely with respect to the purposes, methods and results of such use, in accordance with well-established scientific tradition.

6. Requests which the United States Atomic Energy Commission may receive directly from institutions or doctors in foreign countries ordinarily will be referred to the representative designated pursuant to paragraph 3 above, for handling and consideration in accordance with established procedures.

7. Particularly in view of the limited supply of radioisotopes and the special health and safety hazards connected therewith, it is hoped that each interested foreign government will establish adequate procedures for reviewing the merits of a request prior to its submission to the United States Atomic Energy Commission. In this connection, it may be helpful to explain the procedure which is followed in the United States.

In its program of domestic distribution of radioisotopes, the Commission has established criteria for determining which requests should be granted. In all cases, the domestic applicant is required to provide sufficient information on the matters listed in paragraph 4 above, to permit review and evaluation of the merits of the request. Such review and evaluation is made by the "Advisory Committee on Isotope Distribution Policy," a committee chosen from a group of technically qualified scientists nominated by the National Academy of Sciences. This committee and its two subcommittees have been highly effective not only in eliminating impractical or unwise applications of radioisotopes, but also in aiding research investigators to correct and revise meritorious plans and techniques so that more accurate results will be obtained. The adoption of comparable procedures in other countries would go far toward assuring (1) maintenance of adequate health and safety standards, and (2) most beneficial utilization of the limited supplies of radioisotopes available in the United States for foreign distribution.

8. The foreign request will be reviewed and evaluated by the "Advisory Committee on Isotope Distribution Policy" as in the case of a domestic request. When the Commission determines that the material can be furnished, the Commission will issue a notice of allocation, and will authorize its designated contractor (e. g., the Clinton Laboratories, Oak Ridge, Tennessee) to make distribution.

9. Shipping instructions should be included with the purchase order. Radioisotopes are sold f. o. b. Oak Ridge, Tennessee. Customs clearance and transportation outside the continental limits of the United States should be arranged by the representative designated pursuant to paragraph 3. Shipments will be consigned collect to the representative via rail or air express, to any point within the continental limits of the United States.

10. Payment will be due and payable on receipt of an invoice from the Commission's designated contractor (e. g., the Clinton Laboratories, Oak Ridge, Tennessee).

Form 313	REQUEST FOR RADIOISOTOPE AEC Form 313 (Jan. 20 47)	LEAVE BLANK
Send original copy only	To: U. S. ATOMIC ENERGY COMMISSION Isotopes Branch, Research Division P. O. Box "E", Oak Ridge, Tennessee	1. Date

NOTE.—Form must be typed with carbon impression on reverse side in order that photo reproduction of extra copies may be made as necessary

2. From: (Name of institution)	3. Location
4. Name of individual making application	5. Title and department

6. If material is to be used secondarily in other departments or in cooperation with other institutions, give details:

## INFORMATION COPY

## SPECIFICATIONS

NOTE.—Use a separate Form 313 for each isotope. Request only in form and quantities given in Price List unless arrangements for other forms have been made through correspondence

7. Price list item number	8. Element and isotope	9. Quantity desired (Specify millicuries or irradiation units)	10. To be delivered at the rate of (Specify quantity per week, month, etc.)
11. Especially undesirable chemical contaminants		12. Especially undesirable radioactive contaminants	
13. Chemical and physical form			
a. First choice		b. Acceptable form	c. Form in which to be finally used
14. Other desirable specifications (not given in availability list)			

## EXPERIMENTAL DETAILS

15. Statement of intended uses, including syntheses to be performed, importance of investigation, etc. (A more extensive description may be attached.)	
16. Sample will be measured as (ash, gas, liquid, etc.)	17. Geometry of sample (thin flat, surrounds counter, etc.)
18. Detection instruments to be used (Specify kinds of instruments and types of circuits.)	
19. Name and experience of person who will supervise measurements	

## EXPERIMENTAL DETAILS FOR "IN VIVO" USES

20. Organisms to be studied (kind)	21. Approximate number
22. Activity to be used per organism	23. Nature of samples to be taken for measurement

## HEALTH PROTECTION AND SAFETY

24. Describe monitoring proposed for health protection (personnel and qualifications, instruments, etc.)
25. Describe proposed disposal method for surplus or waste

## PUBLICATION

26. Publications on this or related problems by the intended users are found in (Name only a few recent papers. In the event applicant has no published articles use space for names of persons familiar with researches)		
Journal	Pages	Date
27. Results of investigations using requested material will be published. Manuscript will probably be submitted to the following publication:		

## SHIPPING

Shipments are made F. O. B. Clinton Laboratories, Oak Ridge. The requester will pay all charges. Special shipping arrangements will be made with Clinton Laboratories after this request has been approved by the Isotopes Branch

## SIGNATURES

It is recognized by the applicant that this request may be referred to an Advisory Committee or to sub-committees nominated by the National Academy of Sciences and that he has no objection to the disclosure of items contained herein to such qualified review. Three copies of published articles resulting from the use of the requested material will be furnished the Isotopes Branch, Research Division.

(Referred to on pp. 264 and 265, pt. 6, June 9, 1949)

## FOREIGN DISTRIBUTION OF RADIOISOTOPES

The purpose of this memorandum is to inform the Department of State of certain considerations relating to the decision of the United States Atomic Energy Commission to permit distribution of specified radioisotopes to qualified users outside the United States, provided a program can be worked out with the Department of State consistent with the Foreign Policy of the United States.

The radioisotopes in question are byproduct materials produced in the uranium chain-reacting pile. They are valuable tools of research, of potential benefit to people everywhere, especially in the field of cancer control and in the study of biological and chemical processes.

Radioisotope distribution within the United States was authorized by the Manhattan District a little over a year ago. The policy then inaugurated is the policy still in force. It provides for screening by an allocation committee which takes account of the facilities of the requester, provisions for safety, the nature of the work proposed, and whether or not the results will be made public. Priority is given to requests for radioisotopes to be used in scientific and medical studies which may yield results that will be published. No security restrictions are placed upon the use of the materials nor upon the publication of the scientific findings.

The administrative machinery for carrying out the domestic policy has proven entirely satisfactory and, to date, more than 1,000 shipments of the 90 regularly available radioisotopes have been made within the United States and to Hawaii. The experience thus gained has satisfied the Commission that the policies established by the Manhattan District are sound and workable and that security has not been prejudiced. It is now prepared to establish a program for the distribution of certain of these radioisotopes to meet the needs of doctors and scientists abroad.

It is proposed that foreign distribution under this program will be in limited quantities and will be made only for uses certified to be for scientific research and for medical therapy. The detailed information to be requested and the undertakings to be made by the recipient are set forth on page 3 below. Such foreign distribution will not interfere with the Commission's continuing program for meeting the needs of qualified doctors and institutions in the United States.

Interest in radioisotopes and skill in their use is not confined to the United States. Foreign doctors in many neighboring and distant countries have learned the technique by employing the natural radioisotopes, the output from their own few cyclotrons, and (before the war) shipments from various institutions having cyclotrons in this country.

Since the availability of pile-produced isotopes has become known, many requests have come to the Commission from abroad. On June 19, 1947, the Isotopes Branch had at hand 96 inquiries from 28 foreign countries. Of these 96 inquiries, 73 asked for radioisotopes for medical research and therapy. Requests from the United Kingdom and the British Commonwealth were greatest in number.

These specific inquiries give some measure of the volume of the needs abroad, but do not immediately indicate another aspect of the matter: Foreign scientists and medical men are generally sympathetic with the wishes of their colleagues for radioisotopes, so that almost every foreign request could, if necessary, be supported by approval from a number of other scientists and doctors. In other words, denial of foreign applications not only disappoints the individual applicant but is a cause for regret among a wide circle of his professional colleagues, and, indeed, is a cause of regret among a large body of professional people who are familiar with the situation in this country.

The foreign governments to which distribution is made will be asked to furnish information concerning the following: (a) The name of the isotopes desired, the quantity, and the time and rate of deliveries, (b) the name of the institution and the names and experience of persons who will use the materials, (c) the purposes for which the materials will be used, and (d) the health and safety measures to be employed. In addition, the foreign government will be asked to make the following undertakings:

(a) That, (1) at intervals of 6 months after materials have been furnished for scientific investigation, three copies of a progress report on the results of such investigation will be furnished to the United States Atomic Energy Commission, and (2) if the results of such investigation are of sufficient interest to be published, they will be published in an appropriate technical or scientific publication, or permission to arrange for publishing such results will be granted to the Commission.

(b) That the materials will not be used in a manner other than as disclosed in the request.

(c) That qualified scientists irrespective of nationality will be permitted to visit the institutions where the materials will be used and to obtain information freely with respect to the purposes, methods and results of such use, in accordance with well established scientific tradition.

The Commission has considered this program for distribution, weighing particularly its technical advantages and potential disadvantages to the United States, and has concluded that the recognizable advantages outweigh the possible dangers.

It should be understood clearly that, under the program proposed, the Commission will not authorize any foreign distribution of those radioisotopes which there is any reason to believe would further the development of atomic energy for military or industrial purposes by any foreign government or any person abroad.

Foreign distribution will not be authorized for naturally radioactive materials, that is, the natural elements of higher atomic number than element 83 (bismuth).

Foreign distribution will not be authorized for any newly produced heavier element of higher atomic number than element 92 (uranium).

The Commission proposes to authorize foreign distribution of limited quantities of the following radioisotopes:

Antimony 122; 124; 125	Cobalt 60	Potassium 42
Argon 37	Copper 64	Silver 108; 110; 111
Arsenic 76; 77	Gold 198; 199	Strontium 89
Bromine 82	*Iodine 131	Sodium 24
Calcium 45	Iron 55, 59	*Sulfur 35
*Carbon 14	Mercury 197; 203; 205	Zinc 65, 69
Chlorine 36	*Phosphorus 32	

This list contains 20 of the 90 radioactive elements now regularly available for distribution within the United States. It includes those which have been proved most widely useful for research particularly in the biological and medical sciences, and for therapy, and which have been most frequently requested by foreigners. Rare earth isotopes are excluded as well as isotopes of peculiar interest to the Commission's major activities.

The radioisotopes listed above are radioactive forms of ordinary elements which are found in nature in stable form. The Department of State will be notified in advance of any proposed deletions from, or additions to, the list.

A question which must be most carefully weighed is: Will such distribution aid foreign development of atomic energy or utilization of fissionable materials? If the conditions laid down in the proposed program are adhered to, it could safely be said that such developments would not be aided. It cannot be assumed, however, that these conditions will be carried out in all cases, for some shipment abroad might fall into the hands of capable persons who wish to develop atomic weapons. The problem then becomes purely a technical problem: what is the probability that these persons will find the proposed shipments useful to this end? The following facts, some of which have already been mentioned, bear on this problem:

(a) The radioisotopes proposed for distribution are in no way different from those which have been and still are available to foreigners from cyclotron sources abroad.

(b) The quantities it is proposed to distribute can be controlled and can be made less than a concentrated national effort with cyclotrons or other sources would produce.

\*The isotopes marked with an asterisk will be distributed in "separated" form, i. e., obtained by chemical separation from material which has been irradiated in the pile. The other isotopes will be distributed in the form of "irradiation units," i. e., obtained by irradiating specified quantities of material in the pile without subsequent chemical separation.

(c) None of the radiations emitted by these radioisotopes is unfamiliar; they are all available to foreign workers from natural radioisotopes, cyclotron-produced isotopes, or X-ray machines.

(d) None of the radioisotopes proposed for distribution was significantly useful in the development of atomic weapons in the United States.

(e) The quantities are far too small to be of practical use as radioactive poisons; they could be used for certain studies of radiation hazard, but the natural radioisotopes already available abroad are equally good (in some respects better) for such studies.

(f) The radioactive strength of the materials decays with time, the radioisotopes transforming to stable isotopes which are already abundant abroad and are of no special value in atomic energy developments. The radioactivity is a transient effect, and must be used before it is gone. In the few cases where the decay is very slow the initial strength of the sample is by nature correspondingly low. Stock piling, in short, is not feasible.

It appears from these facts that the proposed distribution is not likely to aid directly any foreign nation in the development of atomic energy.

On the other hand, the proposed distribution will entail certain general results which must be mentioned and considered:

(a) More foreign scientists will be encouraged to skill themselves in the techniques of handling radioisotopes. A large supply of scientists trained in this field is an asset to any nation contemplating development of atomic energy. However, it is to be noted that such training can be acquired equally well with the natural radioisotopes, and a nation intent on developing quickly a supply of technicians skilled in these matters would not be at all dependent upon the shipments from this country.

(b) Significant discoveries in general science and in medicine will be expected to be made abroad, as they have been made in this country, by use of the radioisotopes. The prosperity and well-being of foreign nations will presumably be increased by such discoveries, and their military potential will be increased accordingly. However, the military advantage foreign nations will gain in this fashion is obviously less direct, less predictable, less immediate, and less disadvantageous to the United States than the advantage they will gain by accepting our exports of foods, lathes, and bulldozers.

(c) There is some small risk that a major discovery of great military importance will be made abroad by use of the radioisotopes. No such discovery is foreseeable now in this country. On very general grounds, it can be argued that experiments with cosmic rays or microbes (neither of which is controllable by the Commission or the United States) are equally likely to yield such a major discovery. In short, this risk, while it exists in principle, cannot be thought substantial.

This program will not enable persons abroad to obtain significant information on classified production processes in use in the United States. In this connection:

(1) The proposed program will exclude from foreign distribution all but two of those radioisotopes which are "fission products," that is, which result from fission. (The exceptions, Iodine 131 and Strontium 89, are discussed later.) In consequence, users abroad will have no opportunity whatever to divert radioisotopes, even in minute quantities, for use in studying means of separating fission products in any test plutonium production process they might attempt.

(2) Iodine 131, which has proved its importance in the treatment of thyroid conditions, will be distributed abroad under this program. This radioisotope is producible both by uranium fission and by the transmutation of tellurium. In the plutonium separation process, the Iodine 131 is evolved as a gas and its separation presents no technical problem. The possession of Iodine 131 will not assist any foreign government or any person abroad in studying the technical problems of separation inherent in any plutonium production process.

(3) Strontium 89 is readily made with cyclotron and was so made before the war. Its properties are well known. It is simply more convenient to obtain Strontium 89 by separation from the fission products than by other means.

#### SUMMARY

The radioisotopes now proposed for foreign distribution are all isotopes of elements used significantly in the human body or in studies of therapeutic agents. The possibilities of diversion from the use certified in the application are remote and in any event would create no significant hazard: (1) Only very limited quantities would be sent abroad, (2) they would be sent to a large number of dif-

ferent users, (3) much of the material remains radioactive for only a short time, and is expended in the process of the research, (4) reports of the work done will in large part disclose the uses to which they actually have been put, and (5) United States scientists will be able to visit the institution where the materials are used and observe the methods and results of such use.

The contributions of this program toward assuring the common defense and security of the United States are believed to be substantial though indirect. Among scientists and medical men abroad there has been growing dissatisfaction from the withholding of all radioisotopes from foreign distribution. The scientists and medical men in this country share the dissatisfaction of their foreign colleagues and are generally sympathetic toward some program of foreign distribution. Our own people's concern often takes the form of fear lest the national program for atomic energy place restrictions on scientific research far beyond what is wise in the interests of our national security, which depends upon continued progress in this field. It is believed that the program under consideration will make it generally easier for the Commission to enlist the wholehearted support of United States scientists and medical doctors for our national program for atomic energy and that such support will add strength to our common defense and security.

The results of foreign researches with radioisotopes, when published in accordance with the undertakings, will be available to the United States for whatever exploitation they suggest. With its superior technological potential, the United States can expect to profit more quickly and more fully than any other nation from exploitation of published scientific findings—this has been the fact with many past discoveries, including the discovery of nuclear fission.

---

**ATOMIC ENERGY COMMISSION—MEMORANDUM FOR INFORMATION—FOREIGN DISTRIBUTION OF RADIOISOTOPES—MEMORANDUM BY THE GENERAL MANAGER, OCTOBER 10, 1947**

Attached is a memorandum from the Manager of Oak Ridge Operations authorized the procedure for the handling of foreign requests for radioisotopes.

On September 30, 1947, the procedure outlined was approved with the understanding that, until further notice, foreign distribution will be limited to the isotopes listed in the September, 1947, catalogue and price list issued by the Isotope Branch, entitled "Radioisotopes for International Distribution". Copies of this catalogue and other referenced material are available from the Secretariat files upon request.

SEPTEMBER 26, 1947.

To: Carroll L. Wilson, General Manager.

From: John C. Franklin, Manager, Oak Ridge Operations.

Subject: Procedure for handling foreign requests for radioisotopes.

On September 18, 1947, a meeting was held in the Washington office to discuss and plan the detailed procedure for international distribution of radioisotopes. In attendance were: R. B. Snapp, Jr., and W. S. Trueheart, representing the Washington office; Dr. Paul C. Aebersold, and T. R. Jones, representing the Isotopes Division, Oak Ridge operations.

The official announcement of foreign distribution and a statement of general policy is contained in a statement, "Foreign Distribution of Radioisotopes, Information for Foreign Governments Concerning Procedure for Obtaining Radioisotopes." The statement was issued September 4, 1947, by the Commission and distributed by the State Department to recognized diplomatic missions.

As agreed in the Washington meeting the Isotopes Division has prepared an outline of the procedure to be followed in the processing of foreign requests for radioisotopes:

1. Copies of diplomatic notes, including the name of the designated representative, filed by a foreign government with the State Department pursuant to paragraph 3 of the September 4 announcement, will be obtained by Mr. Snapp and forwarded to the Isotopes Division in Oak Ridge. Copies of the reply of the

State Department to the foreign government will be forwarded in the same manner.

2. On receipt of the above the Isotopes Division will forward a letter to the designated representative of the foreign government which will include:

- (a) Acknowledgment of his appointment.
- (b) Name of the official liaison officer to be contacted in the Isotopes Division on radioisotopes procurement matters.
- (c) Instructions for obtaining a license for export of radioisotopes from the Department of Commerce.
- (d) Information on the circulars concerning isotope procurement and health protection which may be obtained from the Isotopes Division.

(e) Request for the names of the advisory committees and subcommittees which may be authorized to screen requests for the foreign government.

3. An application received directly from a scientist of a foreign country which has established channels for procurement will be forwarded to the official representative of his country for resubmission through approved channels.

4. An application received from a national of a foreign country which has not filed undertakings or has not appointed an agent will be returned to the applicant with the suggestion that he return the request through official channels which may be established by his government.

5. Each request will be checked for the following particulars:

- (a) Name and item number of radioisotope desired (as listed in the catalog).
- (b) Quantity desired.
- (c) Desired time and rate of deliveries.
- (d) Names and experience of persons who will use materials furnished.
- (e) Name of institution at which materials will be used.
- (f) Purposes for which materials will be used.
- (g) Health and safety measures to be employed.

6. Each request will be checked for inclusion of the following statements:

(a) That, (1) at intervals of 6 months after delivery of each shipment of radioisotopes to the representative of a foreign government for forwarding to an investigator in the country he represents, three copies of a progress report on the results of the investigation will be furnished to the United States Atomic Energy Commission, and (2) the results of such investigation if publishable by nature either will be published by the author in an appropriate technical or scientific publication or permission to arrange for publishing such results will be granted to the Commission.

(b) That the materials will not be used in a manner other than as disclosed in the request.

(c) That qualified scientists irrespective of nationality will be permitted to visit the institutions where the materials will be used and to obtain information freely with respect to the purposes, methods, and results of such use, in accordance with well-established scientific tradition.

7. Each request will be reviewed for technical details in the same manner as prescribed for domestic requests.

8. Before final affirmative action is taken on requests from Russia or Russian-dominated countries the matter will be referred to the general manager.

9. The Isotopes Division will maintain records of individual requests received and action taken, including: Isotope ordered, quantity shipped, purpose or use of isotope, receipt of progress reports.

10. Summary or detailed reports will be available at the request of the general manager.

11. A printed application form designed to provide information required in section 5 above will be made available to designated agents. Statements required under section 6 above will also be printed on the application form as an added convenience and to avoid misinterpretation or misunderstanding.

Copies of the following are attached for your information:

1. Foreign Distribution of Radioisotopes, a statement prepared by the Commission, dated September 4, 1947.

2. List of diplomatic missions which have received copies of the above statement.

3. Radio isotopes for International Distribution, a catalog and price list issued September 1947.

The above procedures have been considered by this office. They are forwarded with our recommendation for your approval.

JOHN C. FRANKLIN.

NUCLEONICS PROJECT,  
GENERAL ELECTRIC Co.,  
*Schenectady 5, N. Y., July 11, 1949.*

JOINT COMMITTEE ON ATOMIC ENERGY,  
*Senate Office Building, Washington, D. C.*

GENTLEMEN : On June 15 at the hearings held before your committee, we agreed, as set forth on pages 346 and 347 of the printed hearings, to furnish information concerning the portion of the total 234-5 project costs which was involved in the unique type of equipment and facilities that go into the building. Mr. Winne has asked me to transmit to you the attached tabulation.

This tabulation shows that we estimate that approximately 65 percent of the construction cost of this project was accounted for by the unique type of equipment and facilities required.

Yours very truly,

R. S. NEBLETT,  
*Assistant General Manager, Nucleonics Department.*

*Total 234-5 project costs*

	Amount	Ratio to direct construction cost
		<i>Percent</i>
Direct cost of "unique type of equipment and facilities".....	\$11, 253, 009	65
Direct cost of main building structure.....	3, 548, 772	21
Direct cost of temporary construction, site work, utilities, and structures other than the main building.....	2, 365, 735	14
Total direct construction cost.....	17, 167, 516	100

EXHIBIT 16

(See also Exhibits 24 and 35)

(Referred to on pp. 457 and 476, pt. II, June 20, 1949)

UNITED STATES ATOMIC ENERGY COMMISSION,  
*Washington, D. C., July 14, 1949.*

Mr. WILLIAM L. BORDEN,  
*Executive Director, Joint Committee on Atomic Energy,*  
*Washington, D. C.*

DEAR MR. BORDEN : The following material is supplied with reference to Mr. Elston's request of Mr. Pike at the June 20 hearings (p. 457 of the printed hearing) regarding formal action taken by the Commission in connection with the Joint Committee Report on the Natural Gas Pipe Line.

As indicated in the Commission's press release of May 28, a copy of which is attached, the report of the subcommittee was given careful attention by the Commission. Shortly after the report was issued, the Director of Production was directed to prepare a report to the Commission on the matter. Formal action was taken by the Commission at Meeting 278 on June 13, 1949, at which the following Commissioners were present :

David E. Lillenthal  
Sumner T. Pike  
Lewis L. Strauss  
Henry D. Smyth

On the following day at Meeting 279 on June 14, 1949, the matter was again discussed. The following Commissioners were present:

David E. Lillenthal  
Sumner T. Pike  
Lewis L. Strauss  
Henry D. Smyth  
Gordon E. Dean

At the meeting on June 13 the report of the Director of Production, the report of the subcommittee and the action taken by the full committee were reviewed by the Commission. It was decided that further discussion with the Joint Committee should be proposed. At the second meeting, after further review, a draft letter to the Joint Committee was considered and its use as a basis for discussion with the Committee was approved. It was further noted that no change would be made in the present plans to bring natural gas to Oak Ridge.

As indicated in the record of the hearings this letter was never sent to the Committee since the Commission then learned that the matter was to be taken up within a few days in the course of the present hearings.

Sincerely yours,

Carroll L. Wilson,  
CARROLL L. WILSON, *General Manager.*

Enclosure: May 28 press release.

UNITED STATES ATOMIC ENERGY COMMISSION,  
*Washington 25, D. C.*

(Information for the press. For immediate release. No. 179, May 28, 1949)

The Atomic Energy Commission has received from a special Subcommittee of the Joint Congressional Committee on Atomic Energy a report on the action taken by the Commission to secure natural gas as a fuel for the power plant at the Oak Ridge installation which produces uranium 235, one of the two fissionable materials on which the atomic energy program is based. The report is under study by the Commission.

In response to press requests for comment on the matter, the Commission calls attention to the letter of May 9, 1949, from Acting Chairman Sumner T. Pike to the Chairman of the Subcommittee (appearing on page 3 of the Subcommittee report) which points out that \* \* \* "Our action to obtain natural gas for the K-25 plant may be viewed as an excess of caution. We firmly believe however the position of the K-25 plant in the atomic energy program and the vital necessity of the plant's continuous operation warrants and demands the present plan of having both a stock pile of coal and a supply of natural gas available at Oak Ridge. In summary we believe that by having both coal and natural gas, we have, in effect, 'two strings to our bows' and as a result have materially increased the security of the plant at less cost to the Commission than if we relied solely on coal."

In connection with the matter of costs, Walter J. Williams, Director of Production, pointed out that the Commission will not incur any capital expenditure save for \$240,000 to convert the boilers to the use of natural gas instead of coal. Mr. Williams said further, as he had previously stated in testimony before the Federal Power Commission, that at current prices for both fuels, the use of natural gas will bring about a saving to the government of about \$1,200,000 per year.

UNITED STATES ATOMIC ENERGY COMMISSION,  
*Washington 25, D. C., July 11, 1949.*

Mr. WILLIAM L. BORDEN,  
*Executive Director, Joint Committee on Atomic Energy,*  
*United States Capitol, Washington, D. C.*

DEAR MR. BORDEN: Reference is made to Mr. Cole's request on page 476 of the printed hearings (June 20, 1949) for information concerning the corporate structure, the incorporation, the incorporators, and the stockholders of the East Tennessee Natural Gas Co.

The information given below was furnished us by the law firm of Whitaker, Hall & Haynes of Chattanooga, Tenn.

The East Tennessee Natural Gas Co. is not owned or controlled by any other corporation and no substantial stock interest is held in it by any other corpora-

tion. Tennessee Natural Gas Lines, Inc., which supplies gas to Nashville, Tenn., and which was formed by a number of the same group that later formed the East Tennessee Natural Gas Co., holds 24,582 shares of the common stock of East Tennessee. The capital structure of East Tennessee is as follows: The company has outstanding at the present time 400,000 shares of common stock of a par value of \$1 per share. It also has outstanding two series of interim notes. Series A of interim notes is in the principal amount of \$1,900,000 and series B is in the principal amount of \$440,000. The notes are payable December 31, 1950. The series A notes are dischargeable in preferred stock of the company which is in turn convertible into common stock of the company, and the series B notes are dischargeable in common stock of the company. The company has outstanding first-mortgage bonds in the principal amount of \$7,700,000. These bonds are owned as follows: Metropolitan Life Insurance Co., \$4,500,000; New York Life Insurance Co., \$1,200,000; and Mutual Life Insurance Co. of New York, \$2,000,000. Series A notes of the company referred to above are held by a group of 16 individuals and companies located in New York and other States. Each of them made certificates that they were acquiring the notes for investment and not for resale. The series B notes are held chiefly by stockholders of the company.

Eighteen thousand shares of the common stock were purchased by White, Weld & Co., and F. S. Moseley & Co. who handled the financing. The original East Tennessee Natural Gas Co. was organized April 16, 1947. The purpose was to obtain a certificate from the Federal Power Commission on the basis of which the company would serve Chattanooga and Knoxville and intervening areas with natural gas. Its incorporators were Dawson Hall, William W. Haynes, Phil B. Whitaker, Garrison Elder, D. B. Harris, and Felix G. Miller. The first three above-named incorporators are members of the law firm of Whitaker, Hall & Haynes of Chattanooga, Tenn. Mr. Elder is a member of Elder & Co., a stock brokerage firm of this city. Mr. Miller is the owner and operator of Miller Bros., the largest department store in Chattanooga.

Immediately after incorporation the stock was issued to a group of individuals including the above-named incorporators most of whom were citizens and residents of Tennessee. There follows a list of the principal original shareholders with their business associations:

Wade V. Thompson, Nashville, Tenn., who was previously interested in the natural gas business.

Rhoton P. Clift of Chattanooga, Tenn., coowner and president, Clift-Smith Co., International trucks, Farmall tractors, McCormick Deering farm equipment, Chattanooga, Tenn.

F. M. Cantrell, chairman, board of directors, Citizens' National Bank, Athens, Tenn.; president, Cantrell Banking Co., Etowah, Tenn.; executive vice president, Tennessee Natural Gas Lines, Inc., Nashville, Tenn.; president, Etowah Trust Co., Etowah, Tenn.

H. S. Walters, president, Hamilton National Bank, Morristown, Tenn., and contractor, Walters & Prater, Morristown, Tenn.

J. Carmichael Greer, president, Bacon Hosiery Mills, Lenoir City and Loudon, Tenn.

O. L. Garrison Elder, partner in investment brokerage company, Elder & Co., 61 Broadway, New York, N. Y., and James Building, Chattanooga, Tenn.

Thomas W. Goodloe, vice president, Equitable Securities Corp., Nashville, Tenn.; secretary, Tennessee Natural Gas Lines, Inc., Nashville; vice president, Nashville Gas & Heating Co.; member, executive committee and director of the Alabama Mills Co., Alabama.

Felix G. Miller, president, Miller Bros. Co., Chattanooga; secretary treasurer, Miller-Smith Hosiery Mills, Inc., Chattanooga; president, Kuttner's, Inc., Rome, Ga.; president, Broad Street Garage, Chattanooga; president, Broad Street Co. (real estate), Chattanooga; secretary-treasurer, Miller Investment Co., Chattanooga; president, Comet, Inc. (restaurant), Chattanooga; director, Standard Coosa-Thatcher Co., Inc. (yarn manufacturing), Chattanooga; director, Hamilton National Bank, Chattanooga.

Dawson B. Harris, president, Hamilton National Bank, Chattanooga; president-director, Hamilton Association, Chattanooga; director, Hamilton National Bank, Knoxville; director, Tennessee Natural Gas Lines, Inc., Nashville; director, Interstate Life & Accident Co., Chattanooga; director, Title Guaranty & Trust Co., Chattanooga.

Phil B. Whitaker, attorney at law, senior member of firm of Whitaker, Hall & Haynes, Chattanooga, Tenn.

These stockholders have remained stockholders and principal figures in the operation of the company to the present time.

Sincerely yours,

CARROLL L. WILSON, *General Manager.*

### EXHIBIT 17

(Referred to on p. 546, pt. 13, June 22, 1949)

(At the request of Senator Eugene Millikin, the following extracts are taken from the AEC General Manager's Bulletins)

GM-43 (Sept. 2, 1947), Office of Hanford Directed Operations:

"\* \* \* The Office, under the direction of the Manager of Hanford Directed Operations responsible to the General Manager, is authorized and directed to administer the functions indicated below in accordance with approved programs and policies and subject to such controls and staff supervision as the General Manager and Commission shall establish.

"The Manager of Hanford Directed Operations participates as a member of the General Manager's staff in the review of the AEC program to assure the soundest development of policy and the most effective and economical administration of direct and contract activity. \* \* \*

#### "I. MAJOR OPERATING FUNCTIONS

"In connection with the functions indicated below, the office of Hanford Directed Operations shall: (a) negotiate or participate in the negotiation of contracts, (b) assist prime contractors in carrying out Commission approved programs by aiding them in securing scientific and technical assistance and legal, budgetary, personnel, and other management services of the Commission, equipment and materials, subcontractors' services, and such other facilities as will aid them in discharging their responsibilities, and (c) assure compliance by the contractors with the general policies and with the security, fiscal, personnel, budgetary, and other controls established by the General Manager and the Commission.

"The principal functions carried out under the authority of the Office of Hanford Directed Operations are:

- "1. \* \* \*
- "2. \* \* \*

"3. The construction of new and the operation and maintenance of existing production, research, and community facilities at Hanford.

#### "II. DELEGATIONS AND INSTRUCTIONS

"1. *Make and administer contracts.*—Make purchases and enter into, extend, and modify contracts, except that each purchase, new contract, extension, or modification in excess of \$5,000.00 shall be subject to the approval of the General Manager; and act as the representative of the Commission for the administration of contracts executed under his authority or assigned for administration to the office of Hanford Directed Operations.

"2. *Establish positions and make appointments.*—Establish positions and appoint officers and employees.

"*Instructions.*—The employment and promotion of persons appointed to the following positions shall have prior approval of the General Manager: (a) All persons appointed to positions involving principal supervisory responsibilities for major functional units, (b) \* \* \*, (c) all persons appointed by contractors to positions at annual salaries of \$15,000 or above."

Bulletin GM 128 (March 15, 1949):

"Supervision of Construction and Related Activities:

"1. *Purpose.*—The purpose of this Bulletin is to spell out more distinctly the specific responsibilities of the Operations Office and Washington Divisions with regard to construction programs and related engineering, and to establish certain fundamental requirements for effective administration of these activities.

"2. *Background* \* \* \*

"3. *Division of Responsibilities.*

"(a) Responsibilities of Operations Offices: the Managers of Operations have prime responsibility for determining and carrying out construction and related engineering programs required to perform their assigned operating programs. Included as necessary parts of this responsibility are the functions of:

"(1) Initial study and the establishment of the functional requirements of the facilities and structures to be designed and built;

"(2) The development of construction programs, budgets, and work schedules;

"(3) The execution of construction programs in accordance with applicable policies, standards, budgets, and work schedules;

"(4) The submission of the above matters for approval when required; and

"(5) Providing the appropriate Washington Division with timely information on significant work programs, projected or in progress, so that their respective responsibilities can, in turn, be carried out."

Bulletin GM 125:

"Contract Manual for Engineering and Construction Services \* \* \* Contract Boards:

"1. *Purpose*.—The purpose of this Bulletin is to make effective the contract manual for construction and associated engineering services and to provide for the establishment of Contract Boards in the several Offices of Operations.

"2. *Contract Manual*.—The Contract Manual provides the policies, practices, and procedures to be followed by the Commission and its field offices in contracting for construction and associated architectural engineering services."

MAY 23, 1949.

INVITATION—COMMERCIAL FACILITY—LOCAL NEWSPAPER—RICHLAND, WASHINGTON

I. Bids are hereby invited for the use of land as a site for plant and offices and use of utilities and other services necessary in the operation of a newspaper or newspapers for general circulation, to be located, published and printed at an acceptable business site or sites in Richland, Washington. Sites will be made available to any number of responsible newspaper publishers who wish to enter the field in Richland.

II. It is proposed that the successful bidder(s) will construct building(s) at bidder's expense on land owned by the Government. (If any items in the Invitation to Bid, Bid and Lease Form are not clearly understood, Bidders are invited to contact the General Electric Commercial Facilities Division in person or on phone Richland 384.)

III. The town of Richland is located entirely on land owned by the United States, and is operated by the General Electric Company (hereinafter referred to as General Electric) as prime contractor for the Atomic Energy Commission (hereinafter referred to as the Commission) under Contract W-31-109 Eng.-52, dated May 15, 1946, and subsequently amended. The information contained in the attached brochure is supplied for Bidders' convenience only, and neither General Electric nor the Commission makes any guaranty or warranty, express or implied, as to matters presented.

IV. Bidders are invited to study the business prospects of the Richland Area. The successful bidder(s) shall assume the risk of all developments and changes in the community of Richland.

V. Bids will be submitted in quadruplicate, in an inner and outer envelope, on the attached form of Bid. The inner and outer envelopes, which shall contain the Bid, shall be sealed, shall clearly indicate that they contain a Bid for this facility, and shall bear a return address. The outer envelope shall bear the following address:

Personal—Mail Room, Do NOT OPEN.  
General Electric Company,  
Richland, Washington.

Attention: Commercial Facilities Division—Bldg. 761.

Bids will be received at the above address until (2:00 P. M. Standard Time, Tuesday, July 12, 1949, at which time they will be opened in the presence of any of the

Bidders who desire to appear. Notification of the Successful Bidder(s) will be made as soon thereafter as practicable.

VI. The Successful Bidder(s) will be required to proceed with the construction of the building(s) and operation of business in strict accordance with the terms and conditions contained in the Bid and in the Lease Form attached hereto, and by this reference, made a part hereof, and prior to the commencement of any work hereunder, will enter into a Lease with General Electric subject to the approval of the Commission. Note ARTICLE XXVI of Lease Form, which provides that "The Lessor reserves the right to grant leases to others to operate similar or identical businesses at the Hanford Works, or to permit the conduct of similar or identical businesses under any other arrangement."

VII. The monthly payments which will be payable to General Electric under the Lease will be as outlined by the Bidder(s) in Article III of the attached Bid Form. No bid will be considered unless: (1) the lease payments offered under Article III of the attached bid form are sufficient in the opinion of General Electric and Atomic Energy Commission to cover utilities and services furnished and a reasonable payment for the use of the land; (2) adequate evidence is submitted to demonstrate the financial responsibility of the Bidder(s) to construct and equip the building.

VIII. Attention is invited to the policy and objectives of the Commission and the General Electric Company to the effect that the purpose of competitive bids on the publication of newspapers in the town of Richland is to obtain under equitable conditions a locally produced newspaper or newspapers for the town of Richland and to insure fairness to all interested parties in the assignment of sites for places of business. This is not an invitation to bid for the exclusive privilege of operating a newspaper in the town of Richland. Any and all bidders who meet the terms of this invitation and bid form may, if they choose, operate a newspaper in the town of Richland.

IX. Six sites are available for the location of newspaper plants in Richland and are shown on town maps which may be obtained at the office of the Commercial Facilities Division, General Electric Company, Richland, Washington. Bidders may bid on any one or all of the sites. The sites which have been made available include two sites on the primary traffic artery in areas zoned "Commercial", two sites on a secondary traffic artery in the areas zoned "Commercial", and two sites in areas zoned for "Light Industrial". Each successful bidder will be assigned one site only. A bidder who submits the highest bid on more than one type of site may select the type of site he desires, with selection limited, however, to the type upon which he has bid, and the award for the site which he elects not to take may be made to the second highest bidder.

X. Bidders shall complete the Bid Form in detail and shall specifically set forth:

A. A statement of the maximum number of calendar days after date of receipt of notice to proceed in which Bidder will complete the construction of the building(s), install equipment and be ready to begin the operation.

B. Information as to type, dimensions and design of the building(s) to be constructed.

C. Information as to the type of services to be furnished.

XI. Building(s) shall be constructed entirely at the expense of the Successful Bidder(s), and neither General Electric nor the Commission will assume any financial or other responsibility for the construction or maintenance of the building(s) or for the operation of the business.

XII. Since the primary purpose of this invitation to bid is the establishment of representative newspaper or newspapers for the town of Richland, locally edited, printed and published, it is expected that successful bidders will devote a reasonable amount of news column space to report news of direct local interest.

Very truly yours,

R. J. PEDERSON,  
*Superintendent, Commercial Facilities Division.*

Return Receipt Requested.

LEASE FORM

#### COMMERCIAL FACILITY LEASE—NEWSPAPER

THIS LEASE, entered into this \_\_\_\_\_ day of \_\_\_\_\_, 19\_\_\_\_, by and between GENERAL ELECTRIC COMPANY, a corporation organized and existing under

the laws of the State of New York with principal offices in the City of Schenectady, New York (hereinafter referred to as LESSOR), and -----

-----  
 a corporation organized and existing under the laws of the State of -----,  
 a partnership consisting of -----,  
 an individual trading as -----  
 of the City of -----, in the State of -----,  
 (hereinafter referred to as LESSEE) :

**WITNESSETH THAT:**

WHEREAS Lessor, as a Pure Cost Contractor, has heretofore, to wit, on the 15th day of May, 1946, entered into a contract (W-31-109 Eng. # 52) which has been subsequently amended, and as amended, is hereinafter called the "principal contract" with the United States of America, hereinafter called the "Government", represented by the United States Atomic Energy Commission, hereinafter called the "Commission", to operate, expand and maintain the Hanford Works including the Community of Richland, Washington; and,

WHEREAS pursuant to such contract, Lessor with the approval of the Commission invited Bids for the construction and operation of ----- (hereinafter referred to as the "Facility"), upon land owned by the Government, and the Lessee was the successful bidder;

Now, THEREFORE, the Lessor hereby leases to Lessee and Lessee hereby leases from the Lessor, subject to the conditions and covenants hereinafter set forth in Articles I to XXXVI, inclusive, the following described premises: -----

**ARTICLE I. TERM**

The term hereof shall be ----- years, commencing -----, 19--,  
 and ending -----, 19--, unless sooner terminated pursuant to the provisions of Article XII. At the expiration of this Lease the Lessee shall have the option of renewing the Lease for a term of ----- years upon the same terms and conditions as are contained herein, except that the amount of the payments payable under the renewed Lease shall be renegotiated. The Lessee shall exercise his option to renew in accordance with the preceding sentence by giving written notice of intention so to do not less than six months prior to expiration. Failure of the Lessor to receive such written notice shall be deemed to be conclusive evidence of the Lessee's intention not to exercise renewal option.

**ARTICLE II. USE OF PREMISES**

The demised premises shall be used by the Lessee for the construction, maintenance, and operation of -----  
 and for no other purpose, unless the Lessor authorizes other and/or additional uses in writing in advance.

**ARTICLE III. RENT**

Lessee shall pay to Lessor at Lessor's office at Hanford Works, Richland, Washington, or elsewhere, as designated from time to time by Lessor, the following amounts as rent for the use of the premises herein demised:

1. During the course of construction, a fee sufficient to cover cost of building permit, inspections, and water and electricity used during course of construction, to be established by Lessor.

2. From and after -----, monthly rental in the amount of \$-----, in return for utilities, services, and ground use; such payments to be made on or before the 15th day of the next succeeding calendar month.

3. Interest computed at ---% per annum from due date of each payment, and upon each defaulted obligation, until paid.

**ARTICLE IV. TITLE TO BUILDING(S)**

It is understood and agreed that the premises demised hereunder are owned by United States of America; that the Lessor is entering into this Lease pursuant to the principal contract; and that any building(s) to be erected hereunder by the Lessee shall be and remain, during the term of this Lease and any renewal hereof, the property of the Lessee, irrespective of the manner in which the building(s) may be affixed to the land.

## ARTICLE V. ENCUMBRANCES AND ASSIGNMENTS

1. Except with the prior written approval of the Lessor, which approval shall not be unreasonably withheld, the Lessee shall not sell, assign, mortgage, lease, sublease, license or otherwise dispose of or encumber, in whole or in part, the leasehold estate hereby created or the building(s) to be erected hereunder, nor suffer any voluntary or involuntary transfer or disposition of title or encumbrance to be made, and the Lessee will indemnify and keep indemnified the Lessor and the Commission against losses resulting from the payment of any lien, charge or encumbrance. Nothing herein contained shall empower Lessee to do any act which can, may or shall cloud or encumber the Government's title to the land.

2. If, pursuant to the written consent of the Lessor, Lessee shall mortgage, pledge or otherwise encumber the leasehold estate hereby created or the building(s) to be erected hereunder, then no termination provided for under Article XII, Section 1, of this Lease shall impair the validity of any such lien or encumbrance. Any notice of default on the part of the Lessee or intention on the part of Lessor to terminate or revoke this Lease shall be mailed to the agent designated by the mortgagee, pledgee, or other encumbrance-holder; provided, however, that no notice of such default or intention to terminate shall be required to be given to said mortgagee, pledgee or other encumbrance-holder, if he fails to designate such an agent.

## ARTICLE VI. CONSTRUCTION

The Lessee agrees that he will, at his own cost and expense and pursuant to the following provisions, commence and complete construction of the building(s) to be utilized in the operation of the Facility:

1. The Lessee, before proceeding with the construction of the proposed building(s), shall submit to the Lessor, for inspection and approval by the Lessor, three copies of the completely executed contract between the Lessee and his architect and builder and three copies of completed drawings and specifications covering the proposed building(s).

2. The Lessee shall furnish the Lessor with one set of "as built" reproducible plans pertaining to the original building(s) and to any subsequent additional building alterations or additions, immediately following approval by Lessor and Commission of completed work.

3. Work on the building(s) shall be commenced as soon as practicable after receipt by Lessee, from Lessor, of notice of approval of the executed contract, drawings and specifications, and work shall be completed in accordance therewith not later than \_\_\_\_\_, 19\_\_\_\_, or as this time may be extended by the Lessor because of delays beyond the control of the Lessee.

4. Whenever an actual or potential labor dispute or work stoppage arising therefrom, is delaying, or threatens to delay, the timely performance of work in connection with such building(s), the Lessee shall give immediate notice thereof to the Lessor. Such notice shall include all relevant information with respect to such dispute.

5. The Lessee, shall procure or cause to be procured, all licenses, permits, franchises, easements, rights of way, or other interests in real property necessary for the performance of work in connection with the construction of building(s).

6. In the construction of the building(s) hereunder, the Lessee covenants that he will not pay, or allow to be paid, any wages or allowances in excess of those prevailing at Hanford Works.

7. The Lessor shall extend existing water, electrical and sewer facilities to an agreed point near the building wall, at no additional cost to the Lessee.

8. The Lessor and the Commission shall have the right to inspect, in such manner and at such times as are reasonable, the work in process of construction.

9. The Lessee shall, at the discretion of the Lessor, require any or all of his contractors to furnish adequate performance and payment bonds.

## ARTICLE VII. OPERATION OF THE FACILITY

The Lessee shall, at his own cost and expense, and pursuant to the following provisions, operate the Facility on the demised premises:

1. The Lessee shall maintain such stocks of merchandise, provide such services, employ sufficient personnel, furnish and install such fixtures and equipment and do all things necessary to render efficient and convenient service to customers.

2. The Lessee shall keep the premises open and available for business activity therein during all usual days and hours for such business in the community except when prevented by strikes, fire, casualty or other causes beyond Lessee's control and except during reasonable periods for repairing, cleaning, decorating, and for such other purposes as may be approved by the Lessor.

3. The Lessee shall include the address and identity of the Facility and the demised premises in all advertisements made by Lessee in which the address and identity of any other similar business conducted by Lessee in the vicinity of Richland, Washington, shall be mentioned, and shall not divert elsewhere any trade, commerce or business which ordinarily would be transacted by Lessee in or from the demised premises, either during the period of construction of the building(s) hereunder or after completion thereof.

4. The installation, display, painting, affixing, or maintenance of signs, notices, pictures, billboards or other advertising material outside the building(s) shall be subject to the approval of the Lessor, and the Lessee shall remove all such signs, notices, pictures, billboards or other advertising matter from the building(s) and premises at any time when directed by the Lessor so to do.

5. The Lessee shall not place nor permit any radio antennae, sound amplifiers, or similar devices on the roof or outside of the building(s) except with the written approval of the Lessor.

6. The Lessee shall keep the demised premises, the building(s), and all equipment therein, in good condition and repair. No additions to, or alterations of the building(s) shall be made, nor shall any additional building(s) be erected without the prior written approval of Lessor, which shall not be unreasonably withheld, nor shall any substantial change in the terrain of the premises be made without such approval.

7. The Lessee shall pay all charges assessed for the installation of telephones and the use of the telephone system.

8. The Lessee shall pay any and all taxes imposed by the Federal Government, the State or any political subdivision thereof.

#### ARTICLE VIII. UTILITIES

Electricity (for purposes other than heating) and water for the construction, maintenance, and/or operation of the Facility shall be furnished by the Lessor, and trash and garbage placed in container furnished by the Lessee, shall be removed by the Lessor. The aforesaid utilities and services shall be furnished by the Lessor at no additional cost to the Lessee, except that separate billing may be rendered therefor: provided, however, that neither the Lessor nor the Commission, nor any of their contractors, shall be liable at any time for any loss or damage due to interruption or failure in the furnishing of such services or utilities for any reason whatsoever; and provided further, that in the event the furnishing of said utilities and services is taken over by others than the Lessor, the Lessor shall be relieved of its obligations under this Article and the Lessee shall make payment directly to the persons, firms, or corporations furnishing any or all of said utilities or services, and in such event the Lessee's payments shall be equitably adjusted.

#### ARTICLE IX. SAFETY AND ACCIDENT PREVENTION

All activities in connection with the construction, maintenance, and/or operation of the Facility shall conform to all health and safety requirements and regulations of the Lessor and/or the Commission regardless of whether such activities be those of the Lessee or any of his contractors, or the officers, employees, or agents of the Lessee or of any of his contractors; and the Lessee shall take, or cause to be taken, all reasonable steps or precautions to protect health and minimize danger from all hazards to life and property, and shall make, or cause to be made, all reports and permit all inspections as provided in such regulations and requirements.

#### ARTICLE X. INDEMNITY AND INSURANCE

1. The Lessee shall indemnify and hold harmless the Lessor and the Commission from any and all liability whatsoever for injury to or death of persons or loss of or damage to property caused by or arising out of activities or non-feasance in connection with the construction, maintenance, and/or operation of the Facility, whether such activities be those of the Lessee or any of his con-

tractors, or the officers, employees, or agents of Lessee or of any of his contractors.

2. The Lessee shall maintain or shall cause to be maintained insurance in at least the following amounts: Public Liability for Bodily Injury, \$50,000/\$100,000; Public Liability for Property Damage, \$5,000; Automobile Public Liability for Bodily Injury, \$50,000/\$100,000; Automobile Public Liability for Property Damage, \$5,000, for purposes of providing protection against claims which may arise from activities in connection with the construction, maintenance, and/or operation of the Facility, whether such activities be those of the Lessee or any of his contractors, or the officers, employees, or agents of the Lessee or any of their contractors, and such other or additional insurance as will furnish reasonable protection against such claims, or other claims normally insured by newspaper publishers. Certificates of such insurance shall be filed with the Lessor, and the Lessor shall be given ten (10) days advance notice by mail of changes in or cancellation of any such insurance.

#### ARTICLE XI. COMPLIANCE WITH LAWS

The Lessee shall comply with The Industrial Insurance Act and the Medical Aid Act of the State of Washington, all Federal and State Social Security laws and all other Federal, State, and local laws, rules and regulations applicable to the construction, maintenance, and/or operation of the Facility, or to the Lessee as an owner or employer, and shall comply with such rules and regulations as the Lessor or the Commission may from time to time establish pertaining to the construction, maintenance, and/or operation of the Facility, or to the Lessee as an owner or employer, or to the health, sanitation, fire protection, and safety of the community; and the Lessee shall take the necessary steps to require compliance by his contractors and their officers, agents, and employees, with the foregoing laws, rules, and regulations.

#### ARTICLE XII. TERMINATION OR EXPIRATION

1. This Lease or any renewal hereof may be terminated by the Lessor, with the approval of the Commission, for the following reasons:

(a) Default in the payment of rent, when the Lessee is in default longer than ten days from the date the rent is due hereunder; or, default in the performance by the Lessee, his agents, contractors, or employees in respect to any of the terms, conditions or covenants of this Lease, whether or not such default is expressly declared to be a cause for termination elsewhere in this Lease; provided, however, that this Lease shall not be terminated for default (other than nonpayment of rent) if such default is remedied within ten days after written notice thereof has been given to the Lessee by the Lessor.

(b) The filing of a petition or similar proceeding under any bankruptcy or insolvency laws, either by or against the Lessee; the appointment of a receiver of the property of the Lessee; or the making by the Lessee of a general assignment for the benefit of his creditors.

(c) Abandonment of the premises by the Lessee.

(d) A radical change in the control, management, or composition of a corporate or partnership Lessee resulting in an operation, which, in the opinion of the Commission, is contrary to the Interest of the common defense and security.

2. In the event of termination or revocation by the Lessor for any of the reasons stated in Section 1 of this Article:

(a) The Lessee will be permitted to sell or otherwise dispose of the building(s), in place, for continued operation, within \_\_\_\_\_ days or as this time may be extended by the Lessor, to such person or persons, and upon such terms and conditions, (including protective conditions to insure payment by Lessee of damages, if any, under Paragraph (c) of this Section), as the Lessor and the Commission may approve in writing in advance.

(b) In the event that the Lessee does not sell or otherwise dispose of the building(s) under Paragraph (a) immediately preceding, title to the building(s) shall vest in the Government, without any compensation therefor.

(c) If termination is for any of the reasons specified in Section 1 of this Article, the Lessee shall be liable to the Lessor and/or the Commission for liquidated damages in an amount equal to the average of the monthly payments for the six-month period preceding the termination, multiplied by the

number of months not to exceed six (6) from and after the date the demised premises are vacated or abandoned by the Lessee until another Lessee takes possession thereof.

3. In addition to the right of the Lessor to terminate this Lease or any renewal thereof, under Section 1 of this Article, the Commission, through notice given by the Lessor, may revoke this Lease whenever in the opinion of the Commission, such termination is essential in the interest of the common defense and security.

4. In the event that revocation is effected under the provisions of Section 3 of this article and the Lessee is not in default of the provisions of this Lease or in violation of any law or regulation, which violation is the basis for such revocation, the Lessor, for and on behalf of the Commission, hereby agrees to purchase the Lessee's building(s) and the Lessee hereby agrees to sell said building(s) to the Lessor at the fair value thereof, as that term is hereinafter defined, provided, however, that the Lessor reserves the right to pay such sums as may be due hereunder to any holder of a valid lien, mortgage or encumbrance.

5. Upon expiration of the term of the Lease, or any renewal thereof, title to the building(s) erected upon the demised premises shall vest in the Commission, and the building(s) shall thereupon become part of the realty.

6. The term "fair value" as used in this Lease shall mean the actual original cost of the Lessee's building(s) to be purchased by the Lessor, less depreciation computed at ----- % per annum of the actual cost of the original building(s); and plus the actual cost of any authorized additional building(s) to be so purchased, less depreciation at fixed percentages per annum to be agreed upon in advance in writing by the parties hereto with respect to any such authorized additional building(s). The rate of depreciation provided for herein is based on the understanding and agreement of the parties hereto that the actual cost of the building(s) now contemplated for construction by Lessee shall be totally and completely amortized within a period of ----- years, and that any authorized additional building(s) shall be deemed totally and completely amortized within the period agreed upon pursuant to the provision of Section 7 of this Article. In the event that this period of amortization is changed at any time by written agreement of the parties hereto, the depreciation figure will be revised so that the total depreciation will be prorated on a per annum basis for the period of amortization.

7. At the time the Lessee submits the drawings, plans, and specifications of the original building(s) to the Lessor for approval, pursuant to Article VI, Section 1, the Lessor and Lessee shall agree in writing, subject to the approval of the Commission, upon the items which properly may be included in the actual cost of said building(s), and within ----- days after completion of said building(s), or as this time may be extended by the Lessor, the parties hereto shall agree in writing, subject to the approval of the Commission, as to the amount of the actual cost of said building(s); at the time approval is obtained to construct any additional building(s) pursuant to Article VII, Section 7, the Lessor and Lessee shall agree in writing, subject to the approval of the Commission, upon the items which properly may be included in the actual cost of said additional building(s), and within ----- days after completion of said additional building(s), or as this time may be extended by the Lessor, the parties hereto shall agree in writing, subject to the approval of the Commission, as to the amount of the actual cost of said additional building(s) and as to the period within which said additional building(s) shall be totally and completely amortized.

8. In any case where the Lessor on behalf of the Commission purchases Lessee's building(s), or the title thereto is to vest in the Commission, the building(s) shall become part of the realty and shall become the absolute property of the Commission, at time that payment is made, if the transfer of title occurs prior to the expiration of the amortization period, or on the date fixed for termination or revocation, if no payment is to be made. The Lessee covenants to execute, acknowledge and deliver any and all documents of title and to take all necessary steps to transfer of title, free and clear of all liens, encumbrances and charges, other than those expressly authorized and validly existing under the provisions of Article V, Section 2.

9. Upon termination, revocation, or expiration of this Lease or any renewal hereof, the Lessee shall, at the request of Lessor, surrender possession and vacate the premises, remove all his property therefrom, and deliver possession of the premises to the Lessor, and hereby grants to the Lessor or the Commission full and free right to enter into and upon the premises in such event, with or

without process of law, and to take possession of the premises and to expel or remove Lessee and any others who may be occupying the premises and to remove any and all property therefrom using such force as may be necessary, without being deemed guilty of trespass, eviction or forcible entry or detainer, and without relinquishing Lessor's rights to payments or any other right given to Lessor hereunder or by operation of law.

#### ARTICLE XIII. LESSEE'S RIGHTS UPON SALE OF PREMISES

The Lessor hereby covenants that the demised premises will not be sold during the term of this Lease unless and until the Lessee shall have been given notice of the intention to sell said premises and shall have been given a period of \_\_\_\_\_ days in which to make an offer for said premises, and the Lessor further covenants that, in the event this offer is not accepted, no such sale will thereafter be made unless and until the Lessee shall have been notified of the best offer received by the Lessor or the Commission for said premises and shall have been given an additional period of \_\_\_\_\_ days in which to make a further offer.

#### ARTICLE XIV. LIMITATION

Lessor is not and never shall be liable to any creditor of Lessee or to any claimant against the estate or property of Lessee for any debt, loss, contract or other obligation of Lessee.

#### ARTICLE XV. DISPUTES

All disputes concerning questions of fact, which may arise hereunder and which are not disposed of by mutual agreement, may be referred to arbitration, in which event the Lessee and the Lessor and/or the Commission shall each designate or appoint an arbitrator, the two arbitrators to select a third arbitrator, and the ruling following such arbitration to be final and accepted by all parties. Pending decision of a dispute hereunder, the Lessee shall diligently proceed under this Lease as construed by Lessor, unless otherwise authorized by the Commission.

#### ARTICLE XVI. ACTS OF SOVEREIGN

Neither the Lessor nor the Commission nor any of their agents, employees nor contractors shall be liable for any interruption of the Lessee's business or interference therewith which may result from the repair, relocation, changing of grade or closing down or opening of any streets, roads, or highways.

#### ARTICLE XVII. FIRE OR OTHER CASUALTY

If the building(s) are totally or partially damaged or destroyed by fire, Acts of God or other casualty, the Lessee shall rebuild, repair, reinstall or rehabilitate the building (s) at the Lessee's expense, subject to the approval of the Lessor in accordance with the provisions of Article VI (Construction), in which event payment by the Lessee shall be equitably adjusted.

#### ARTICLE XVIII. NOTICES

In every instance where it shall be necessary or desirable for Lessor to serve any notice or demand upon Lessee, it shall be sufficient either (a) to deliver or cause to be delivered to Lessee a written or printed copy thereof, or (b) to send a written or printed copy thereof by United States registered mail, postage prepaid, addressed to Lessee at the demised premises, in which event the notice or demand shall be deemed for all purposes to have been served at the time the copy is mailed, or (c) to leave a written or printed copy thereof with any person residing on or in possession of the demised premises or to affix the same upon any door leading into any building upon the demised premises, in which event the notice or demand shall be deemed to have been served at the time the copy is so left or affixed.

#### ARTICLE XIX. MISCELLANEOUS

1. No receipt of money by the Lessor from Lessee after the termination of this Lease or after the service of any notice or after the commencement of any suit, or after final judgment for possession of the demised premises, shall renew, re-

instate, continue or extend the term of this Lease or affect any such notice demand or suit.

2. Failure of the Lessor to take any action with respect to any default by the Lessee hereunder shall not constitute a waiver of any of the Lessor's rights under this Lease, and no express waiver shall affect any default other than the default specified in the express waiver and that only for the time and to the extent therein stated.

3. The invalidity or unenforceability of any provision herein shall not affect or impair any other provision in this Lease.

4. Provisions inserted herein or affixed hereto shall not be valid unless appearing in the executed copy hereof in the possession of the Lessor, and in event of variation or discrepancy, Lessor's duplicate original shall control.

5. Except as otherwise herein provided, each provision hereof shall extend to and shall, as the case may require, bind and inure to the benefit of Lessor and Lessee and their respective heirs, legal representatives, successors and assigns.

6. The headings of Articles, Sections and Paragraphs are for convenience only and do not define, limit or construe the contents thereof.

#### ARTICLE XX. RESERVED RIGHTS

Lessor reserves the following rights:

1. To change the name of the street or address of the building(s) without prior notice thereof or liability to Lessee.

2. To enter the premises or any part thereof at reasonable hours to make inspections, to exhibit the premises to prospective tenants, purchasers or others, and to perform, consistently with this Lease, any acts related to the safety, protection, preservation, sale or improvement of the premises or the building(s).

3. To construct, operate, maintain, inspect, repair, relocate and remove any sewer, water, telephone, electrical and other utility and municipal service lines or installations, including the necessary poles and fixtures, with right of ingress and egress to and from the same on, over and through the premises herein demised.

#### ARTICLE XXI. DEFAULT UNDER OTHER LICENSE AGREEMENT OR LEASE

If the term of any License Agreement or Lease, other than this Lease, made by Lessee and Lessor, be terminated of terminable after the execution of this Lease because on any default by Lessee under such other License Agreement or Lease, the Lessor, at its option, may either terminate this Lease or add any sums due to Lessor under the other License Agreement or Lease to the amount payable under this Lease.

#### ARTICLE XXII. HOLDING-OVER

Lessee shall pay to Lessor, as liquidated damages, a sum equal to double the amount of the monthly payments as computed under the terms of this Lease or a sum equal to double the average monthly payments for the six-month period immediately preceding the date the holding-over begins, whichever is greater, for each month the Lessee retains unauthorized possession of the premises or building(s) in violation of the terms of this Lease. For any period of holding-over for less than a month, the amount of liquidated damages as above computed will be prorated on a per diem basis. Lessor's acceptance of any payments after holding-over begins does not renew this Lease. This provision does not waive Lessor's right of re-entry or any other right hereunder.

#### ARTICLE XXIII. LITIGATION COSTS

Lessee shall pay upon demand all of Lessor's costs, charges and expenses, including the fees of counsel, agents and others retained by Lessor, incurred in enforcing Lessee's obligations hereunder or incurred by Lessor in any litigation, negotiation or transaction in which Lessee causes Lessor, without Lessor's fault, to become involved or concerned.

#### ARTICLE XXIV. RENEGOTIATION

The Lessor or Lessee shall have the right to require renegotiation of the rent payable hereunder and adjustment of the amounts thereof at the end of each five-year period of this Lease or any renewal hereof. If the Lessor and the Lessee are unable to agree, after renegotiation, on the amounts, if any, by

which such payments should be adjusted, the question may be referred to arbitration under the provisions of Article XVI (DISPUTES) herein; provided, however, that pending the determination of such a dispute the Lessee shall pay as rent hereunder the amount fixed by the Lessor.

#### ARTICLE XXV. INTEGRATION CLAUSE

This Lease contains the entire understanding between the parties, and there are no understandings, representations, or warranties not set forth or incorporated by reference herein. No subsequent modification of this Lease shall be of any force or effect unless in writing, signed by the party claimed to be bound hereby.

#### ARTICLE XXVI. RIGHT TO OPERATE BUSINESS NOT EXCLUSIVE

The Lessor reserves the right to grant leases or licenses to others to operate similar or identical business at the Hanford Works, or to permit the conduct of similar or identical businesses under any other arrangement.

#### ARTICLE XXVII. ANTIDISCRIMINATION

The Lessee shall not discriminate against any employee or applicant for employment because of race, creed, color or national origin.

#### ARTICLE XXVIII. COVENANT AGAINST CONTINGENT FEES

The Lessee warrants that no person has been employed to solicit or assist in obtaining this Lease upon any agreement for a commission, percentage, brokerage or contingent fee. This warranty shall not apply to commissions payable by Lessee upon contracts or sales secured or made through bona fide commercial or selling agencies maintained by the Lessee for the purpose of securing business.

#### ARTICLE XXIX. OFFICIALS NOT TO BENEFIT

No member of or delegate to Congress nor Resident Commissioner shall be admitted to any share or part of this Lease nor to any benefit that may arise therefrom, but this provision shall not be construed to extend to this Lease if made with a corporation for its general benefit.

#### ARTICLE XXX. SECURITY CLEARANCE AND EMPLOYEES

1. Lessee shall comply with all regulations and rules in effect on the Hanford Works regarding passes, badges, lists of employees and conduct on the property, and shall take the necessary steps to require compliance by his contractors and their officers, agents and employees with such rules and regulations.

2. The Lessee shall submit to the Lessor the names of all persons to be employed in connection with the construction of the building(s) and operation of the Facility. The Lessee shall also promptly notify the Lessor of all employee terminations. The Lessor may, with the approval of the Commission, refuse to allow the employment of any person, if, in the opinion of the Commission, such employment would be prejudicial to the interest of the common defense and security.

3. Unless otherwise authorized by the Lessor, all persons employed in the construction of the building(s) and operation of the Facility will be required to obtain security clearance before performing any work, and the Lessor, with the approval of the Commission, may require dismissal from the work of any employee whose employment is deemed prejudicial to the interest of the common defense and security, subject to right of appeal by the Lessee to the Commission for reinstatement of any such employee in the event such action shall be taken.

#### ARTICLE XXXI. APPROVAL OF COMMISSION

This Lease shall be subject to the written approval of the Commission and shall not be binding until so approved.

#### ARTICLE XXXII. DEFINITIONS

1. As used in this Lease, the terms "United States Atomic Energy Commission" and "Commission" shall mean the United States Atomic Energy Commission or its duly authorized representative or representatives.

2. The term "building(s)" as used herein shall mean all structures, tenements, and appurtenances constructed on the demised premises and such fixtures as are affixed thereto so as to become a part thereof, and not be severable wholly or in any portion without material injury to the freehold.

ARTICLE XXXIII. AVAILABILITY OF FUNDS

Any contingent liability or obligation for future payments assumed hereunder by the Lessor and/or the Commission shall be subject to the availability of funds appropriated by Congress, for the discharge of said obligation.

ARTICLE XXXIV. ASSIGNMENT TO COMMISSION

This Lease may be assigned at any time by the Lessor to the Commission or its designee and by such assignment the Lessor is relieved from all liability to the Lessee under this Lease.

ARTICLE XXXV. FREE PRESS

Nothing herein contained shall be construed to authorize the Lessor or Commission to control Lessee's editorial policy in any way, or to restrict Lessee's right to publish any information or other matter, disclosure of which is not prohibited by law.

ARTICLE XXXVI. ALTERATIONS

The following changes were made in this Lease before it was signed by the parties hereto:

IN WITNESS WHEREOF the parties have caused this Lease to be executed on the day and year first hereinbefore written.

APPROVED:

UNITED STATES ATOMIC ENERGY COMMISSION,

By \_\_\_\_\_  
Manager, Hanford Operations Office

Date\_\_\_\_\_

BID—COMMERCIAL FACILITY—LOCAL NEWSPAPER, RICHLAND, WASHINGTON

I. In compliance with your Invitation to Bid, dated\_\_\_\_\_, 1949, and subject to all the terms and conditions thereof, we submit on the following consecutively numbered pages this Bid for a lease to construct and equip the necessary building(s), and to edit, publish, and print a local newspaper in Richland, Washington.

II. We will construct the building(s) at our expense, in accordance with the terms and conditions contained in the Invitation to Bid, the Lease form, and in a manner prescribed by General Electric.

III. A. We will pay General Electric, from and after the date fixed for commencement of operations as specified in Article IX of this Bid, monthly compensation in return for ground use, water, electricity (for all purposes other than heat), and for other services to be provided by General Electric as outlined in the Lease form, as follows:

B. In addition to monthly compensation set forth in Section A immediately preceding, we will pay reasonable building permit and other construction fees, payable to General Electric upon receipt of building permit, to cover the cost to General Electric of furnishing electricity and water during the course of con-

struction of the building(s), inspecting drawings and specifications, and making inspections during course of construction to assure compliance with all building codes and zoning regulations specified by General Electric and the Commission.

IV. We request that the tenure of the Lease be for the following period:

Check (x) one only:

1. 10 years -----
2. 15 years -----
3. 20 years -----
4. -----

We request that we be given an option to renew the Lease for a term of ----- years, which period shall not exceed the original period.

V. Information on the building(s) we propose to construct at our expense is provided below:

A. Type of Construction (Must conform to requirements of Uniform Building Code, 1949 Edition, Pacific Coast Building Officials Conference; National Electrical Code & State of Washington Electrical Code, as revised locally; and Uniform Plumbing Code, 2nd Edition, Western Plumbing Officials Association, all of which are on file in the General Electric Community Engineering Office at Richland):

B. Building Dimensions (attach rough perspective pencil drawing and sketch indicating lay-out and plot plan):

C. Estimated Construction cost:

VI. (List below, or on attached pages, type and capacity of equipment which you would propose to install, together with approximate cost):

VII. (Submit specific information as to your ability to obtain necessary equipment to meet the completion date set by you):

VIII. (List below, or on attached pages, any special services proposed, in addition to publishing the newspaper, such as commercial printing, sale of stationery and office supplies, or subrental space.)

IX. In the event we are awarded this Bid, we will construct the building(s) within a maximum of ----- days after receipt of formal notice to proceed, and we will commence operations within ----- days from the time the building(s) are completed by us.

X. In the event we are awarded this Bid, the business will be operated under the name of -----

XI. In the event we are awarded this Bid, we agree to procure all necessary licenses and permits and comply with all Federal, State, and local laws applicable to the business or to the operation thereof, or to us as an owner or employer, and to abide by such rules and regulations as General Electric or the Commission may from time to time establish pertaining to the health, sanitation, fire protection, and safety of the residents of Richland.

XII. In the event we are awarded this Bid, we agree promptly to execute a Lease with General Electric, containing substantially the same provisions as those in the accompanying instrument. It is understood that all agreements entered into by and between the Successful Bidder and General Electric shall be subject to the written approval of the Commission.

XIII. In the event we are awarded this Bid, our sources of loan for construction of the building(s) will be as follows: -----

XIV. In the event we are awarded this Bid, the business will be operated as:

A. An individual enterprise ( ).

B. A Partnership ( ). If a partnership, show names and addresses of partners: -----

C. A corporation ( ). If a corporation, show names and addresses of proposed officers: -----

(Attached hereto and made a part hereof is a "Declaration of Ownership" form to be executed and returned by the Bidder.)

XV. We attach hereto and make a part hereof a current financial statement as of -----, 1949.
